

# RTLSDR: driver extensions

RTL2832U + Tuner  
driver extensions

64<sup>th</sup> VHF conference in  
Weinheim/Germany (2019-09-07)  
Stripped/Updated: 2020-08-29

# Overview

- RTLSDR
- development
- “driver” ?
- new features – specific to R820T/2 tuner
- experiences in practice
- outlook

# RTLSDR: a toy?

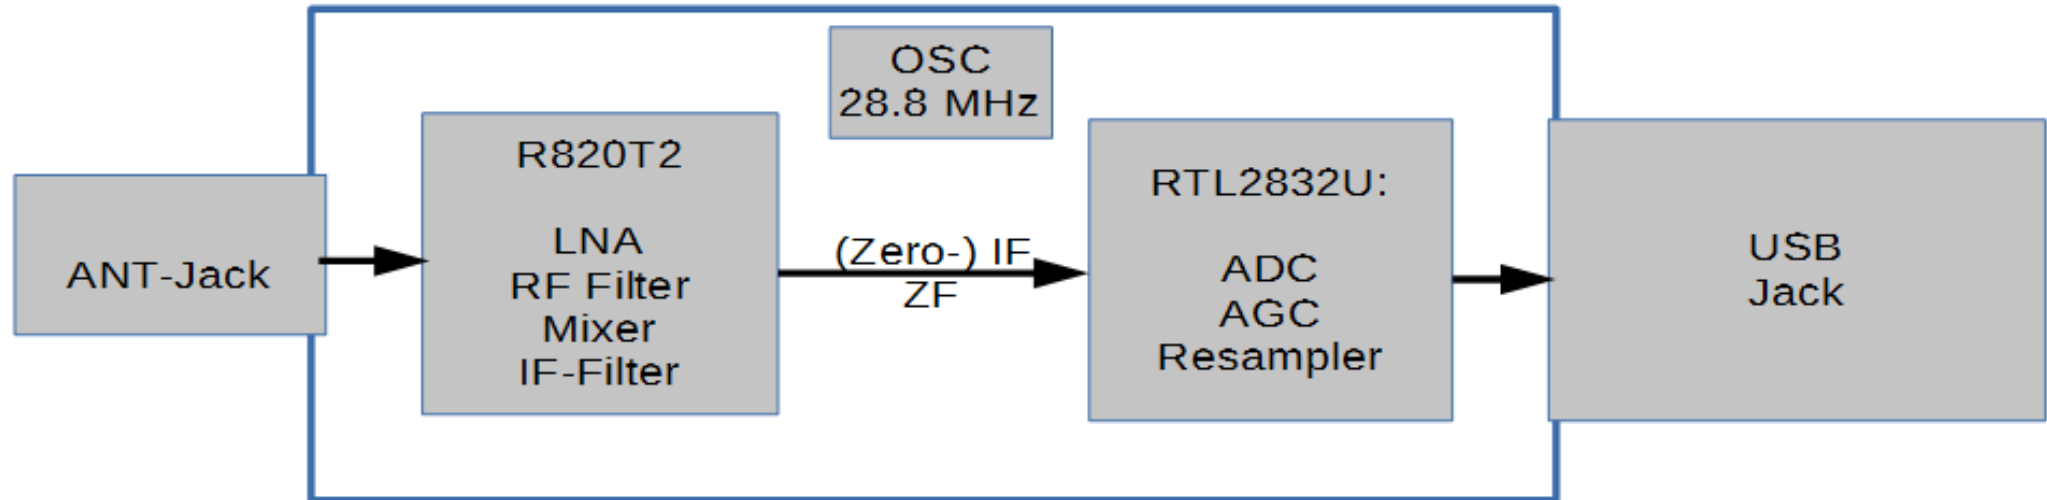

- DVB/DAB dongles with “RTL2832U” A/D converter chip (with E4000 or) R820T - better R820T2 - tuner
- R820T/2: 24 – 1766 MHz
- some with TCXO
- additional up-converter required for HF frequencies < 24 MHz or aliased “direct sampling” mode with V3 from RTL-SDR.com
- 8 Bit dynamic-range - improved by processing gain
- ~ 2.5 MHz bandwidth

