Maintenance for R7si

555-233-105
Comcode 108343310
Issue 1
June 1999

Notice

Every effort was made to ensure that the information in this book was complete and accurate at the time of printing. However, information is subject to change.

Your Responsibility for Your System's Security

Toll fraud is the unauthorized use of your telecommunications system by an unauthorized party, for example, persons other than your company's employees, agents, subcontractors, or persons working on your company's behalf. Note that there may be a risk of toll fraud associated with your telecommunications system and, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

You and your system manager are responsible for the security of your system, such as programming and configuring your equipment to prevent unauthorized use. The system manager is also responsible for reading all installation, instruction, and system administration documents provided with this product in order to fully understand the features that can introduce risk of toll fraud and the steps that can be taken to reduce that risk. Lucent Technologies does not warrant that this product is immune from or will prevent unauthorized use of common-carrier telecommunication services or facilities accessed through or connected to it. Lucent Technologies will not be responsible for any charges that result from such unauthorized use.

Lucent Technologies Fraud Intervention

If you *suspect that you are being victimized* by toll fraud and you need technical support or assistance, call Technical Service Center Toll Fraud Intervention Hotline at 1 800 643-2353 or contact your local Lucent representative.

Federal Communications Commission Statement

Part 15: Class A Statement. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Part 68: Network Registration Number. This equipment is registered with the FCC in accordance with Part 68 of the FCC Rules. It is identified by FCC registration number AS593M-13283-MF-E.

Part 68: Answer-Supervision Signaling. Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 Rules. This equipment returns answer-supervision signals to the public switched network when:

- Answered by the called station
- Answered by the attendant
- Routed to a recorded announcement that can be administered by the CPE user

This equipment returns answer-supervision signals on all DID calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered
- A busy tone is received
- A reorder tone is received

Canadian Department of Communications (DOC) Interference Information

This digital apparatus does not exceed the Class A limits for radio noise emissions set out in the radio interference regulations of the Canadian Department of Communications.

Le Présent Appareil Numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la class A prescrites dans le règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

Ordering Information

Call: Lucent Technologies BCS Publications Center
Voice 1 800 457-1235 International Voice 317 322-6416
Fax 1 800 457-1764 International Fax 317 322-6699

Write: Lucent Technologies BCS Publications Center
2855 N. Franklin Road
Indianapolis, IN 46219

Order: Document No. 555-233-105
Comcode 108343310
Issue 1, June 1999

For additional documents, refer to the section in "About This Document" entitled "Related Resources."

You can be placed on a standing order list for this and other documents you may need. Standing order will enable you to automatically receive updated versions of individual documents or document sets, billed to account information that you provide. For more information on standing orders, or to be put on a list to receive future issues of this document, contact the Lucent Technologies Publications Center.

European Union Declaration of Conformity

The "CE" mark affixed to the DEFINITY® equipment described in this book indicates that the equipment conforms to the following European Union (EU) Directives:

- Electromagnetic Compatibility (89/336/EEC)
- Low Voltage (73/23/EEC)
- Telecommunications Terminal Equipment (TTE) i-CTR3 BRI and i-CTR4 PRI

For more information on standards compliance, contact your local distributor.

Comments

To comment on this document, return the comment card at the front of the document or email us at document@drmail.lucent.com.

About this Book

General

This book has the information needed to monitor, test, and maintain DEFINITY® Enterprise Communications Server Release 7 systems and covers many of the faults and troubles that can occur in the system. Most maintenance requirements are simple procedures due to the modular, self-testing nature of the system.

This document covers information related to DEFINITY ECS Release 7, including all incremental releases.

Simple, traditional troubleshooting methods are sometimes sufficient to locate and clear faults. The traditional methods include terminal substitution, visual inspections, continuity checks, and clarification of operating procedures with users.

The information in this book is intended for use by:

- A maintenance technician dispatched to a DEFINITY System site in response to a trouble alarm or a user trouble report,
- A maintenance technician located at a remote maintenance facility, or
- The user's assigned maintenance technician. The technician is expected to have a knowledge of telecommunications fundamentals and of the DEFINITY Enterprise Communications Server Release 7 systems to the extent that the procedures in this book can be performed, in most cases, without assistance.

Each DEFINITY System has a user-designated System Manager who is responsible for administration of the system. The maintenance technician should work closely with the user's System Manager.

This book is not intended to solve all levels of troubles. It is limited to troubles that can be solved by using the Alarm Log, Error Log, trouble-clearing procedures, maintenance tests, and traditional troubleshooting methods. If the trouble still has not been resolved, it is the responsibility of the maintenance technician to escalate the problem to a higher level of technical support. Escalation should conform to the procedures in the *Technical and Administration Escalation Plan*.

When features, screen displays, equipment, or operations differ between system types, for example, Generic 3 V4, Release 5si, or Release 5si + memory, these differences are clearly identified by use of the following indicators: “[G3V4]”, “[R5si]”, or “[R5 si + memory].”

Conventions Used in This Document

The following conventions are used in this document:

- DEFINITY Systems are called G3V4, Release 5; Release 5vs, Release 5si, Release 5si + memory, Release 6, and Release 7.
 - All occurrences of G3siV4, G3siV4+m, Release 5si, and Release 5 si + memory are called Release 5si unless a specific configuration is required to differentiate among product offerings.
 - All occurrences of R5 without a suffix following the “5” refer to Release 5si, and Release 5si + memory.
- A component of a DEFINITY System, such as a circuit pack, occurring without a reference to any specific system, is part of G3V4 or Release 5.
- The term “ASAI” is synonymous with the newer CallVisor ASAI.
- All physical dimensions in this book are in English (Foot Pound Second) (FPS) followed by the metric Centimeter Grams Second (CGS) in parenthesis. Wire gauge measurements are in AWG followed by the diameter in millimeters in parenthesis.
- Information you type at the management terminal is shown in the following typeface: **list system-parameters maintenance**
- Information displayed on the management terminal screen is shown in the following typeface: `login`
- Keyboard keys are shown in the following typeface: `Enter`.
- Circuit pack codes (such as TN790 or TN2182B) are shown with the minimum acceptable alphabetic suffix (like the “B” in the code TN2182B).

Generally, an alphabetic suffix higher than that shown is also acceptable. However, not every *vintage* of either the minimum suffix or a higher suffix code is necessarily acceptable.

 **NOTE:**

Refer to *Technical Monthly: Reference Guide for Circuit Pack Vintages and Change Notices*, for current information about the usable vintages of specific circuit pack codes (including the suffix) in a Release 7 system.

- Admonishments used in this book are as follows:

CAUTION:

This sign is used to indicate possible harm to software, possible loss of data, or possible service interruptions.

WARNING:

This sign is used where there is possible harm to hardware or equipment.

DANGER:

This sign is used to indicate possible harm or injury to people.

Organization

This book is organized into two volumes: Volume 1 contains Chapters 1 through 9 and part of Chapter 10, and volume 2 contains the remainder of Chapter 10.

- [Chapter 1, “Maintenance Architecture”](#) describes the system’s design and maintenance strategy.
- [Chapter 2, “Circuit Packs and Power”](#) describes DEFINITY circuit packs. It also explains how power is supplied to the system.
- [Chapter 3, “Management Terminals”](#) describes the various management terminals that can be used on the system and how to set up the terminals.
- [Chapter 4, “Initialization and Recovery”](#) describes the various reset and reboot processes, and discusses how these processes are used to perform maintenance and to recover systems or subsystems that are out of service.
- [Chapter 5, “Routine Maintenance Procedures”](#) discusses common maintenance tasks, including: removing and installing circuit packs, removing and restoring power, performing system backups, upgrading software, and various testing and troubleshooting procedures.
- [Chapter 6, “Reliability Systems: A Maintenance Aid”](#) provides detailed hardware and functional descriptions as well as additional repair strategy (in addition to the procedures provided in this document) for Standard, High, and Critical Reliability systems.

- [Chapter 7, “LED Interpretation”](#) is a quick reference to interpreting circuit pack LEDs.
- [Chapter 8, “Maintenance Commands and Trouble-Clearing Aids”](#) has the maintenance commands, and explains how to use these commands using the management terminal. Specific command syntax plus typical forms and display output are also given in the chapter.
- [Chapter 9, “Packet Bus Fault Isolation and Correction”](#) describes Pack Bus maintenance and the interactions of the bus with Packet circuit packs. The chapter also discusses how Packet Bus faults are isolated and corrected.
- [Chapter 10, “Maintenance Object Repair Procedures”](#) has specific troubleshooting and repair instructions for every component in the system. The chapter contains repair procedures for system-alarmed and user-reported troubles. For each MO, a table lists the alarm level, hardware error associated with the MO, and the associated test that caused the error. The test sequences and the specific command line entry required to run the tests are given and a brief description of each test. Explanations of error codes associated with each test are given, as are specific maintenance procedures to be used to resolve each problem.

Each MO is described in a separate section of [Chapter 10, “Maintenance Object Repair Procedures”](#). The individual sections are labeled with the name of the MO exactly as the name appears in the Alarm Log; for example, MAINT (for Maintenance circuit pack). The only exception is the MO name for Common Port Circuit Pack maintenance which is XXX-BD. The XXX-BD section contains a set of common tests used by certain circuit packs listed in the section. The common portion of these circuit packs is the generic hardware that interfaces with the Time Division Multiplex (TDM) Bus.

Lucent Technologies listens carefully to its readers. The organization of this book is a direct result of user feedback. Your feedback is important. Use the feedback form at the back of this book to send your comments to Lucent Technologies.

Safety Precautions

When performing maintenance or translation procedures on the system, users must observe certain precautions. Observe all caution, warning, and danger statements to prevent loss of service, possible equipment damage, and possible personal injury. In addition, the following precautions regarding electromagnetic interference (EMI) and static electricity must be observed:

Electromagnetic Interference

This equipment generates, uses, and can radiate radio frequency energy. Electromagnetic fields radiating from the switch may cause noise in the customer's equipment. If the equipment is not installed and used in accordance with the instruction book, radio interference may result.

WARNING:

To maintain the EMI integrity of the system, maintenance personnel must ensure that all cabinet panels, covers, and so forth, are firmly secured before leaving the customer's premises.

Static Electricity

To prevent or reduce electrostatic discharge (ESD), always attach wrist grounding straps before working on switch components or handling circuit packs.

CAUTION:

Electrostatic discharge can damage or destroy circuit packs containing integrated circuits (ICs).

The ESD wrist strap, cable assembly, and spare fuses are packed in a plastic bag and placed in the top of the system cabinet. Use the ESD wrist strap when troubleshooting, performing maintenance, or handling any circuit packs associated with the system.

Class 1 Laser Device

The DEFINITY ECS contains a Class 1 Laser device if single-mode fiber optic cable is connected to a remote Expansion Port Network (EPN). The LASER device operates within the following parameters:

Power Output: -5 dBm

Wavelength: 1310 nm

Mode Field Diameter: 8.8 microns

DANGER:

Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

Contact your Lucent Technologies representative for more information.

Security Issues

A number of matters concerning maintenance are affected by security issues. For details, be sure to consult the *GBCS Products Security Handbook*.

CAUTION:

Login security is an attribute of the DEFINITY® Enterprise Communications Server (ECS) Release 7 software.

Standards Compliance

The equipment presented in this document complies with the following (as appropriate):

- ITU-T (Formerly CCITT)
- ECMA
- ETSI
- IPNS
- DPNSS
- National ISDN-1
- National ISDN-2
- ISO-9000
- ANSI
- FCC Part 15 and Part 68
- EN55022
- EN50081
- EN50082
- CISPR22
- Australia AS3548 (AS/NZ3548)
- Australia AS3260
- IEC 825
- IEC950
- UL 1459
- UL1950
- CSA C222 Number 225
- TS001

Electromagnetic Compatibility Standards

This product complies with and conforms to the following:

- Limits and Methods of Measurements of Radio Interference Characteristics of Information Technology Equipment, EN55022 (CISPR22), 1993
- EN50082-1, European Generic Immunity Standard
- FCC Parts 15 and 68
- Australia AS3548

NOTE:

The system conforms to Class A (industrial) equipment. Voice terminals meet Class B requirements.

- Electrostatic Discharge (ESD) IEC 1000-4-2
- Radiated radio frequency field IEC 1000-4-3
- Electrical Fast Transient IEC 1000-4-4
- Lightning effects IEC 1000-4-5
- Conducted radio frequency IEC 1000-4-6
- Mains frequency magnetic field IEC 1000-4-8
- Low frequency mains disturbance

The system conforms to the following:

- Electromagnetic compatibility General Immunity Standard, part 1; residential, commercial, light industry, EN50082-1, CENELEC, 1991
- Issue 1 (1984) and Issue 2 (1992), Electrostatic discharge immunity requirements (EN55024, Part 2) IEC 1000-4-2
- Radiated radio frequency field immunity requirements IEC 1000-4-3
- Electrical fast transient/burst immunity requirements IEC 1000-4-4

European Union Standards

Lucent Technologies Business Communications Systems declares that the DEFINITY equipment specified in this document bearing the “CE” mark conforms to the European Union Electromagnetic Compatibility Directives.

The “CE” (Conformité Européenne) mark indicates conformance to the European Union Electromagnetic Compatibility Directive (89/336/EEC) Low Voltage Directive (73/23/EEC) and Telecommunication Terminal Equipment (TTE)

Directive (91/263/EEC) and with i-CTR3 Basic Rate Interface (BRI) and i-CTR4 Primary Rate Interface (PRI) as applicable.