# RTLSDR: one of many different designs

# RTLSDR: simple block diagram: Tuner + RTL2832U

# RTLSDR: supported tuners

- **tuner determines important features:**
  - frequency range(s) and gaps
  - AGC und possible manual gain settings
  - HF/RF- and also IF-filters
  - [ housing, construction, quartz are also important ]
- **Rafael Micro:    R828D    R820T    R820T2**
- **Elonics:            E4000 (E4K)**
- **a few more, e.g. Fiticom FC0013**

# RTLSDR: Rafael Micro R820T2-Tuner

# Development (1)

- worldwide Open Source development often using <https://github.com/>
- Base Team: OSMOCOM is often included in Linux distributions: <https://osmocom.org/projects/rtl-sdr/wiki/Rtl-sdr>

Github “Mirror”:

<https://github.com/osmocom/rtl-sdr>

patches only by email to mailing list .. IMHO quite restrictive

## Development (2)

- worldwide Open Source development often using <https://github.com/>

some of the many developers or developments:

- <https://github.com/mutability/librtlsdr>
- <https://github.com/keenerd/rtl-sdr>
- <https://github.com/dl8aau/librtlsdr>
- <https://github.com/librtlsdr/librtlsdr>

## Development (3)

own development with driver extensions  
in “development” branch

<https://github.com/hayguen/librtlsdr/tree/development>  
of <https://github.com/hayguen/librtlsdr>

~~should be~~ meanwhile integrated “soon” into  
<https://github.com/librtlsdr/librtlsdr>  
on the development branch

should be integrated “soon” into the master branch

# “driver” ? (1)

- **Strictly speaking, this is not a system-driver!**
    - but only a software libraryunder free GPL license
  - **Library:**
    - shared library: .DLL on Windows, .so on Linux
    - static library: .lib or .a linkable (integrable) into GPL-programs
    - needs LibUSB with access on OS / driver
- ➔ **Zadig driver required on Windows, that LibUSB works**  
<https://zadig.akeo.ie/>

## “driver” ? (2)

- **Library contains some helper programs / tools for use at command line:**
  - rtl\_fm            demodulation – NOT just FM
  - rtl\_sdr           streaming to pipe or saving to file
  - rtl\_tcp           streaming to network  
– mandatory for non-GPL programs
  - rtl\_test           test / identification
  - rtl\_eeprom       firmware modifications, including serial number
  - rtl\_raw2wav      new: convert rtl\_sdr recordings into WAV
  - ..                 some more