The “CE” mark is applied to the following Release 7 products:

- Global AC powered Multi-Carrier Cabinet (MCC)
- DC powered Multi-Carrier Cabinet (MCC) with 25-Hz ring generator
- AC powered Single-Carrier Cabinet (SCC) with 25-Hz ring generator
- AC powered Compact Single-Carrier Cabinet (CSCC) with 25-Hz ring generator
- Enhanced DC Power System

Related Documents

The following books are useful for system-related information:

DEFINITY ECS Release 7.1 — Change Description, 555-233-405

Gives a high-level overview of what is new in DEFINITY ECS Release 7. Describes the hardware and software enhancements and lists the problem corrections for this release.

DEFINITY ECS Release 7— System Description Pocket Reference, 555-230-211

Provides hardware descriptions, system parameters, listing of hardware required to use features, system configurations, and environmental requirements.

DEFINITY ECS Release 7 — Administrator's Guide, 555-233-502

Provides descriptions of system features. Also provides step-by-step procedures for preparing the screens that are required to implement the features, functions, and services of the system. Includes the applications and benefits, feature interactions, administration requirements, hardware requirements, and procedures for voice terminal, data module, and trunk group administration.

DEFINITY ECS Release 7 — Reports, 555-230-511

Formerly titled *System Monitoring and Reporting*, this book provides detailed descriptions of the measurement, status, security, and recent change history reports available in the system and is intended for administrators who validate traffic reports and evaluate system performance. Includes corrective actions for potential problems.

DEFINITY ECS Release 7 — Installation and Test for Single-Carrier Cabinets, 555-230-894

Provides procedures and information for hardware installation and initial testing of single-carrier cabinets. This document is available in the following languages: English, German (DE), Dutch (NL), Brazilian Portuguese (PTB), European French (FR), Castillian Spanish (SP), Italian (IT), Russian (RU), and Japanese (JA). To order, append the language suffix to the document number; for example, 555-230-894DE for German. No suffix is needed for the English version.

DEFINITY ECS Release 7 — Upgrades and Additions for R7si, 555-233-104

Provides procedures and information for hardware installation, upgrades, and initial testing of compact single-carrier cabinets.

***DEFINITY ECS Release 7 — Installation and Test for Multi-Carrier Cabinets,
555-230-112***

Provides procedures and information for hardware installation and initial testing of multi-carrier cabinets.

DEFINITY ECS Release 7 — Maintenance for R7r, 555-230-126

Provides detailed descriptions of the procedures for monitoring, testing, troubleshooting, and maintaining the R7r ECS. Included are maintenance commands, step-by-step trouble-clearing procedures, the procedures for using all tests, and explanations of the system's error codes.

BCS Products Security Handbook, 555-025-600

Provides information about the risks of telecommunications fraud and measures for addressing those risks and preventing unauthorized use of BCS products. This document is intended for telecommunications managers, console operators, and security organizations within companies.

***DEFINITY ECS Release 7 — Installation for Adjuncts and Peripherals,
555-230-125***

Provides procedures and information for hardware installation and initial testing of ECS adjunct and peripheral systems and equipment.

DEFINITY Wireless Business System Users Guide, 555-232-105

***DEFINITY Wireless Business System Installation and Test Guide,
555-232-102***

DEFINITY Wireless Business Systems System Interface, 555-232-108

AT&T Network and Data Connectivity Reference, 555-025-201

Federal Communications Commission Statement

Part 68: Statement

Part 68: Answer-Supervision Signaling. Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 rules. This equipment returns answer-supervision signals to the public switched network when:

- Answered by the called station
- Answered by the attendant
- Routed to a recorded announcement that can be administered by the CPE user

This equipment returns answer-supervision signals on all DID calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered
- A busy tone is received
- A reorder tone is received

This equipment is capable of providing users access to interstate providers of operator services through the use of access codes. Modification of this equipment by call aggregators to block access dialing codes is a violation of the Telephone Operator Consumers Act of 1990.

This equipment complies with Part 68 of the FCC Rules. On the rear of this equipment is a label that contains, among other information, the FCC registration number and ringer equivalence number (REN) for this equipment. If requested, this information must be provided to the telephone company.

The REN is used to determine the quantity of devices which may be connected to the telephone line. Excessive RENs on the telephone line may result in devices not ringing in response to an incoming call. In most, but not all areas, the sum of RENs should not exceed 5.0. To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local telephone company.

NOTE:

REN is not required for some types of analog or digital facilities.

Means of Connection

Connection of this equipment to the telephone network is shown in the following table.

Manufacturer's Port Identifier	FIC Code	SOC/REN/ A.S. Code	Network Jacks
Off/On Premises Station	OL13C	9.0F	RJ2GX, RJ21X, RJ11C
DID Trunk	02RV2-T	0.0B	RJ2GX, RJ21X
CO Trunk	02GS2	0.3A	RJ21X
CO Trunk	02LS2	0.3A	RJ21X
Tie Trunk	TL31M	9.0F	RJ2GX
1.544 Digital Interface	04DU9-B,C	6.0P	RJ48C, RJ48M
1.544 Digital Interface	04DU9-BN,KN	6.0P	RJ48C, RJ48M
120A2 Channel Service Unit	04DU9-DN	6.0P	RJ48C

If the terminal equipment (DEFINITY® System) causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the telephone company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The telephone company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the telephone company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

If trouble is experienced with this equipment, for repair or warranty information, please contact the Technical Service Center at 1-800-248-1234. If the equipment is causing harm to the telephone network, the telephone company may request that you disconnect the equipment until the problem is resolved.

It is recommended that repairs be performed by Lucent Technologies certified technicians.

The equipment cannot be used on public coin phone service provided by the telephone company. Connection to party line service is subject to state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.

This equipment, if it uses a telephone receiver, is hearing aid compatible.

How to Order Documentation

In addition to this book, other description, installation and test, maintenance, and administration books are available. A complete list of DEFINITY books can be found in the *Business Communications System Publications Catalog*, 555-000-010.

This document and any other DEFINITY documentation can be ordered directly from the Lucent Technologies Business Communications System Publications Fulfillment Center toll free at 1-800-457-1235 (voice) and 1-800-457-1764 (fax). International customers should use 317-322-6791 (voice) and 317-322-6849 (fax).

How to Comment on This Document

Lucent Technologies welcomes your feedback. Please fill out the reader comment card found at the front of this manual and return it. Your comments are of great value and help improve our documentation.

If the reader comment card is missing, FAX your comments to 1-303-538-1741 or to your Lucent Technologies representative, and mention this document's name and number, *DEFINITY Enterprise Communication Server Release 7 Maintenance for R7si*, 555-233-105.

Maintenance Architecture

1

The maintenance subsystem is a part of the software that initializes and maintains the system. The software continuously monitors system health, and keeps a record of errors detected in the system. The maintenance subsystem also provides a user interface for on-demand testing.

This chapter provides a brief description of the maintenance strategy and the background information on the system's overall functions. For detailed descriptions of components and subsystems, refer to related topics in [Chapter 10, "Maintenance Object Repair Procedures"](#).

What's new for R7r

- ["Access Security Gateway \(ASG\)"](#)
- [ATM](#)
- ["Duplication"](#)
- ["IP Trunking"](#)
- ["Japan 2Mbit service \(TN2242\)"](#)
- ["Definity over LAN services"](#)

Access Security Gateway (ASG)

Access Security Gateway is *installed in the DEFINITY software base* and is a centralized access interface that uses a challenge/response protocol to verify the authenticity of a user and to reduce the opportunity for unauthorized access. Topics covered in this section are:

- ["Locking administered passwords"](#)

Locking administered passwords

Page 2 of the Change System-parameters Customer-options form contains a **ASG?** field with a default of **n**, as shown in the screen below. *Do not* change this field.

Do not change any of these fields to y.

ATM

The DEFINITY ECS can interface with an Asynchronous Transfer Mode (ATM) switch array to allow:

- Replacement of the G3r Center Stage Switch
- PNC-WAN
- Customers to merge voice and data networks
- Circuit Emulation Service (CES) or ATM trunking
- See ATM-EI and related Maintenance Objects

Duplication

Through the new TN792 DUPINT (Duplication Interface) circuit pack and the direct fiber connections on the front faceplate, the si switch can be duplicated (see DUPINT).

IP Trunking

The DEFINITY ECS interfaces through the new TN802 circuit pack to an Internet connection to provide Internet telephony services.

Japan 2Mbit service (TN2242)

The TN2242 2Mbit, 30-port trunk circuit pack supports Japanese TTC private networking environments. This circuit pack interfaces only with network equipment or other circuit packs of the same model and is incompatible with all other digital trunk circuit packs.

Definity over LAN services

The CLAN circuit pack (TN795) is the DEFINITY ECS interface to LAN services over which telephony can be distributed.

International Consolidation (I-CON)

The Location field defaults to 1 for the United States and Canada. The Location field must be set to 2 for all other locations to allow the use of International Consolidation circuit packs and terminals in all DEFINITY ECS platform and International offers.

Circuit Packs

TN791, TN 2793, TN2214 and TN2215 are new TN codes assigned to International Consolidation circuit packs that are exported outside of the United States and Canada. These circuit packs are functionally identical to those described in [Table 1-1](#).

The International Consolidation circuit packs function properly only in Offer Category A systems outside of the US and Canada or in Offer Category B (DEFINITY BCS or Guestworks) systems in the US and Canada.

If an International Consolidation circuit pack is inserted into a Category A system with the Location field set to 1, the circuit pack cannot operate properly, and the system generates a major alarm (Error Code 276).

Table 1-1. International Consolidation circuit packs

Standard - for use in the US and Canada (Offer A)	International Consolidation - For use in international offers and Offer B	Description
TN746B	TN791	16 port analog line
TN793	TN2793	24 port analog line
TN2224	TN2214	24 port digital line
	TN2215	16 port analog line (used only in Australia, China, and Western Europe)
TN464F	TN2464	DS1

How to use the Maintenance book

This procedure begins with the system raising an alarm against a Maintenance Object (MO), a software module that monitors the components of a circuit pack. These components can include:

- Hardware
- System (processor) availability and conditions
- Presence of and physical connections (copper, fiber) to other components
- Presence of certain signals (synchronization, DS1) within specific parameters
- Environment (power, cabinet temperature sensors)

Table 1-2. Alarm levels, reporting conditions and action to take

Alarm level	Description	Reported to INADS?	Reported to console?	What action to take?
MAJOR	Critical service degradation	Y	Yes, after 4 attempts to call INADS	Immediate attention
MINOR	Some service degradation but does not render the system inoperable.	Y	Same as above	Check to see what service is affected
WARNING	Failure that causes no significant service degradation	N ¹	N	Monitor the situation. May be service or equipment interruption or failure outside the switch.

1. Some system-downgraded Warning alarms are reported to INADS.

Alarms are further classified as:

- On-board problems originate in the circuitry on the alarmed circuit pack.
- Off-board problems originate in a process or component that is external to the circuit pack.

To clear system alarms using the appropriate maintenance book:

1. Type **display alarms** and press Enter.
2. A query screen displays next ([Screen 1-1](#)), asking you if you want to see all alarms or if you want to restrict the list to certain kinds of errors.

```

                                ALARM REPORT
The following options control which alarms will be displayed.
ALARM TYPES
      Active? y   Resolved? n
      Major? y   Minor? y   Warning? y
REPORT PERIOD
      Interval: m   From: / / :   To: / / :
EQUIPMENT TYPE ( Choose only one, if any, of the following )
      Cabinet:
      Port Network:
      Board Number:
      Port:
      Category:
    
```

Screen 1-1. Alarm Report query screen

a. The report can be restricted by typing either **y** (yes) or **n** (no) in these fields (shown above in bold):

- Active
- Major
- Minor
- Warning

CAUTION:

*If you choose **n** for major alarms and **y** for minor and warning alarms, you will not see the macro-level information that you may need to determine what is wrong with the system.*

b. The Cabinet, Port Network Board Number, Port and Category fields are described in the ["Field descriptions"](#) section.

3. After you have made your choices to tailor the report, press Enter.

4. The alarm log displays.

ALARM REPORT

Port	Maintenance On Name	Alt Brd? Name	Alarm Type	Svc State	Ack? 1 2	Date Alarmed	Date Resolved
01C1008	DID-TRK	y	MAJOR			03/09/00:30	00/00/00:00

Screen 1-2. Alarm Report screen

A DID trunk port in slot 10, carrier C has a MAJOR alarm.

5. Note the value in the `Port` field (01C1008). This is the alarmed port address.
6. Type **display errors** and press Enter.
7. A query screen displays next, asking if you want to see all the errors or if you want to restrict the list to certain kinds of errors. Except for warning levels (Major, Minor, Warning), the screen is the same as [Screen 1-1](#).

Generally, unless you suspect a problem occurred within a certain time frame or with a particular component of the system, simply pressing Enter at the query screen displays the accumulated system errors ([Screen 1-3](#)).

HARDWARE ERROR REPORT - ACTIVE ALARMS

Port	Mtce Name	Alt Name	Err Type	Aux Data	First Occur	Last Occur	Err Cnt	Err Rt	Rt/ Hr	Al St	Ac
01C1008	DID-TRK		1547		03/09/00:20	03/15/01:18	255	1	7	a	y

Screen 1-3. Hardware Error Report - Active Alarms

1 Maintenance Architecture

How to use the Maintenance book

1-8

8. Note the Error Type (Err Type field) value (1547) and the Aux Data value if present.
9. Find the DID-TRK MO in the Maintenance Object chapter of the appropriate maintenance book.
10. In the first table look up the initial command to run in the MAJOR row of the table (Step 4 indicated that a DID trunk in slot 10, carrier C has a MAJOR alarm).

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
DID-TRK	MAJOR ²	test port UUCSSpp long	DID Trunk
DID-TRK	MINOR	test port UUCSSpp long	DID Trunk
DID-TRK	WARNING	test port UUCSSpp	DID Trunk

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs), *C* is the carrier designation (A, B, C, D, or E), *SS* is the number of the slot in which the circuit pack resides (01 to 21), and *pp* is the two digit port number (01, 02, ...).
2. A MAJOR alarm on a trunk indicates that alarms on these trunks are downgraded by the set options command and that at least 75% of the trunks in this trunk group are alarmed.

11. Type **test port 01C1008 long** and press Enter.

“01C1008” is the address of the alarmed port (see [Screen 1-2](#) and [Screen 1-3](#))

12. While the port test is running, look up the Error Type (1537 from [Screen 1-3](#)) in the DID Trunk Error Log Entries table (example below).

Table 1-3. DID Trunk Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1537		Port Diagnostic (#35)	MAJ/MIN/WRN	OFF	test port UUCSSpp sh r 1
3840 (k)	40965	None			

13. Since the Test to Clear Value (**test port 01C1008 sh r 1**) is very similar to the initial test you ran in Step 11, wait for the results of the port test.

14. When the port test finishes, the following display appears ([Screen 1-4](#)):

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C1008	DID-TRK		35	FAIL	61472

Screen 1-4. Test Results screen

- Find the Port Diagnostic Test (#35) [from the Test No. field] in the DID-TRK section of the Maintenance book. Note the Error Code (61472).
- Look in [Table 1-4](#) for Test #35 and then find "61472" in the Error Code column and "FAIL" in the Test Result column read the Description/Recommendation column.

Table 1-4. TEST #35 Port Diagnostic Test

Error Code	Test Result	Description/Recommendation
61472	FAIL	Battery feed test failed. A problem with the incoming CO line was detected. <ol style="list-style-type: none"> Check the incoming CO line for proper operation. If warranted, refer the problem to the CO. If the CO line checks out Ok, the failure must be on the DID port. Replace the circuit pack.

- Perform both steps in the Description/Recommendation column.
- Test the port (**test port 01C1008 long** and press Enter.) again after all of the recommendations are exhausted.
- If all tests pass, wait approximately 3-5 minutes for the Alarm and Error logs to clear.
- Type display alarms and press Enter twice.
- Check that the DID-TRK alarm does not appear in the log.

Maintenance Objects

The system is partitioned into separate entities called Maintenance Objects (MOs). Each MO is referred to by an upper-case, mnemonic-like name that serves as an abbreviation for the MO. For example, "CO-TRK" stands for "Central Office TRUnK". Each MO is monitored by the system and has its own maintenance strategy. Most MOs are individual circuit packs. Some MOs are hardware components that reside on part of a circuit pack. For example, the TDM bus Clock circuits reside on the Tone/Clock circuit pack. Other MOs, such as cabinet environmental sensors, represent larger subsystems or sets of monitors. Finally, some MOs, such as SYNChronization, represent processes or a combination of processes and hardware.

"Maintenance names" are recorded in the error and alarm logs. Individual copies of an MO are assigned an address that defines the MO's physical location in the system. These locations display as the "PORT" field in the alarm and error logs

and as output of various commands such as **test board**, **busy tdm-bus**, and so forth.

Alarm and Error Reporting

During normal operations, software or firmware may detect error conditions relevant to specific MOs. The system attempts to fix or circumvent these problems automatically. However, if a hardware component incurs too many errors, an alarm is raised. Errors are detected in two ways:

- For “in-line” errors, firmware on the component detects the occurrence of an error during ongoing operations.
- For other types of errors, a “periodic test” or a “scheduled test” started by the software detects the error. The technician can run these tests on demand by using the maintenance commands described in [Chapter 8, “Maintenance Commands and Trouble-Clearing Aids”](#), and [Chapter 10, “Maintenance Object Repair Procedures”](#).

Software puts the error in the error log, and increments the error counter for that error. When an error counter is “active,” (greater than zero), there is a maintenance record for the MO.

Alarms are classified as MAJOR, MINOR, or WARNING, depending on the effect on system operation. They are also classified as ON-BOARD or OFF-BOARD.

- MAJOR alarms identify failures that cause a critical degradation of service. These alarms require immediate attention.
- MINOR alarms identify failures that cause some service degradation but that do not render a crucial portion of the system inoperable. MINOR alarms require attention. However, typically a MINOR alarm affects only a few trunks or stations or a single feature.
- WARNING alarms identify failures that cause no significant degradation of service or equipment failures external to the switch. These failures are not reported to INADS or to the attendant console.
- ON-BOARD problems originate in the circuitry on the alarmed circuit pack.
- OFF-BOARD problems originate in a process or component that is external to the circuit pack.

Alarms are discussed further in [Chapter 10, “Maintenance Object Repair Procedures”](#).

Maintenance Testing

Most troubles are reduced to the circuit pack level and can be identified by LEDs on the circuit packs and software reports generated by the system. The maintenance tests in the system are divided into three groups:

- Periodic

Background tests are performed by software maintenance, usually on an hourly basis. These tests are nondestructive and can be run during high traffic periods without interfering with calls.

- Scheduled

Background tests performed by software maintenance, usually on a daily basis, are generally more thorough than periodic testing. The tests are considered destructive and are run only during off-hours so as not to interfere with calls.

- Fixed interval

Background tests performed by software maintenance at regular time intervals (these intervals cannot be administered). These tests run concurrently with periodic maintenance. The following table lists the MOs that run fixed interval testing.

Maintenance Object	Interval (minutes)
POWER	60
SPE-SELEC	60
STBY-SPE	120
TDM-BUS	10
TONE-PT	10

Demand tests are also run by the system when it detects a need or by maintenance personnel in trouble-clearing activities. Demand tests include periodic tests plus other tests required only when trouble occurs. Some nonperiodic demand tests may disrupt system operation. In this book, destructive (service-disrupting) tests are identified in boldface type.

Maintenance personnel can use the management terminal to initiate the same tests that the system initiates. The terminal screen displays the test results.

Protocols

This section describes the protocols handled by the system and the points where these protocols change. [Figure 1-3](#) is a pictorial guide through data-transmission state changes. [Figure 1-3](#) illustrates the flow of data from DTE

equipment, like a terminal or host, through DCE equipment, like a modem or data module, into a communications port on the system. The data flow is shown by solid lines. Below these lines are the protocols used at particular points in the data stream.

Not shown in the [Figure 1-3](#) is the treatment of D-channels in ISDN-PRI and ISDN-BRI transmissions. PRI and BRI D-channels transport information elements that contain call-signaling and caller information. These elements conform to ISDN level-3 protocol. In the case of BRI, the elements are created by the terminal or data module; for the PRI, the elements are created by the system, which inserts them into the D-channel at the DS1 port.

For ISDN transmissions, therefore, BRI terminals and data modules, and DS1 ports insert, interpret, and strip both layer-2 DCE information and layer-3 elements. Also, the DS1 port passes layer-3 elements to the system for processing.

Layers

The Open System Interconnect (OSI) model for data communications contains seven layers, each with a specific function. Communications to and through the system concern themselves only with layers 1 and 2 of the model.

Layer 1, or the *physical layer*, covers the physical interface between devices and the rules by which bits are passed. Among the physical layer protocols are RS-232, RS-449, X.21, DCP, DS1, and others.

Layer 2, or the *data-link layer*, refers to code created and interpreted by the DCE. The originating equipment can send blocks of data with the necessary codes for synchronization, error control, or flow control. With these codes, the destination equipment checks the physical-link reliability, corrects any transmission errors, and maintains the link. When a transmission reaches the destination equipment, it strips any layer-2 information the originating equipment may have inserted. The destination equipment only passes to the destination DTE equipment the information sent by the originating DTE equipment. The originating DTE equipment can also add layer-2 code to be analyzed by the destination DTE equipment. The DCE equipment treats this layer as data and passes it along to the destination DTE equipment as it would any other binary bits.

Layers 3 to 7 (and the DTE-created layer 2) are embedded in the transmission stream and are meaningful only at the destination DTE equipment. Therefore, they are shown in the figure as "user-defined," with no state changes until the transmission stream reaches its destination.

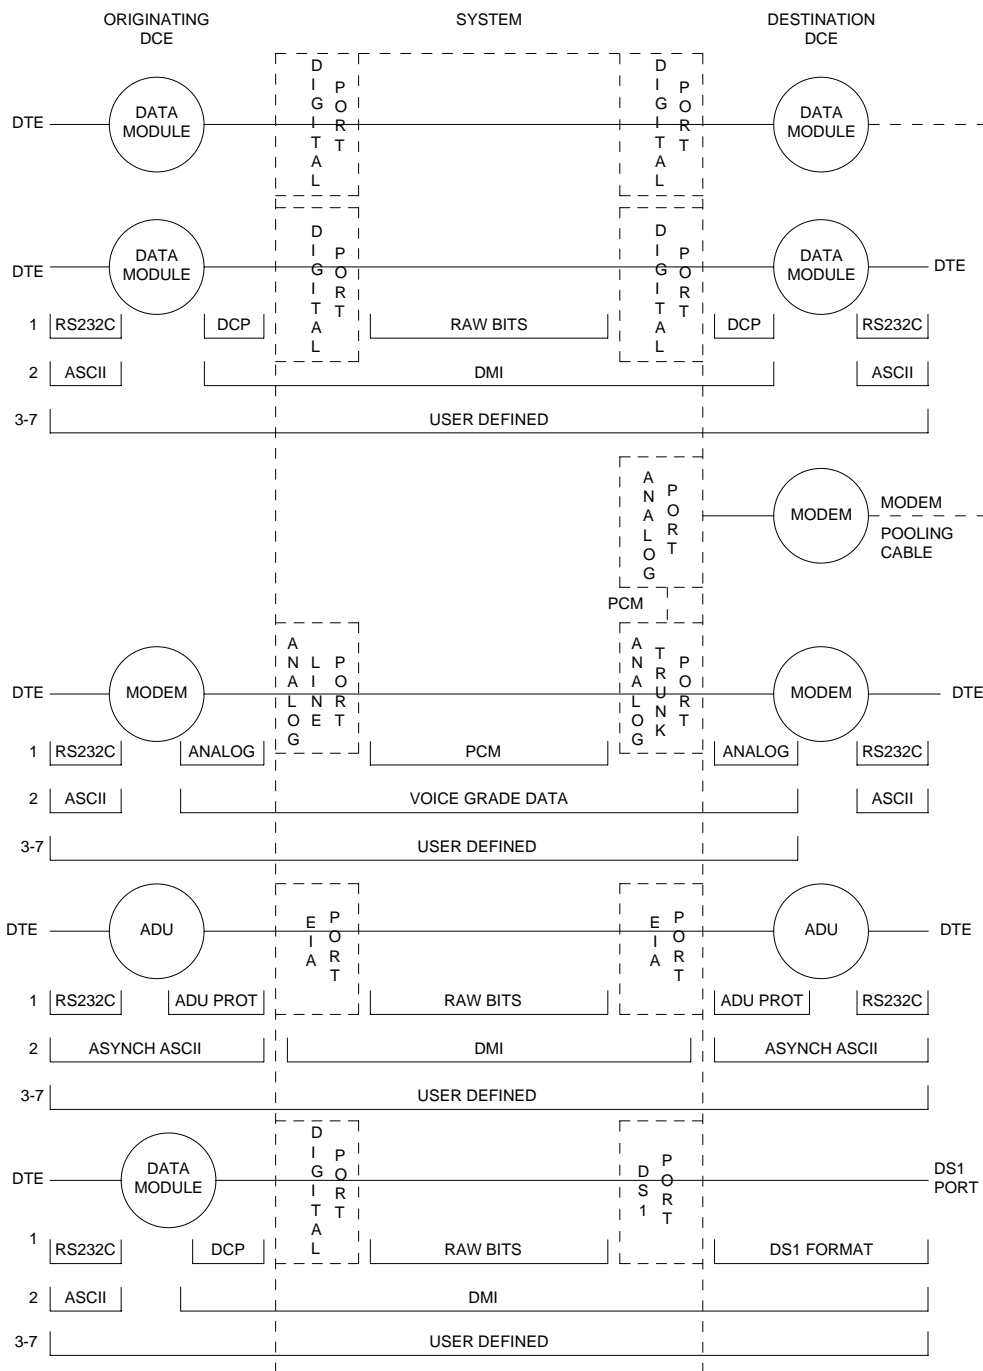

Figure 1-3. Data Transmission States

Usage

The following is a list of the protocols when data is transmitted to and through the system. The list is organized by protocol layers. Refer to [Figure 1-3](#).

Layer-1 Protocols

Layer-1 protocols are used between the terminal or host DTE and the DCE, used between the DCE equipment and the system port, and used inside the system.

The following layer-1 protocols are used between the DTE equipment and the DCE equipment. DCE equipment can be data modules, modems, or Data Service Units (DSUs). A DSU is a device that transmits digital data to a particular digital endpoint over the public network without processing the data through any intervening private network switches.

- **RS-232** — A common physical interface used to connect DTE to DCE. This protocol is typically used for communicating up to 19.2 kbps
- **RS-449** — Designed to overcome the RS-232 distance and speed restrictions and lack of modem control
- **V.35** — A physical interface used to connect DTE to a DCE. This protocol is typically used for transmissions at 56 or 64 kbps

The following protocols are used at layer 1 to govern communication between the DCE equipment and the port. These protocols consist of codes inserted at the originating DCE and stripped at the port. The DS1 protocol can be inserted at the originating, outgoing trunk port and stripped at the destination port.