# New features (1): background

In the context of the FMLIST-Scanner

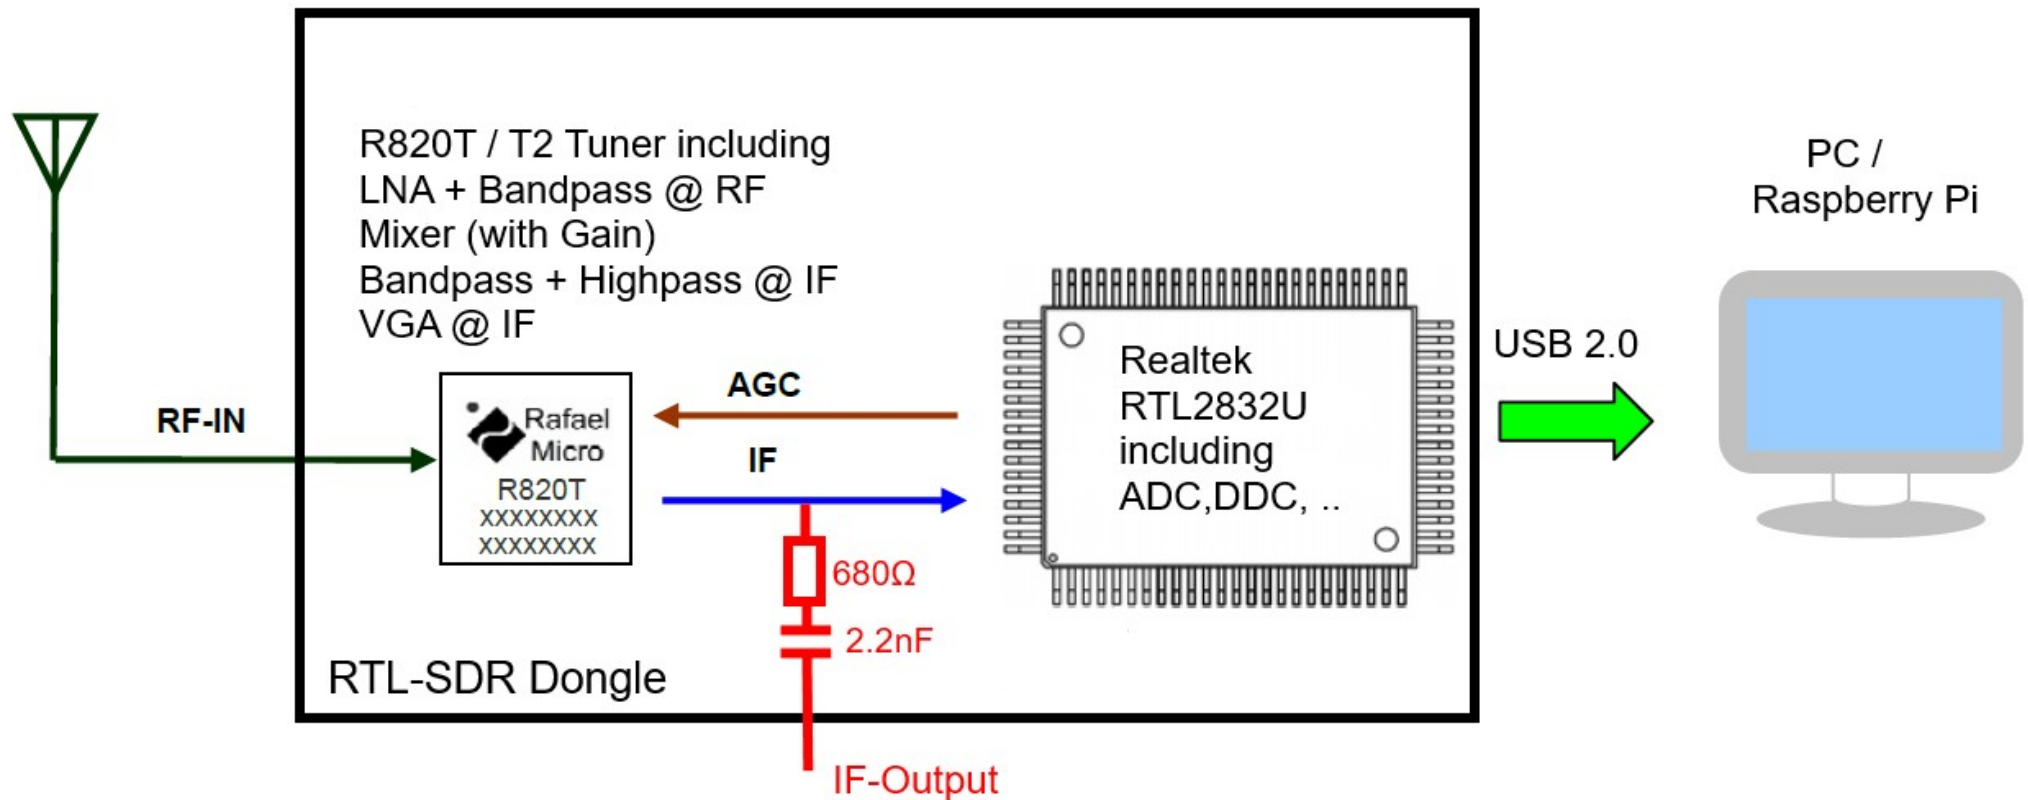

[https://github.com/hayguen/fmlist\\_scan](https://github.com/hayguen/fmlist_scan)

[https://codingspirit.de/fmlist\\_scan\\_Step-by-Step.pdf](https://codingspirit.de/fmlist_scan_Step-by-Step.pdf)

performance (“sensitivity”) deficits were found for FM (in fact: selectivity problems in combination with 8-bit ADC). For DAB there were no such problem reports.