- **Digital Communications Protocol (DCP)** — A standard for a 3-channel link. This protocol sends digitized voice and digital data in frames at 160 kbps. The channel structure consists of two information (I) channels and one signaling (S) channel. Each I-channel provides 64 kbps of voice and/or data communication and the S-channel provides 8 kbps of signaling communication between the system and DTE equipment. DCP is similar to ISDN-BRI
- **Basic Rate Interface (BRI)** — An ISDN standard for a 3-channel link, consisting of two 64-kbps bearer (B) channels and one 16-kbps signaling (D) channel. For the implementation of this standard, see *DEFINITY Communications System and System 75 and System 85 ISDN BRI Reference*, 555-025-103
- **Primary Rate Interface (PRI)** — An ISDN standard that sends digitized voice and digital data in T1 frames at 1.544-Mbps or, for countries outside the United States, in E1 frames at 2.048-Mbps. Layer 1 (physical), layer 2 (link), and layer 3 (network) ISDN PRI protocols are defined in *AT&T System 75 and 85 — DS1/DMI/ISDN-PRI — Reference Manual*, 555-025-101. At 1.544 Mbps, each frame consists of 24 64-kbps channels plus 8 kbps for framing. This represents 23 B-channels plus 1 D-channel.

The maximum user rate is 64 kbps for voice and data. The maximum distances are based on T1 limitations. At 2.048 Mbps, each E1 frame consists of 32 64-kbps channels

- *Analog* — A modulated voice-frequency carrier signal
- *ADU Proprietary* — A signal generated by an ADU. The signal is for communication over limited distances and can be understood only by a destination ADU or destination system port with a built-in ADU
- *Digital Signal Level 1 (DS1)* — A protocol defining the line coding, signaling, and framing used on a 24-channel line. Many types of trunk protocols (for example, PRI and 24th-channel signaling) use DS1 protocol at layer 1
- *European Conference of Postal and Telecommunications rate 1 (CEPT1)* — A protocol defining the line coding, signaling, and framing used on a 32-channel line. Countries outside the United States use CEPT1 protocol

Inside the system, data transmission appears in one of two forms:

1. Raw digital data, where the physical layer protocols, like DCP, are stripped at the incoming port and reinserted at the outgoing port.
2. Pulse Code Modulation (PCM)-encoded analog signals (analog transmission by a modem), the signal having been digitized by an analog-to-digital coder/decoder (CODEC) at the incoming port.

Layer-2 Protocols

Layer-2 protocols are given below:

- *8-bit character code* — Between the DTE equipment and the DCE equipment. Depending on the type of equipment used, the code can be any proprietary code set.
- *Digital multiplexed interface proprietary* — Family of protocols between the originating DCE and the destination DCE for digital transmission. See *DEFINITY Communications System and System 75 and System 85 DS1/DMI/ISDN PRI Reference*, 555-025-101; and *Digital Multiplexed Interface [DMI] Technical Specification*, 555-025-204
- *Voice-grade data* — Between the originating DCE and the destination DCE for analog transmission

Protocol States

[Table 1-5](#) summarizes the protocols used at various points in the data transmission stream. See [Figure 1-3](#).

Table 1-5. Protocol States for Data Communication

Transmission Type	Incoming DTE to DCE	OSI Layer	Protocols DTE to DCE	DCE to System Port	Inside System
Analog	Modem	1	RS-232, RS-449, or V.35	analog	PCM
		2	8- or 10-bit code	voice-grade data	voice-grade data
	ADU	1	RS-232	ADU proprietary	raw bits
		2	asynchronous 8-bit code	asynchronous 8-bit code	DMI
Digital	Data Module	1	RS-232, RS-449, or V.35	DCP or BRI	raw bits
		2	8-bit code	DMI	DMI
	Digital Signal Level 1 (DS1)	1	any	DS1	PCM or raw bits
		2	8-bit code	DMI or voice-grade data	DMI or voice-grade data

NOTE:

OSI means Open Systems Interconnect
 PCM means Pulse Code Modulated
 DMI means Digital Multiplexed Interface

Both the physical-layer protocol and the Digital Multiplexed Interface (DMI) mode used in the connection are dependent upon the type of 8-bit code used at layer 2 between the DTE equipment and DCE equipment, as listed in [Table 1-6](#) and [Table 1-7](#).

Table 1-6. Physical-Layer Protocol Versus Character Code

Protocol	Code
RS-232	Asynchronous 8-bit ASCII, and synchronous
RS-449	Asynchronous 8-bit ASCII, and synchronous
V.35	Synchronous

Table 1-7. Digital Multiplexed Interface (DMI) Mode Versus Character Code

DMI Mode	Code
0	Synchronous (64 kbps)
1	Synchronous (56 kbps)
2	Asynchronous 8-bit ASCII (up to 19.2 kbps), and synchronous
3	Asynchronous 8-bit ASCII, and private proprietary

Connectivity Rules

[Figure 1-3](#) implies the following connectivity rules:

- Only the DS1 port and the analog trunk port are trunking facilities (all other ports are line ports). For communication over these facilities, the destination DCE equipment can be a hemisphere away from the system, and the signal can traverse any number of intervening switching systems before reaching the destination equipment.
- Data originating at any type of digital device, whether DCP or BRI, can exit the system at any type of digital port — BRI, digital-line, PRI, DS1, and others; as long as the call destination is equipped with a data module using the same DMI mode used at the call origin. This is because once the data enters the system through a digital port, its representation is uniform (raw bits at layer 1, and DMI at level 2), regardless of where it originated.
- Although data entering the system through an EIA port has not been processed through a data module, the port itself has a built-in data module. Inside the system, port data is identical to digital line data. Data entering the system at a DCP line port can exit at an EIA port. Conversely, data entering the system at an EIA port can exit at any DCP line port. The destination data module must be set for Mode-2 DMI communication.
- Voice-grade data can be carried over a DS1 facility as long as the destination equipment is a modem compatible with the originating modem
- If a mismatch exists between the types of signals used by the endpoints in a connection (for example, the equipment at one end is an analog modem, and the equipment at the other end is a digital data module), a modem-pool member must be inserted in the circuit. When the endpoints are on different switches, it is recommended that the modem-pool member be put on the origination or destination system. A modem-pool

member is always inserted automatically for calls to off-premises sites via analog or voice-grade trunking. For internal calls, however, the systems are capable of automatically inserting a modem-pool member.

- Data cannot be carried over analog facilities unless inside the system it is represented as a Pulse Code Modulation (PCM)-encoded analog signal. To do this for data originating at a digital terminal, the signal enters the system at a digital port and exits the system at a digital port. The signal then reenters the system through a modem-pool connection (data-module to modem to analog-port) and exits the system again at an analog port.
- Although DS1 is commonly called a trunk speed, here it names the protocol used at layer 1 for digital trunks. Some trunks use different signaling methods but use DS1 protocol at layer 1 (for example, PRI and 24th-channel signaling trunks).

Disconnect Supervision

Disconnect supervision means the CO has the ability to release a trunk when the party at the CO disconnects, and the system is able to recognize the release signal. In general, a CO in the United States provides disconnect supervision for incoming calls but not for outgoing calls. Many other countries do not provide disconnect supervision on either incoming or outgoing calls.

The system must provide the assurance that at least one party on the call can control the dropping of the call. This avoids locking up circuits on a call where no party is able to send a disconnect signal to the system. Internal operations must check to be sure one party can provide disconnect supervision. An incoming trunk that does not provide disconnect supervision is not allowed to terminate to an outgoing trunk that does not provide disconnect supervision.

In a DCS environment, an incoming trunk without disconnect supervision can terminate to an outgoing DCS trunk connecting two nodes. The incoming trunk is restricted from being transferred to a party without disconnect supervision on the terminating node.

This is because, through messaging, the terminating node knows the originating node cannot provide disconnect supervision. This messaging is not possible with non-DCS tie trunks, and the direct call is denied.

Some two-wire loop start trunks outside the United States provide busy tone disconnect in place of line signals. For these trunks, an adjunct can be attached to the trunk to listen for busy or other disconnect tone. When a tone is detected, the adjunct sends line signals for disconnect to the system.

Administration is provided for each trunk group to indicate whether it provides disconnect supervision for incoming calls and for outgoing calls.

Transfer on Ringing

A station or attendant may conference in a ringing station or transfer a party to a ringing station. When a station conferences in a ringing station and then drops the call, the ringing station is treated like a party without disconnect supervision. However, when a station transfers a party to a ringing station, the ringing station party is treated like a party with disconnect supervision. Two timers (Attendant Return Call Timer and Wait Answer Supervision Timer) are provided to ensure the call is not locked to a ringing station.

Conference, Transfer, and Call-Forwarding Denial

If a station or attendant attempts to connect parties without disconnect supervision together, the following is possible:

- *Digital Station or Local Attendant Transfer:* if a digital station attempts to transfer the two parties together, the call appearance lamp flutters, indicating a denial. If transferring to a DCS trunk, the denial may drop the call since the transfer is allowed and the other system is queried for disconnect supervision.
- *Analog Station Transfer:* if an analog station attempts to transfer two parties together by going on-hook, the analog station is no longer on the call and the transfer cannot be denied.
- *Centralized Attendant Service (CAS) Attendant Transfer:* if a CAS attempts to transfer two parties together by pressing the release key, the release link trunk is released and the branch attempts a transfer by going on-hook
- *Station Conference/Dropout:* if a station conferences all parties, the conference is allowed since the station has disconnect supervision. When the station is dropped from the call, the call is dropped since the other parties do not have disconnect supervision.
- *Station Call Forwarding:* if a station is call forwarded off-premise to a trunk without disconnect supervision, the calling party without disconnect supervision is routed to the attendant

[Table 1-8](#) lists the various protocols, with applications and maximum limitations.

Table 1-8. Protocols Used in DEFINITY

Protocol	Applications	Maximum Data Rate	Maximum Distance
DCP	Digital switch to data endpoints	64 kbps	5000 feet (1524 m) for data 3000 feet (915 m) for voice
RS-232	System to administration terminal. Data module to host computer	19.2 kbps	50 feet (15.2 m)
	Data module to printer	64 kbps	17 feet (5.9 m)
	Data module for downloading and high-speed data transfer	64 kbps	17 feet (5.9 m)
	EIA interface (Data line to ADU)	19.2 kbps	2000 feet (610 m)
		9.6 kbps	5000 feet (1524 m)
4.8 kbps		7000 feet (2130 m)	
2.4 kbps		12,000 feet (3654 m)	
1.2 kbps		20,000 feet (6100 m)	
0.3 kbps	40,000 feet (12200 m)		
RS-449	Processor Interface to Processor Interface	19.2 kbps	200 feet (61 m)
		9.6 kbps	400 feet (122 m)
		4.8 kbps	800 feet (244 m)
		2.4 kbps	1600 feet (488 m)
SSI	715 BCS-2 to Processor Interface 500 series printers to Processor Interface	56 kbps	5000 feet (1524 m)
BISYNC	Processor Interface line controller to host computer for terminal emulation (9.6 kbps)	2.4 kbps 4.8 kbps 9.6 kbps	
BX.25	Communication interface to MSA, DCS, ISDN, or AUDIX	9.6 kbps	
SDCPI	Data module to Processor Interface	64 kbps	17 feet (5.9 m)
RS-366	Host computer to ACU		50 feet (15.2 m)
	Data module to ACU	64 kbps	17 feet (5.9 m)
V.35	Data module to data endpoints	56 kbps	50 feet (15.2 m)

Continued on next page

Table 1-8. Protocols Used in DEFINITY — Continued

Protocol	Applications	Maximum Data Rate	Maximum Distance
Category A	Data modules to terminals or cluster controller	64 kbps	500 feet (152 m)
	Data module in ASCII emulation mode	9.6 kbps	
ISDN-BRI	Communication interface to ISDN-BRI S/T	64 kbps	655 feet (199.3 m) to network interface or repeater 1310 feet (399.3 m) system to system
	ISDN-BRI U	160 kbps	18,000 feet (5486.4 m) from system to network interface, and then ~2000 feet to phone
ISDN-PRI	Communication interface to ISDN-PRI	64 kbps	655 feet (199.3 m) to network interface or repeater 1310 feet (399.3 m) system to system

NOTE:

ADU means Asynchronous Data Unit
 BCS means Business Communications System
 MSA means Message Servicing Adjunct
 ACU means Automatic Call Unit

Transmission Characteristics

The system transmission characteristics comply with the American National Standards Institute/Electronic Industries Association (ANSI/EIA) standard RS-464A (SP-1378A). The following tables list some general switch transmission characteristics.

Frequency Response

[Table 1-9](#) lists the analog-to-analog frequency response for station-to-station or station-to-CO trunk, relative to loss at 1 kHz for the United States.

Table 1-9. Analog-to-Analog Frequency Response

Frequency (Hz)	Maximum Loss (dB)	Minimum Loss (dB)
60	—	20
200	5	0
300 to 3000	1	-0.5
3200	1.5	-0.5
3400	3	0

[Table 1-10](#) lists the analog-to-digital frequency response of the system for station or CO-trunk-to-digital interface (DS0), relative to loss at 1 kHz for the United States.

Table 1-10. Analog-to-Digital Frequency Response

Frequency (Hz)	Maximum Loss (dB)	Minimum Loss (dB)
60	—	20
200	3	0
300 to 3000	0.5	-0.25
3200	0.75	-0.25
3400	1.5	0

Insertion Loss for Port-to-Port; Analog or Digital

[Table 1-11](#) lists the insertion loss in the system for different connection types for the United States. [Table 1-12](#) shows the overload and cross-talk characteristics.

Table 1-11. Insertion Loss for the United States

Typical Connections	Nominal Loss (dB) at 1 kHz
On-premises to on-premises station	6
On-premises to off-premises station	3
Off-premises to off-premises station	0
On-premises station to 4-wire trunk	3
Off-premises station to 4-wire trunk	2
Station-to-trunk	0
Trunk-to-trunk	0

Table 1-12. Overload and Crosstalk

Overload level	+3 dBm0
Crosstalk loss	>70 dB

Intermodulation Distortion

[Table 1-13](#) lists the intermodulation distortion in the system for analog-to-analog and analog-to-digital, up to 9.6 kbps data

Table 1-13. Intermodulation Distortion

Four-Tone Method	Distortion
Second-order tone products	>46 dB
Third-order tone products	>56 dB

Quantization Distortion Loss

[Table 1-14](#) lists the quantization distortion loss in the system for analog port to analog port.

Table 1-14. Quantization Distortion Loss

Analog Port-to-Analog Port	
Signal Level	Distortion Loss
0 to -30 dBm0	>33 dB
-40 dBm0	>27 dB
-45 dBm0	>22 dB

[Table 1-15](#) lists the quantization distortion loss in the system for analog port to digital port and digital port to analog port.

Table 1-15. Quantization Distortion Loss

Analog Port-to-Digital Port or Digital Port-to-Analog Port	
Signal Level	Distortion Loss
0 to -30 dBm0	>35 dB
-40 dBm0	>29 dB
-45 dBm0	>25 dB

Terminating Impedance: 600 Ohms nominal

Trunk balance impedance (selectable): 600 Ohms nominal or complex Z [350 Ohms + (1 k Ohms in parallel with 0.215uF)]

Impulse Noise

On 95% or more of all connections, the impulse noise is 0 count (hits) in five minutes at +55 dBmC (decibels above reference noise with C-filter) during the busy hour.

ERL and SFRL Talking State

Echo-Return Loss (ERL) and Single-Frequency Return Loss (SFRL) performance is usually dominated by termination and/or loop input impedances. The system provides an acceptable level of echo performance if the ERL and SFRL are met.

Station-to-station	ERL should meet or exceed 18 dB SFRL should meet or exceed 12 dB
Station to 4-wire trunk connection	ERL should meet or exceed 24 dB SFRL should meet or exceed 14 dB
Station to 2-wire trunk connection	ERL should meet or exceed 18 dB SFRL should meet or exceed 12 dB
4-wire to 4-wire trunk connection	ERL should meet or exceed 27 dB SFRL should meet or exceed 20 dB

Peak Noise Level

Analog to analog — 20 dBrnC (decibels above reference noise with C-filter)

Analog to digital — 19 dBrnC

Digital to analog — 13 dBrnC

Echo Path Delay

Analog port to analog port — ≤ 3 ms

Digital interface port to digital interface port — ≤ 2 ms

Service Codes

Service codes (for the United States only) are issued by the Federal Communications Commission (FCC) to equipment manufacturers and registrants. These codes denote the type of registered terminal equipment and the protective characteristics of the premises wiring of the terminal equipment ports.

Private line service codes are as follows:

- 7.0Y — Totally protected private communications (microwave) systems
- 7.0Z — Partially protected private communications (microwave) systems
- 8.0X — Port for ancillary equipment
- 9.0F — Fully protected terminal equipment

1 Maintenance Architecture
Facility Interface Codes

1-27

- 9.0P — Partially protected terminal equipment
- 9.0N — Unprotected terminal equipment
- 9.0Y — Totally protected terminal equipment

The product line service code is 9.0F indicating it is terminal equipment with fully protected premises wire at the private line ports.

Facility Interface Codes

A Facility Interface Code (FIC) is a five-character code (United States only) that provides the technical information needed to order a specific port circuit pack for analog private lines, digital lines, MTS lines, and WATS lines.

[Table 1-16](#) through [Table 1-18](#) list the FICs. Included are service order codes, Ringer Equivalency Numbers (RENs), and types of network jacks that connect a line to a rear panel connector on a carrier.

Table 1-16. Analog Private Line and Trunk Port Circuit Packs

Circuit Pack	FIC	Service Order Code	Network Jack
TN742 and TN747B Off-Premises Station Port, and TN746B Off-Premises Station Port or On-Premises Station port	0L13C	9.0F	RJ21X
TN760/B/C/D Tie Trunk	TL31M	9.0F	RJ2GX

Table 1-17. Digital Trunk Port Circuit Packs

Circuit Pack	FIC	Service Order Code	Network Jack
TN1654 and TN574 DS1 Converter; TN722B DS1 Tie trunk; and TN767 and TN464 DS1 Interface	04DU9B,C	6.0P	RJ48C and RJ48M

Table 1-18. MTS and WATS Port Circuit Packs

Circuit Pack	FIC	Ringer Equivalency Number (REN)	Network Jack
TN742 and TN746B Analog Line	02LS2	None	RJ21 and RJ11C
TN747B Central Office Trunk	02GS2	1.0A	RJ21X
TN753 DID Trunk	02RV2-T	0,0B	RJ21X
TN790 Processor	02LS2	1.0A	RJ21X
TN1648 System Access and Maintenance	02LS2	0.5A	RJ21X

Multimedia Interface (MMI)

The Multimedia Interface handles the following protocols:

- International Telecommunications Union (ITU) H.221 — Includes H.230, H.242, H.231, and H.243 protocol
- American National Standards Institute (ANSI) H.221 — Includes H.230, H.242, H.231, and H.243 protocol
- BONDING (Bandwidth On Demand INoperability Group) Mode 1
- ESM HLP HDLC Rate Adaptation

The Vistium Personal Conferencing System is supported either through the 8510T BRI terminal or directly through the Vistium TMBRI PC board.

Using the World Class Core (WCC) BRI interface, most desktop multimedia applications are supported through the Personal Computer's BRI interface.

Circuit Packs and Power

2

This chapter discusses the hardware configurations contained within and supported by the DEFINITY Systems. Where appropriate, detailed information down to the circuit pack level is provided. This chapter also discusses the power sources required to enable the various components within the system.

Circuit Packs

The following table lists all circuit packs supported by DEFINITY systems. For information concerning vintages and current versions, see *Reference Guide for Circuit Pack Vintages and Change Notices* which is published periodically as a special edition of the *AT&T Technical Monthly*.

[Table 2-1](#) lists circuit packs by Apparatus Code, Name, and Type. See the *Reference Guide for Circuit Pack Vintages and Change Notices* for circuit packs that pertain to your system.

WP-91153	AC Power Supply (Single-Carrier Cabinet)	Power

Power

There are two basic powering options available with the si system. These options include AC and DC. The cabinets and their associated power supplies can be powered by 120/208 volts AC either directly or from a Universal Power Supply (UPS) system. Alternatively, the cabinets and their power supplies may be powered by -48 volts DC from a battery power plant.

The vs system requires between 80 and 264 or between 90 and 132 volts AC. The system can be powered directly or from the WP-90510 power supply. The DC power option is not available with this system.

Except for the vs system, each control cabinet in an AC-powered system has an internal battery that provides a short term holdover to protect the system against short power interruptions. This method is known as the Nominal Power Holdover Strategy. The battery is connected so that it automatically provides power if the AC service fails. The time and extent of the holdover varies according to the type of cabinet and to whether or not the system has a duplicated control complex.

[Table 2-2](#) summarizes the response to the interruption of power service in systems without an internal holdover battery.

Table 2-2. Response to Power Service Interruption (without Internal Holdover Battery)

Cabinet Power Interruption	Less Than Power Supply Decay	Greater Than Power Supply Decay
-48 volt DC external power or multicarrier cabinet with UPS, no internal battery.	None on system, some impact on 48-volt powered circuits.	All calls dropped, system reloads.

The next two tables indicate various responses to the interruption of power service in DEFINITY Systems equipped with an internal holdover battery.

[Table 2-3](#) provides a summary of holdover times. [Table 2-4](#) indicates the types of cabinet power interruption based on power holdover durations.

Table 2-3. Response to Power Service Interruption with an Internal Holdover Battery

System and Configuration	Cabinet	Holdover for Entire Cabinet (in seconds)	Holdover for Entire Control Carrier (in minutes)
Standard	PPNMCC	10	10
High, Critical	PPNMCC	10	5
Standard/High, Critical	PPN SCC/ESCC	1/4	2
Standard/High, Critical ¹	EPN MCC	15	none
Standard/High, Critical	EPN SCC/ESCC	1/4	none

¹ The holdover times listed are in effect if the EPN contains a TN775 maintenance circuit pack. However, if the EPN contains a TN775B maintenance circuit pack, the holdover time for the entire cabinet is 10 seconds, and the holdover time for the control carrier is 10 minutes.

Table 2-4. Types of Cabinet Power Interruption

System and Cabinet	Shorter Holdover Than Entire Cabinet	Longer Holdover than Entire Cabinet, Shorter Holdover than Control Carrier	Longer Holdover Than Control Carrier
PPN SCC	No calls dropped	All calls dropped	System reloads
EPN SCC	No calls dropped	All calls dropped	System reloads

NOTE:

When EPN power is interrupted for greater than the cabinet holdover but less than the control carrier holdover, calls in the control carrier are held for the duration of the interruption but are dropped when power is restored.

Single-Carrier Cabinets

In single-carrier cabinets, there is no internal AC wiring or distribution and no software interaction with the power system. The power supplies themselves take about 250 milliseconds for the voltages to drop below limits.

The control cabinet that houses the Switch Processing Element (SPE) is the only cabinet that has an internal battery reserve. All other control cabinets and port cabinets have the 250 millisecond power supply decay delay, after which all connections and links associated with the cabinets are dropped.

The SPE control cabinet has a battery that furnishes power to the processor memory complex for a minimum of two minutes if the battery is fully charged. This battery is recharged after power is restored, but the charging process is not monitored by the system. The cabinet is not able to detect AC power loss, and it notices only a DC power output failure as the power supply output decays.

The memory contents are preserved, and the processor continues operating during the two minute period. However, the tone-clock circuit pack is not held over, and as a result, no connections are possible. The battery does not supply all the voltages necessary for the internal modem circuit on the processor circuit pack. As a result, no call is originated to INADS, and the switch cannot answer any calls. Thus, the switch cannot report any internal or external alarms during this period. After two minutes (depending on the condition of the battery), the processor and memory are lost, and the system is totally inactive.

If power is restored in less than 250 milliseconds, no calls are dropped. If power is restored between 250 milliseconds and two minutes, all calls are dropped, and memory is maintained. However, since the tone-clock was lost, the system undergoes a reset once the AC restoral process clears all calls and the alarm log (in which errors are retained). The switch keeps a record of the restart in the error log, but it might not detect a power error if the outage is between 1/4 of a second and one minute, during which time only a loss of clock and not a loss of the power failure that caused the loss of clock is logged. After one minute, a power error is logged. If the outage exceeds the battery holdover interval, the error logs and alarm logs are lost (since they cannot be saved to tape). Depending on the size of the system, it can take up to one minute to restore service to the ports. After a power outage of two minutes following the restoral of AC power, the system re-initializes from the tape. It takes about 10 minutes to restore service. Again, if the customer has frequent power outages or critical service needs, an external UPS or DC power system should be considered.

 **NOTE:**

For more power control information, refer to AC-POWER, DC-POWER, and POWER maintenance objects.

Management Terminals

3

General

Maintenance personnel can use the management terminal to initiate the same tests that the system initiates. Test results display on the terminal screen. This chapter illustrates these terminals, explains how to use them, and identifies the typical maintenance tasks that can be performed from them.

Management Terminals

The maintenance interface for the system technician is the management terminal. These terminals may be referred to as an *administration terminal*.

The following terminals are supported as administration terminals:

- 715 BCS
- 2900/715 BCS
- 715 BCS-2

In a standard reliability system, the terminal connects to the Processor circuit pack. In the PPN of a high or critical reliability system, the administration terminal connects to the Duplication Interface circuit pack in the PPN. In the EPN of a standard reliability system or of a high or critical reliability system, the administration terminal connects to the Maintenance circuit pack in the EPN.

Duplication Interface circuit pack A controls and monitors the same environment leads as the Maintenance/Tape Processor in a PPN system without high or critical reliability. Duplication Interface circuit pack A also supports the serial channel to the terminal in a PPN for a high or critical reliability system. The terminal connects to Duplication Interface circuit pack A via a connector, labeled **DOT** (Duplication

Option Terminal), on the back of cabinet A. At any time, the terminal may be disconnected from the Duplication Interface circuit pack A and connected directly to the active processor circuit pack by attaching the terminal to the connector labeled **TERM**. This connection should be made only if the terminal fails to function, since a problem with the Duplication Interface circuit pack A may be present.

Typical tasks that can be performed at the terminal are shown below.

- Display Error and Alarm logs
- Test circuit packs
- Test system functions
- Busyout and release system equipment
- Reset the system
- Monitor the system
- Check status of maintenance objects
- Check system translations

Most maintenance functions performed at the local administration terminal can also be done remotely at the INADS (Initialization and Administration System).

Terminal Keyboard

The keyboard is equipped with cursor keys, editing keys, and transaction keys. The three types of keys are described here.

Cursor Keys: Cursor keys are used to move the cursor between fields and pages on a screen form. The cursor must be positioned on a field before the user can add or change information in that field.

Editing Keys: Two editing keys, BACKSPACE and Clear, are provided. BACKSPACE is used to erase the character at the current cursor position. The cursor moves one position to the left each time the key is pressed. If the cursor is at the first position of the data entry field, it erases the character at the first position. Clear when pressed simultaneously with the Shift is used to clear all data in a field on a screen form. The cursor must be positioned at the field the user wants to clear before Clear is pressed.

Transaction Keys: Three transaction keys, Cancel, Enter, and Help, are provided. CANCEL is used to erase a form or command. Once the key is pressed, the system returns the user to the command (tasks request) level and asks for a new command. Enter is used to store the data entered on a screen form in the system's memory. Help displays information on the type of data that can be entered into the field associated with the current cursor position. The system displays all the permissible entries the user can input for that field. This key can be pressed at the "enter command" level to obtain a list of all commands.