- The developer of QIRX (a DAB+ Software Defined Radio for Windows) also had desire for improvements  
<https://softsyst.com/qirx>

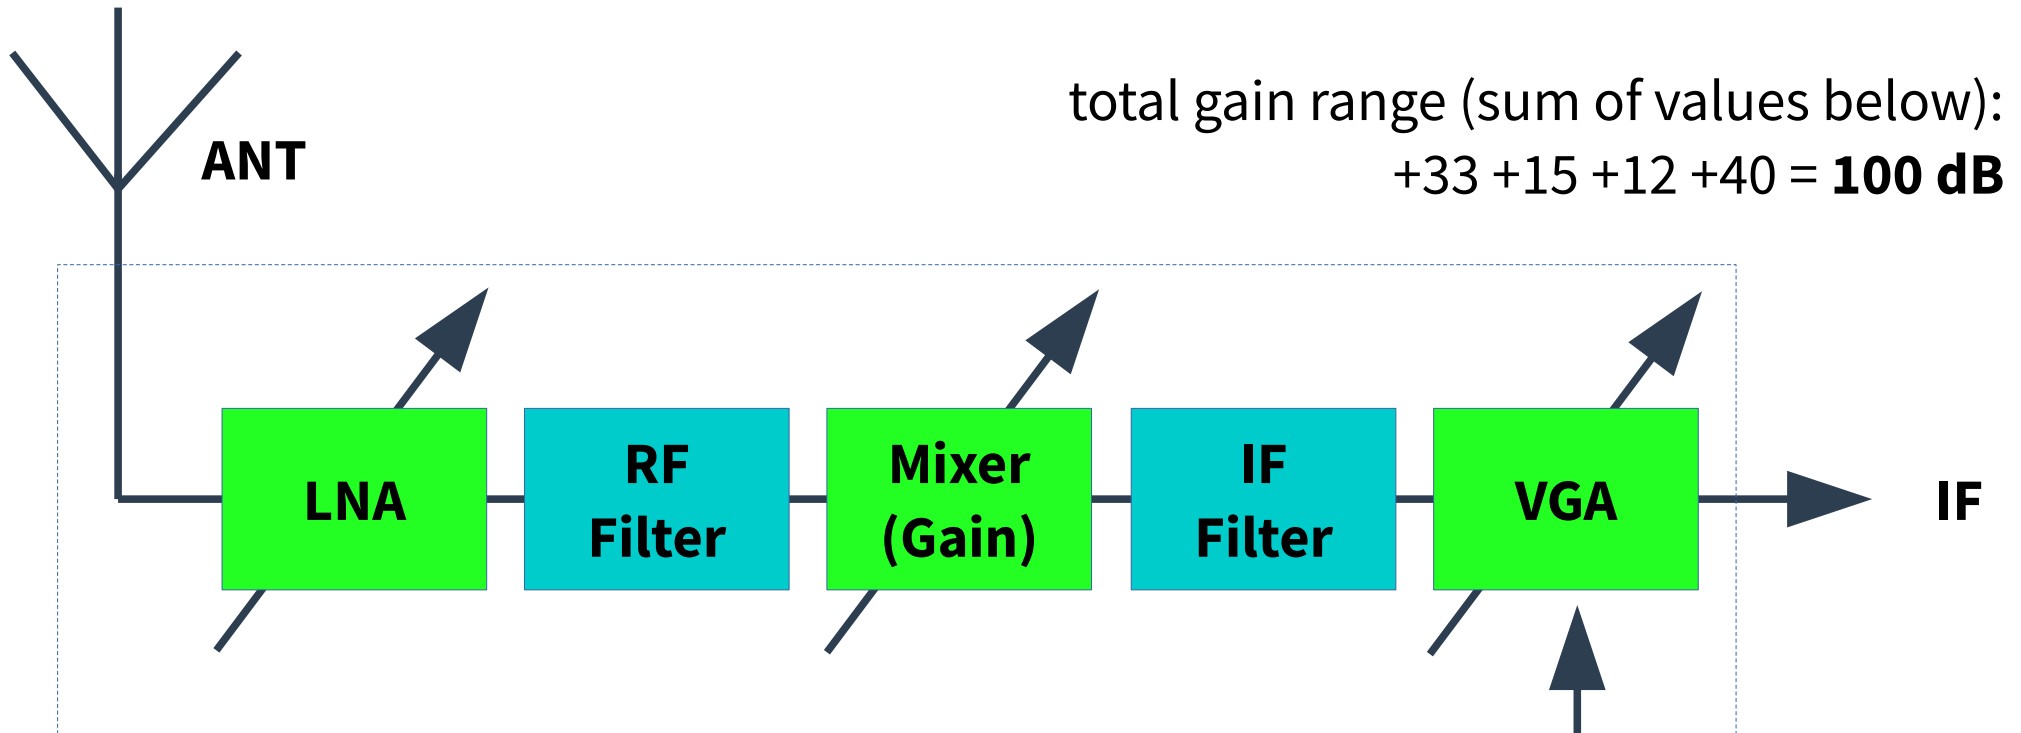

# New features (2): development required an IF output for measurements, e.g. filters

# New features (3): block diagram of R820T/2 tuner

# New features (4): block diagram of R820T/2 tuner

LNA	Low Noise Amplifier	~	0 .. +33 dB
Mixer	Mixer with Gain	~	0 .. +15 dB
VGA	Variable Gain Amplifier	~	-12 .. +40 dB
RF Filter	Radio Frequency preselection filter		
IF Filter	Intermediate Frequency bandpass filter		

**optional control**  
**VAGC**

# New features (5): previous work on IF bandwidth

- Leif Asbrink, SM5BSZ and Alexander Kurpiers, DL8AAU

in the IF (from Tuner to ADC in RTL2832)  
always ~ 1500 kHz in 3-dB point

# New features (6): previous work on IF bandwidth

utilize Lowpass filter of tuner

## New features (7): new information

- Leaked document with I2C-register descriptions  
[http://www.superkuh.com/R820T2\\_Register\\_Description.pdf](http://www.superkuh.com/R820T2_Register_Description.pdf)
- Superkuh website is interesting in general:  
<http://superkuh.com/rtlsdr.html>
- „Playing with the Airspy R820T IF bandwidth“  
of Thierry Leconte:  
<https://tleconte.github.io/R820T/r820IF.html>

# New features (8): new information

- „Playing with the Airspy R820T IF bandwidth“  
of Thierry Leconte:  
<https://tleconte.github.io/R820T/r820IF.html>

# New features (9): new filters

noticing of the I2C-bit described with  
"Filter extension under weak signal" (Manuel Lausch)

~ 600 kHz 3-dB bandwidth:

# New features (10): new filters

noticing of the I2C-bit described with  
"Filter extension under weak signal" (Manuel Lausch)

~ 300 kHz 3-dB bandwidth:

# New features (11): new filters

# New features (12): new filters

noticing of the I2C-bit described with  
"Filter extension under weak signal"

WTF is this good for?! Default initialization produced problems

~ 3200 kHz 3-dB bandwidth:

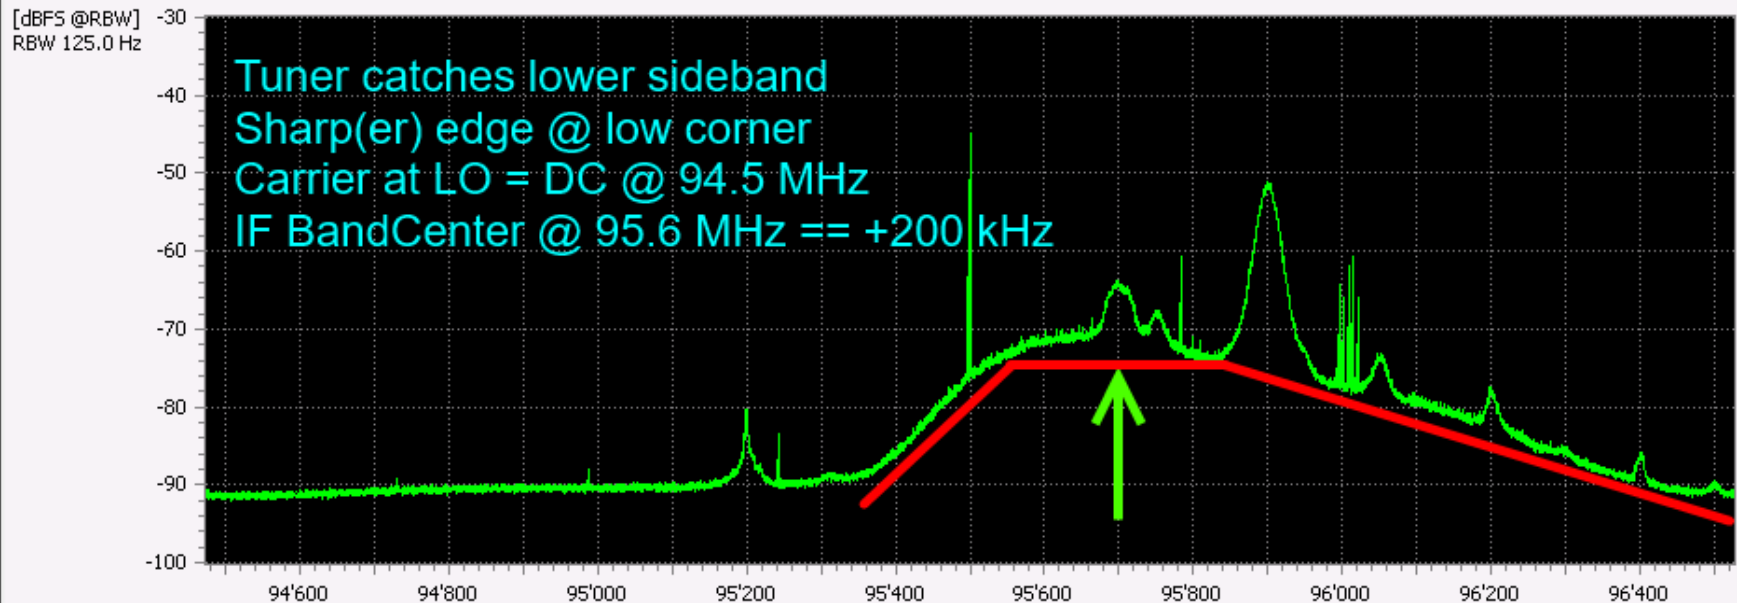

## **New features (13): new information**

- **flip the spectrum in R820T – tuner**  
**possible with one I2C-bit, discovered by Bernhard, DB9PP**
- + flip back in RTL2832 (for always getting correct frequencies)**
- allows selection of sideband,**  
**on which steeper lowpass filter is to be applied**
- **new idea: setting / shift**  
**center of IF-filter**

# New features (14): sideband selection

→ better attenuation for 2 FM stations (left of DC)

# **New features (15): new gain control**

**Bernhard + Oldenburger:**

- **explicit utilization of VGA control – after IF-filter (previously set on a fixed setting/value)**
- **control of VGA through RTL2832U → AGC together with Digital AGC in RTL2832 → (nearly) no more oversteerings**

# Practical experience with the FMLIST-Scanner

- reception of DAB channel, having strong neighbor channel, now possible – enabled through more bandwidth options and sideband selection, leading to better selectivity
- (most) alias signals (in FM band) vanished, by utilizing all AGCs (LNA, Mixer, VGA and Digital AGC)
- more FM stations produce RDS decoding results (redsea), probably a combination of selectivity and better AGC behavior

# Outlook for future development

- more robust AGC control?
- measure input level in dBm or dB $\mu$ V  
at least support measurement despite active (LNA/Mixer) AGC