System Login Procedure

Forced Password Aging and Administrable Logins

The system provides enhanced login/password security by adding a security feature that allows users to define their own logins/passwords and to specify a set of commands for each login. The system allows up to 11 customer logins. Each login name can be customized and must be made up of from 3 to 6 alphabetic/numeric characters, or a combination of both. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Password aging is an optional feature that the super-user administering the logins can activate.

NOTE:

If several users are logging in and out at the same time, a user may see the message "Transient command conflict detected; please try later". After the "users" have completed logging in or out, the terminal is available for use.

The password for each login can be aged starting with the date the password was created, or changed, and continuing for a specified number of days (1 to 99). The user is notified at the login prompt, 7 days before the password expiration date, that the password is about to expire. When the password expires the user is required to enter a new password into the system before logging in. If a login is added or removed, the "Security Measurement" reports are not updated until the next hourly poll, or a **clear measurements security-violations** command is entered. Once a non-super-user has changed the password, the user must wait 24 hours to change the password again.

Security is enhanced by providing a logoff notification screen to a system administrator at log off while either the facility test call or remote access features are still administered. The administrator can be required to acknowledge the notification before completing the logoff process. Logoff notification is administered on the Login Administration screen.

Systems are delivered to the customer with one customer "super-user" login/password defined. The customer is required to administer additional login/passwords as needed. The super-user login has full customer permissions and can customize any login created.

Login permissions for a specified login can be set by the super-user to block any object that may compromise switch security. Up to 40 administration or maintenance objects commands can be blocked for a specified login in.

System commands are grouped into three command categories. Each of the three command categories has a group of command subcategories listed under them, and each command subcategory has a list of command objects that the

commands acts on. A super-user can set a users permissions to restrict or block access to any command in these categories. The three main categories are:

- Common Commands
 - Display Admin. and Maint. Data
 - System Measurements
- Administration Commands
 - Administer Stations
 - Administer Trunks
 - Additional Restrictions
 - Administer Features
 - Administer Permissions
- Maintenance Commands
 - Maintain Stations
 - Maintain Trunks
 - Maintain Systems
 - Maintain Switch Circuit Packs
 - Maintain Process Circuit Packs

These categories are displayed on the Command Permissions Categories form.

To Log In

1. Enter your login name and password on the login and password screen.

If your password has expired, you see the message:

```
Your password has expired, enter a new one.
```

```
Reenter current password:
```

```
Login: telmgr

Password:
Your Password has expired, enter a new one.

Reenter Current Password:

        New Password:

Reenter New Password:
```

Figure 3-1. Password Expiration Screen

The Password Expiration screen displays when you log in. See [Figure 3-1](#). If your password is expired, you are prompted to enter a new password. If your password is within 7 days of the expiration date, you see:

```
WARNING: Your password will expire in X days
```

To Logoff

To logoff, enter “logoff” at the command prompt. You will receive a logoff screen if any of the following is true. If either a or b (see below) is true and an acknowledgment is required, or if any of c, d, or e is true, you need to respond to the “Proceed with Logoff?” prompt on the logoff screen. See [Figure 3-2](#). The response is defaulted to “n”; you will need to enter “y” to override the default.

- a. If Facility Test Call Notification has been enabled for your login (see Adding Customer Logins and Assigning Initial Passwords).
- b. If Remote Access Notification has been enabled for your login (see Adding Customer Logins and Assigning Initial Passwords).
- c. If Alarm Origination is disabled.
- d. If any active major or minor alarm is active.
- e. If any resource is busied out.

**CAUTION:**

To leave the Facility Test Call administered after you logoff poses a significant security risk.

**CAUTION:**

To leave the Remote Access feature administered after logging off poses a significant security risk if you are using the feature in conjunction with the Facility Test Call feature.

⚠ CAUTION:
No alarms report through the INADS interface if Alarm Origination is disabled.

⚠ CAUTION:
A busied out resource is one that is out of service. Be sure to verify if a busied resource needs to be released or if the resource should remain busied out.

```
Facility Test Call Administered
Remote Access Administered
Alarm Origination is currently disabled.
Active major or minor alarm detected; be sure to resolve it.
*** Busied out resource detected; verify if release is needed! ****

Proceed With Logoff: [n]
```

Figure 3-2. Logoff Screen

To Display a Login

1. Enter the command **display login [login name]** and press Enter.

The system displays the requested login's:

- Name
- Login type
- Service level
- Disable following a security violation value
- Access to Inads Port value

- Password aging cycle length
- Facility test call notification and acknowledgment
- Remote access notification and acknowledgment

To List Logins

1. Enter the command **list logins**.

The system displays the following information for all current logins:

- Name
- Service level
- Status (active, inactive, disabled, svn-disabled, void)
- Password aging cycle length

The system displays only those logins with the same, or lower, service level as the requestor.

To Remove a Login

1. Enter the command **remove login [login name]**.

The system displays the Login Administration form.

2. Press the ENTER key to remove the login, or press Cancel to exit the remove login procedure without making a change.

Administering Customer Logins and Forced Password Aging

Adding Customer Logins and Assigning Initial Password

To add a customer login you must be a super-user, have administrative permissions, and:

1. Enter the **add login [name]** command to access the Login Administration form.
2. Enter your super-user password in the Password of Login Making Change field on the Login Administration form.

The 3- to 6-character login name (characters 0-9, a-z, A-Z) entered with the **add login [name]** command is displayed in the Login's Name field.

3. Enter "customer" in the Login Type field. The system default for the Login Type field is "customer." The maximum number of customer logins of all types is 11.
4. Enter super-user or non-super-user in the Service Level field. Default is none-super-user.

- “super-user” gives access to the **add, change, display, list, and remove** commands for all customer logins and passwords. The super-user can administer any mix of super-user/non-super-user logins up to a total of ten additional system logins.
 - “non-super-user” permissions are limited by restrictions specified by the super-user when administering the non-super-user login. A non-super-user can change his/her password with permission set by the super-user, however once a password has been changed the non-super-user must wait 24 hours before changing the password again. A non-super-user cannot change other user passwords, login characteristics, or permissions.
5. Enter **y** in the Disable Following a Security Violation field to disable a login following a login security threshold violation,. This field is a dynamic field and only appears on the Login Administration form when the SVN Login Violation Notification feature is enabled. The system default for the Disable Following a Security Violation field is **y**.
 6. Enter **y** in the Access to INADS Port? field to allow access to the remote administration port,. This field only displays if Acct. has first enabled customer super-user access to the INADS Remote Administration Port. Default is **n**.
 7. Enter a password for the new login in the Login’s Password field. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Valid characters include numbers, and!&*?;’^ (),.- (the system will not echo the password to the screen as you type).
 8. Re-enter the password in the Login’s Password field. The system will not echo the password to the screen as you type.
 9. Enter the number of days (1 to 99) from the current day, that you want the password to expire, in the Password Aging Cycle Length field. If a you enter a blank in this field, password aging does not apply to the login.
 10. Decide whether or not to leave the default of yes (**y**) in the Facility Test Call Notification? field. If **y** is selected, the user receives notification at logoff that the facility test call feature access code is administered. If you do not want the notification to appear, set the field to **n**.

**CAUTION:**

Leaving The facility Test Call administered after logging off poses a significant security risk.

11. Decide whether or not to leave the default of yes (**y**) in the Facility Test Call Notification Acknowledgment Required field. If **y** is selected, the user is required to acknowledge that they wish to logoff while

Facility Test Call is still administered. If you do not want to force the user to acknowledge, set the field to **n**. This field appears only if the Facility Test Call Notification field is set to **y**.

12. Decide whether or not to leave the default of yes (**y**) in the Remote Access Notification? field. If **y** is selected, the user receives notification at logoff that remote access is still administered. If you do not want the notification to appear, set the field to **n**.

**CAUTION:**

To Leave Remote Access feature administered after logging off poses a significant security risk if you are using the feature in conjunction with the Facility Test Call feature.

13. Decide whether or not to leave the default of yes (**y**) in the Remote Access Acknowledgment Required? field. If **y** is selected, the user is required to acknowledge that they wish to logoff while remote access is still administered. If you do not want to force the user to acknowledge, set the field to **n**. This field appears only if the Facility Test Call Notification field is set to **y**.

```

                LOGIN ADMINISTRATION

Password of Login Making Change:

LOGIN BEING ADMINISTERED
                Login's Name:xxxxxxx
                Login Type:
                Service Level:
Disable Following a Security Violation?
                Access to INADS Port?

LOGIN'S PASSWORD INFORMATION
                Login's Password:

                Password Aging Cycle Length:

LOGOFF NOTIFICATION
Facility Test Call Notification? y      Acknowledgment Required? y
Remote Access Notification? y         Acknowledgment Required? y
```

Screen 3-1. Login Administration**Changing a Login's Attributes**

To change a customer login's attributes you must be a super-user, have administrative permissions (specifically, the Administration Permission field must be set to **y** for the super-user), and:

1. Enter the **change login [name]** command to access the Login Administration form.

2. Enter your super-user password in the Password of Login Making Change field on the Login Administration form. The 3- to 6-character login name (characters 0-9, a-z, A-Z) entered with the **change login [name]** command is displayed in the Login's Name field.
3. Enter **customer** in the Login Type field.
4. Enter **super-user** or **non-super-user** in the Service Level field.

⇒ NOTE:

You cannot change your own service level.

5. To disable a login following a login security threshold violation, enter **y** in the Disable Following a Security Violation field. This field is a dynamic field and only appears on the Login Administration form when the SVN Login Violation Notification feature is enabled.
6. To allow access to the remote administration port, enter **y** in the Access to INADS Port? field. This field displays only if Lucent Technologies has first enabled customer super-user access to the INADS Remote Administration port.
7. Enter a password for the new login in the Login's Password field. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Valid characters include numbers, and !&*?;'^(),.- (the system does not echo the password to the screen as you type).
8. Re-enter the password in the Login's Password field. The system does not echo the password to the screen as you type.
9. Enter the number of days (1 to 99) from the current day, when you wish the password to expire, in the Password Aging Cycle Length field. If a blank is entered in this field, password aging does not apply to the login.

Administering Login Command Permissions

Users with super-user permissions can set the permissions of the logins they create. The Command Permissions Categories form displays fields to which a user with super-user permissions can give or limit access. These commands are divided into three categories:

- Common Command
- Administration Commands
- Optional Maintenance Commands

Each of the three main categories have subcategories listed under them that when set to **y** give permission to use the command sets associated with that category. When the Command Permissions Categories form is displayed for a login, the subcategories fields appear with the fields set to give the login full permissions for that login type. The super-user administering login permissions can set any of these field to deny access to a command category for the

specified login. If the super-user making the assignments has full super-user permissions and would like to limit permissions for a category, the super-user can do so by entering **y** in the `Additional Restrictions` field located under the Administration Category section of the Command Permissions Categories form.

Refer to the Command Permissions Form Entries Tables at the end of this section for a list of command Objects and Actions by:

- Display Administration and Maintenance
- Administer Features
- Administer Permissions
- Administer Stations
- Administer Trunks

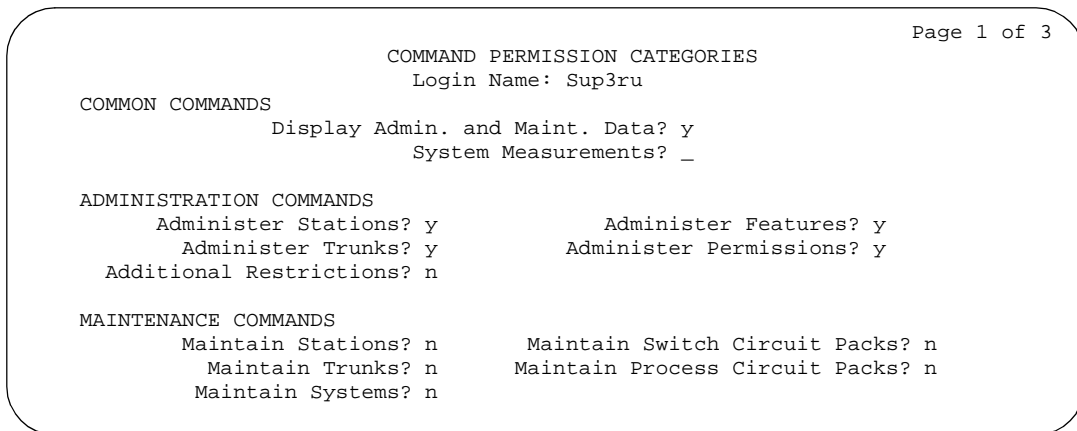

The information in the tables will help you to establish command permissions for user logins.

To administer command permissions, log in as super-user and:

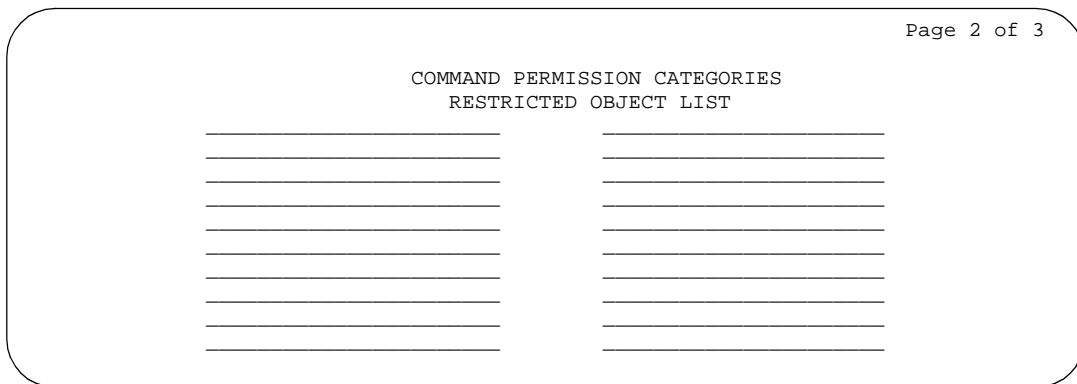

1. Access the Command Permissions Categories form by entering **change permissions login [login name]**. When the form is displayed for a login, the default permissions for that "login type" are shown. The super-user administering the login can change a **y** to **n** for each subcategory field.
2. Select a category for the login and enter **y** in each field where permission to perform an administrative or maintenance action is needed. The command object you select must be within the permissions for the login type you are administering.

If the Maintenance option is set to **y** on the Customer Options form, the super-user can enter **y** in the `Maintain Switch Circuit Packs?` or `Maintain Process Circuit Packs` fields.

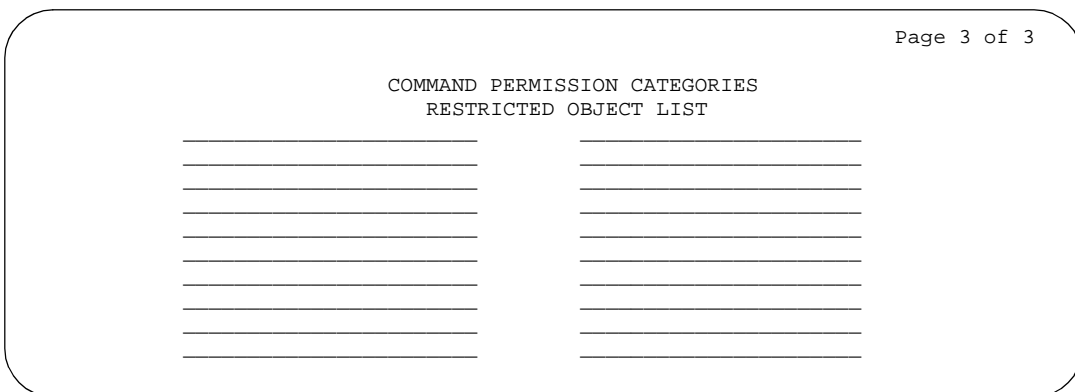

3. A super-user with full super-user permissions (super-user administering the login cannot have the `Additional Restrictions` field set to **y** for his/her own login) can restrict additional administrative or maintenance actions for a specified login by entering **y** in the `Additional Restrictions` field on the Command Permission Categories form. Enter the additional restrictions for a login in the `Restricted Object List` fields on the Command Permission Categories Restricted Object List form. You can enter up to 40 command names (object names) to block actions associated with a command category for a specified login.

Testing a Login

1. Enter your login name at the login prompt.

Login: telmgr

Password:

Screen 3-5. Login Prompt Form

After the user enters the correct login name and password and the login is administered correctly, the system displays the command line interface.

To log into the system, do the following:

1. Turn on the administration terminal. Verify that the screen displays:
login:
2. Enter your login name, then press Enter. Verify that the screen displays:
password:
3. Enter your password, then press Enter.

For security reasons, the password is not displayed as you type it. The system verifies that a valid login and password name were entered. If an invalid login or password name is entered, the screen displays:

login incorrect:, and you must repeat the procedure.

If the system recognizes the login and password name, verify that the system displays the software version.

4. For your terminal type, complete one of the following:

Terminal Type (Enter 513, 715, VT220, 4410, or 4425): [513]

- a. If the terminal is a 513 BCT, press Enter. The 513 in brackets [513] is the system default terminal.
 - b. If the terminal is a 610 BCT or a 615 MT that has a 513 emulation cartridge, press Enter.
 - c. If the terminal is a 610 BCT or a 615 MT that does not have a 513 emulation cartridge, enter 4410 and press Enter.
 - d. If the terminal is any other of the types listed, enter the terminal type and press Enter.
5. You can deactivate INADS alarm origination whenever you log in as craft. After you supply the terminal type information requested, the system displays the following if alarm origination is activated on the Maintenance System-Parameters screen:

⇒ NOTE:

Unless you are in a special situation, please reduce unnecessary trouble tickets by always answering “y” to the following prompt to suppress Alarm Origination.

Suppress Alarm Origination: [y]

The default answer is y. If you do NOT wish to suppress alarm origination, enter no. Any other entry defaults to y. The **test inads-link** command works regardless of whether you have overridden INADS alarm origination or not.

6. Verify that the screen displays: enter command:

You may enter the desired command, such as **display station xxxx** or press **Help** to obtain the list of permissible commands.

Command Line Details

After a successful login, the administration terminal displays `enter command:` and waits for entry of a command.

A command is made up of multiple words that are typed on the keyboard and that instruct the system to perform a particular task. The system's command structure follows the format: Action, Object, and Qualifier.

The first word entered is the *Action*. It specifies the operation to be done (for example, test, display, or reset).

The second word entered is the *Object*. It specifies the object to receive the action (for example, station, trunk group, or hunt group).

The third word(s) entered is/are the *Qualifier*. The Qualifier is one or more words or digits used to further identify or complete the Object. Depending on the Object used, a Qualifier may or may not be used.

An example of a command line used to do a short test twice on a station with the extension number 1212 is: `test station 1212 short r 2`. In this example, `test` is the Action, `station` is the Object, and `1212 short r 2` is the Qualifier.

Spaces separate the Action, Object, and Qualifier on the command line.

NOTE:

Command line words do not have to be completely spelled out. All that is required is to type enough letters to make the word unique.

Screen Forms

After the user completes a command line, the terminal displays the appropriate screen form(s). Screen forms are system-generated forms that are formatted to allow easy entry of translation data.

Screen forms enable the user to change the translations of the system by typing parameters on the keyboard. Screen forms also allow system technician to display errors and alarms. Each screen form consists of a title, page number, body area, and a help and error message line. Specific screen forms exist for each type of administrable function.

DEFINITY ECS — Administrator's Guide contains detailed information and examples of the screen forms generated by the system.

Switch-Based Bulletin Board

This feature (G3V3 and later) allows a user to leave messages in the system in order to communicate with other system users.

NOTE:

This feature is not intended as a substitute for the existing procedures for escalating problems, but only as an aid to the existing process.

Description

The bulletin board service provides an easy interface for the customer and Lucent Technologies to leave messages on the system.

The bulletin board feature makes it easy for the customer to communicate with Lucent Technologies (and vice-versa). For example, when a new load is installed on a switch in the customer's system, Lucent Technologies can leave the customer messages which describe new functionality. This feature also allows Lucent Technologies to keep the customer informed on the progress of trouble items. In addition, the feature can be used by the customer to provide additional information concerning problems that have already been escalated.

Accessing the Bulletin Board

Any user with the appropriate permissions can log into the system and have access to the bulletin board. User's who have "Maintain System" or "Administer Features" permissions can enter, change, display, print, or schedule to print a message. Users who have "Display Admen" and "Maintain Data" permission can display the bulletin board. Any user who has "Display" permission can display, print, and schedule to print the contents of the bulletin board.

When logging onto the system, users will be notified of any messages on the bulletin board. The notification message will indicate the last time the bulletin board was updated, if any "High-Priority" message exists, and if the bulletin board is 80% or more full. If a "High-Priority" message exists, the command prompt will change to the following message:

- High-Priority Bulletin Board Messages Entered:

After the next command is entered, the default command prompt returns to the screen.

User Considerations

- Only one user at a time may edit a message on the bulletin board.
- The user must have the proper permissions to access the bulletin board.

- The user must maintain the information stored on the bulletin board. It is the user's responsibility to delete old messages. If the bulletin board is full, any new messages overwrite old messages.

System Considerations

The Bulletin Board feature provides up to 3 pages of text for each message. Each page is limited to 20 lines of text, and each line of text is limited to 40 characters per line. The first 10 lines of text on page 1 is reserved for Lucent Technologies Service's High-Priority messages.

System Bulletin Board Commands

The system commands **change bulletin board**, **display bulletin board**, and existing commands in the user interface are provided for use in the Switch-Based Bulletin Board.

Editing a Bulletin Board Message

1. Log into the system with "Maintain System" or "Administer Features" permissions.
2. Enter the command **change bulletin-board**.
3. Follow system prompts.

To display messages on the Switch Based Bulletin Board the user must:

1. Log into the system with "Maintain System", "Display Admin", or "Maint Data" permissions.
2. Enter the command **display bulletin board**.
3. Follow system prompts.

Editing a Switch-Based Bulletin Board Message

A message may contain up to three pages of information. Message lines 1 through 10 on page 1 are reserved for Lucent Technologies Services *High-Priority* messages (the "init" and "inads" logins can edit the first 10 lines on page one). Pages 2 and 3 will allow up to 20 lines of text, and each line of text may be up to 40 characters per line. Each line of text has an associated date field that is populated automatically by the system each time the line is modified.

The control keys used to edit existing feature forms must be used to edit a message in the Switch Based Bulletin Board. The following characters are allowed for use in the text field:

- Uppercase/Lowercase letters, spaces, numerals, and !@#\$%^&*()_-+=[{};'"<>./?.

⇒ NOTE:

Tab characters are not allowed. The existing command line interface will cause the cursor to move to the next field if a Tab character is entered.

If a user changes any lines that cause two or more consecutive blank lines, then the bulletin board will be automatically reorganized (upon submittal). Two or more blank lines will be consolidated into a single blank line. If a blank line is at the top of a form, it will also be deleted. This function will help prevent holes in the bulletin board screens as old entries are deleted.

To save a message entered into the bulletin board text field, the user must execute the **save translation** command.

The following screen is an example of bulletin board messages between Lucent Technologies and a customer who is having trouble with trunk group translations:

```
display bulletin-board          Page 1 of 3

      Messages (* indicates high-priority)      Date

* Lucent is in the process of                  02/02/95
* investigating your trunk lockup problem.    02/02/95
* The Bulletin Board will be updated as      02/02/95
* information is found.                       02/02/95
* We have identified the problem.             02/02/95
* The trunk you added does not provide        02/02/95
* disconnect supervision, however your trunk  02/02/95
* group was administered as such.            02/02/95
* Please call for details.                   02/02/95
*

We recently added a new trunk group (14)      02/03/95
and have had trunk group members locking up. 02/03/95
We see the error - Thanks for checking.      02/03/95
```

System Logoff Procedure

The system logoff procedure should be done any time the terminal is not being used. This assures that system translations are not accidentally corrupted. The **monitor system** command, when canceled, automatically causes a terminal user to be logged off and, thus, prevents unauthorized use of the terminal. Use the following procedure to log off the system:

1. Verify that the screen displays: `enter` command:
2. Enter **logoff** and press Enter. The screen displays: `login`:

If after either logging on as system technician or issuing a system technician command no additional command is issued for 30 minutes, an automatic time-out and logoff occurs. At that time, any alarms in the system previously unreported to INADS are reported. If you are logged in at two separate

administration terminals, the system waits until the second terminal times out or until you log off before reporting such alarms to INADS.

Logoff Notification alerts system administrators if features that present a significant security risk are enabled. A message displays on the system administration/maintenance interface. Additionally, the user can be required to acknowledge the notification before the logoff is completed.

DEC VT220 Terminal

The system supports use of the DEC VT220 connected to the system and used in the same way as the other terminals. When logging in, at the terminal-type prompt the user should enter "VT220" to initialize the correct parameters. Keyboard definitions shown in [Table 3-5](#) are in effect:

Table 3-5. Keyboard Definitions for the DEC VT220 Terminal

Initialization and Recovery

4

When the system is initially powered up, or when it experiences a catastrophic fault that interrupts its basic functions, the system either initializes or reboots.

Initialization

Upon initialization, no forms (not even Customer Options) are available until the Offer Category is set. (The remote INADS channel is available.) To set the customer options, do the following:

1. Enter **change system-parameters offer-options** (init and inads logins only) and the following form displays:

```
change system-parameters offer-options
```

```
OFFER OPTIONS FORM
```

```
Offer Category: _  
Activate Offer? _
```

```
WARNING: Need to save translations and reboot to make the change permanent.
```

Field descriptions

Offer category

Type either **A** or **B**.

Activate offer?

Type **y** if the entry for Offer category is correct and press Enter.
Type **n** if there is an error in the Offer category field and press Tab. Re-enter the correct Offer Category.

2. After these two fields are filled and you press Enter, the system displays:

WARNING: Activating Offer Category may set unchangeable limits.

This is to let you know that the Offer Category along with the model determine the system capacities (limits) and allowable hardware.

3. Select the **Submit** option to submit the form.
4. Use the **save translations** command to make the changes permanent.

**CAUTION:**

To avoid potential loss of service, ensure that your system's translations are protected by saving them to the PCM/CIA card.

Reset commands

Besides “reboot,” there are several less severe resets available to the system that allow it to recover from disrupting errors. The user can initiate these resets by using the reset system commands. These commands are used to manually restart the system at various levels, depending on the required test activity. The reset system commands are discussed in [Chapter 8, “Maintenance Commands and Trouble-Clearing Aids”](#).

A system is reset due to a loss of power, or via one of the following:

- Reset commands at the administration terminal.
- Maintenance software, from which the system can reset itself. (This process starts when certain software and hardware errors are detected by the software.)
- “Interchange,” which is a type of reset that can be scheduled as part of daily maintenance in High or Critical Reliability systems.

**WARNING:**

When the system is rebooted or reset at level 2, 3, 4, or 5, all voice terminal and attendant console features are adversely affected. Users should be advised of services that are lost and that, as a result, must be reactivated. See “Removing Power” in [Chapter 5, “Routine Maintenance Procedures”](#).

The administration terminal display and circuit pack LEDs indicate the progress of the recovery process. LEDs are discussed in [Chapter 7, “LED Interpretation”](#).

The sections that follow discuss successful system resets. For each level of reset, a typical administration terminal display is provided. Note that any hexadecimal numbers shown in parentheses, such as “(=8B89),” are only examples and are subject to change. Subsequent sections discuss the recovery

process following an SPE-Down Mode and for "duplication interface-processing element communication down."

⇒ NOTE:

If any of the diagnostic tests fail, the system may or may not function properly, and the LMM may or may not proceed with the restart. If the LMM does not proceed with the restart, the system goes into SPE-Down Mode. In failure cases, the appropriate part (for example, the Processor circuit pack) should be replaced.

⇒ NOTE:

Use and check the results of the **set/get vector** command found in the "Set Commands" section in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#), to determine how much time should be added for the recovery levels. Also, if an update file is applied on a system reset, add from 30 seconds to one minute to the recovery time for that reset.

Reset System 1 (System Warm Start)

This recovery takes about 30 seconds. All stable phone calls remain up. In-progress calls are dropped. No new calls can be made during this time.

In this restart, all software (Oryx/Pecos, drivers, maintenance, and so forth.) is reset.

Typical Display

```
RESET 1 (WARM) PERFORMED
```

Reset System 2 (System Cold Start Without Translations Loading)

All Port circuit packs are reset. All telephone sessions are dropped. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes.

In this restart, all software (Oryx/Pecos, drivers, maintenance, and so forth) is reset. In addition, the TDM Bus and all port circuit packs are reset. Typical displays follow:

Typical display

```
INTERNAL REGISTER TEST      PASSED
LOCAL BUS TEST              PASSED
ROM CHECKSUM TEST          PASSED
CONTROL STATUS TEST        PASSED
DCACHE TEST                PASSED
ICACHE TEST                PASSED
WRITE BUFFER TEST          PASSED
BTO TEST                   PASSED
TIMER TEST                 PASSED
RESET 2 (COLD_2) PERFORMED
```

Reset System 3 (System Cold Start With Translations Loading)

Emergency Transfer is invoked. Translations reload from translation card. Depending on the translations, the reloading process could take from five to 30 seconds. Thereafter, all port circuit packs are reset, and all telephone sessions drop. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes.

In this restart, all software (Oryx/Pecos, drivers, maintenance, and so forth) is reset. After the software is reset, all translations load from translation card. In addition, the TDM Bus and all port circuit packs are reset. Typical displays follow:

Typical display (TN790B)

```
INTERNAL REGISTER TEST      PASSED
LOCAL BUS TEST              PASSED
ROM CHECKSUM TEST          PASSED
CONTROL STATUS TEST        PASSED
DCACHE TEST                PASSED
ICACHE TEST                PASSED
WRITE BUFFER TEST          PASSED
BTO TEST                   PASSED
TIMER TEST                 PASSED
RESET 3 (COLD_1) PERFORMED
```

Reset System 4 (System Reboot)

Emergency Transfer is invoked. The boot image is already in the flash ROM memory. The system reboots immediately after the LMM performs a series of diagnostics on the processor and memory. Translations reload from the translation card. Depending on the translation, the reloading process takes from five to 30 seconds.

Thereafter, all port circuit packs are reset, and all telephone sessions drop. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes. Typical displays follow:

Typical display (TN790B)

```
INTERNAL REGISTER TEST      PASSED
LOCAL BUS TEST              PASSED
ROM CHECKSUM TEST          PASSED

RAM DATA CHECKSUM TEST       PASSED
RESET 4 (EXT REBOOT) PERFORMED
```

**Reset System 5 (System Reboot and
Run All 24-Hour Tests)**

Emergency Transfer is invoked. The LMM performs a series of diagnostics on the processor, on memory, and on memory card. Some diagnostics perform twice. This takes less than three minutes.

The boot image is already in the flash ROM memory. The system reboots immediately after the LMM performs a series of diagnostics on the processor and memory. Translations reload from the translation card. Depending on the translation, the reloading process takes from five to 30 seconds. Thereafter, all

port circuit packs are reset, and all telephone sessions drop. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes. Finally, scheduled maintenance is initiated. Typical displays follow:

```

Reset System Interchange (High or Critical Reliability Systems Only)

SPE-interchange (system hot start) is denoted by an "i" in the initcauses log. This restart is used to transfer control from the Active SPE to the Standby SPE in the least disruptive manner. Interchange (i) is the most transparent of all levels of restart and causes no disruption of service to telephone users. This restart takes fewer than two seconds.

⇒ NOTE:

The administration terminal is logged off. No diagnostics are performed, and only the login prompt displays.

An interchange (i) can be performed in one of the following three ways:

- a. System Technician-Demanded: using the **reset system interchange** command
- b. Scheduled Maintenance
- c. Software-Requested: The software requests the interchange when it determines that the Standby SPE is healthier than the current Active SPE

⇒ NOTE:

For most SPE alarms, interchange to the standby SPE is achieved using the hot restart (i). However, there may be other alarms for which another restart level (1 through 4) must be used to achieve a transition to the Standby SPE. See [Table 6-2, "Software-Requested Interchanges Caused by Alarm Conditions"](#) in [Chapter 6, "Reliability Systems: A Maintenance Aid"](#), for a complete list of alarms and restart levels.

Procedure for SPE-Down Mode

Due to fatal hardware and software problems, it is possible for a system to go into SPE-Down Mode. In this mode, the system invokes emergency transfer and does not provide any other service. Moreover, while in this mode, the software does not (or cannot) run at all. In a high or critical reliability system the system goes into SPE-Down mode **only when both SPEs go into SPE-Down mode**.

There is an interface to the system by maintenance. The Processor circuit pack, is responsible for maintenance in a standard reliability system. In a high or critical reliability system, the maintenance is provided by the A-carrier Duplication Interface (DUPINT-A) TN772 circuit pack with help from the processor.

The administration terminal, which connects directly to the processor in a standard reliability system and to DUPINT-A in a high or critical reliability system, provides a very limited interface to the system. Technicians can display alarms or restart the system. Only a subset of control complex alarms displays.

The following are sample displays for SPE-Down mode and the alarms displayed.

Display for SPE-Down in a Standard Reliability system:

```
*****SPE DOWN MODE*****
```

```
You can display alarms and reset system(4).
SPE_DOWN->
```

[Screen 4-1](#) and [Screen 4-2](#) show all possible SPE-Down alarms in a standard reliability system and in a high or critical reliability system, respectively.

DISPLAY ALARMS:

Physical Name	Logical Name	On Board?	Alternate Name	Alarm Type	Date Alarmed	Date Resolved
-----	PROC_BD	y	-----	MAJOR	-----	-----
-----	MEM_BD_0	y	-----	MAJOR	-----	-----
-----	M_BUS	y	-----	MAJOR	-----	-----
-----	MAINT*	y	-----	MAJOR	-----	-----
-----	NETCON_BD	y	-----	MAJOR	-----	-----
-----	TAPE_UNIT	-----	-----	MAJOR	-----	-----
-----	NO_TAPE	-----	-----	MAJOR	-----	-----

Screen 4-1. Display Alarms Command

4 Initialization and Recovery

Procedure for SPE-Down Mode

4-10

* The "MAINT" designation is used for PR-MAINT.

Display for SPE-Down in a High or Critical Reliability System:

```
*****SPE DOWN MODE*****
```

You can display alarms [a|b] and reset system(4) [a|b].

SPE_DOWN->

[Screen 4-2](#) shows only one SPE-Down alarm in a high or critical reliability system after entering the **display b** command:

```
DISPLAY ALARMS B:
```

Physical Name	Logical Name	On Board?	Alternate Name	Alarm Type	Date Alarmed	Date Resolved
-----	PROC_BD	y	-----	MAJOR	-----	-----

Screen 4-2. Display Alarms (one SPE-Down)**⇒ NOTE:**

A standard reliability system tries to restart itself every 20 minutes. A high or critical system tries to restart itself every 10 minutes.

The first step is to determine the location of the problem. It is possible for two or more circuit packs to have failed. It is also possible for a fatal problem with one circuit pack to affect another circuit pack. This is especially true for the Processor and Memory circuit packs, where a failure in one affects the other. All three of the following methods should be employed to determine where the fatal fault lies.

1. Use **display alarms** command:

Issuing the **display alarms [a | b]** command at the administration terminal shows where maintenance thinks the problem lies. The alarms are a good indication of why the system went down. They should be used with the following two methods.

2. Observe red LEDs:

Observe the red LEDs on the circuit pack to determine where software or processor firmware (LMM) had a problem.

3. Use the **reset** command:

In 286 system, issuing the **reset** command (Standard Reliability system) or the **reset [a | b]** command (High or Critical Reliability system) causes the system to attempt a **reset system 4**. Observe all the diagnostics on the screen, and note if the LMM has a problem with any of the diagnostics, as this information should give a good indication of where the problem lies.

The procedure to get a system out of SPE-Down mode follows.

 **NOTE:**

This is important! If you cannot complete the first step or have problems with the maintenance interface, then the first step should be to replace the Processor circuit pack. In a high or critical reliability system the DUPINT-A circuit pack can also cause SPE-Down.

1. If the alarms indicate a tape failure, replace the tape or tape drive and go to Step 3. Otherwise, verify that there is a good tape in the tape drive. If a tape is not present or if either the tape or tape drive is defective, then restarting the system using the **reset** command causes the system to go down again.
2. In a High or Critical Reliability system, select a carrier to repair first.

When it is possible to accurately determine the location of the problem, use the **display alarms [a | b]** command to display alarms for both SPEs and check the red LEDs on the processor complex circuit packs. Select the carrier where the red LEDs indicate the circuit pack alarmed. Bring up the system on that carrier and then refer to Standby SPE Maintenance documentation to repair the Standby SPE.

In a Standard Reliability system or after a carrier is chosen in a High or Critical Reliability system, determine which circuit pack is defective by displaying alarms and observing the red LEDs (as discussed previously). Depending on the alarms, use [Table 4-1](#) to replace the circuit packs indicated, one by one, in the order shown.

Table 4-1. Order of Circuit Pack Replacement

Alarm	Suggested Circuit Packs To Replace
PROC_BD	1) Processor 2) Network Control
MEM_BUS	1) Processor 2) Network Control
PROC_MEM	1) Processor
OFFBD_MEM	1) Processor 2) Network Control
INVALID_ERR	1) Processor 2) Network Control
MAINT_BD	1) Processor 2) Network Control
NETCON_ABSENT	1) Network Control 2) Processor
NO_CARTRIDGE	1) Memory Card 2) Network Control 3) Processor

Procedure for Duplication Interface — Processing Element Communication Down

In a High or Critical Reliability system, it is possible for both SPEs to stop communicating with the A-carrier TN772 Duplication Interface (DUPINT-A) circuit pack. Thus, the DUPINT-A, which is in charge of maintenance, prints the following message on the administration terminal:

```
Duplication Interface-Processing Element Communication down
```

The system may continue to function on one of the SPEs. However, the system is not able to provide any interface to the administration terminal.

If the system is still providing service, connect the administration terminal to the Active SPE (check the amber LED on the Processor circuit pack). Then, if

4 Initialization and Recovery

Procedure for Duplication Interface — Processing Element Communication Down

4-13

software provides a login on the administration terminal, you can determine the problems via the **display alarms** command.

If the system is not providing service, there is a problem with the Processor circuit packs and/or DUPINT-A. Replace these circuit packs, one by one, until the system starts functioning normally.

4	Initialization and Recovery	
	<i>Procedure for Duplication Interface — Processing Element Communication Down</i>	<i>4-14</i>

Routine Maintenance Procedures

5

The following general purpose maintenance procedures may be used with other repair strategies to clear system-alarmed and user-reported troubles.

Suppress Alarm Origination [y]

When logged in as “craft”, no alarms are reported to INADS. After logging off, INADS automatically reactivates, and any unresolved alarms are reported to INADS.

Also, when logged in as “craft,” an automatic logoff of the terminal occurs after 30 minutes of non-use. At that time, any unresolved alarms are reported to INADS. If you are logged in as “craft” at 2 different terminals, the logoff occurs when the second terminal remains unused for 30 minutes.

 **NOTE:**

The **test inads-link** command functions even if INADS Alarm Origination is overridden.

Handling Control Circuit Packs

PPN Control Circuit Packs

 **WARNING:**

It is NOT recommended that you reseal circuit packs unless the documentation specifically instructs you to do so. If it is required to reseal a circuit pack, follow the instructions below which explain how to unseat, reseal, and replace circuit packs.

The procedures for unseating, reseating, and replacing control circuit packs vary depending on the system configuration. Therefore, before performing these maintenance activities, refer to the appropriate procedure below.

Procedure for a Standard Reliability Cabinet

To unseat a control circuit pack:

1. Remove power from the PPN using the procedure provided in [“Removing Power”](#).
2. Slide the latch pin upward to unlock the locking lever.
3. Pull down on the locking lever until the circuit pack disconnects from its socket.
4. Pull the circuit pack just enough to break contact with the backplane connector, but do not remove it from the cabinet.

To reseat a circuit pack:

1. Push the unseated circuit pack back into the backplane connector.
2. Lift the locking lever until the pin engages.
3. Restore power to the PPN using the procedure provided in [“Restoring Power”](#)

To replace Control circuit packs:

1. Remove power from the PPN using the procedure in the [“Removing Power”](#)
1. Unseat the circuit pack.
2. Slide the circuit pack out of the slot.
3. Replace the circuit pack as per the following procedure:

NOTE:

If a new circuit pack does not correct the problem, install the original circuit pack.

NOTE:

If you are replacing a TN790 circuit pack, refer to [“TN790 processor circuit pack”](#) in this chapter.

To install a new circuit pack or return the original one to service:

1. Carefully insert the circuit pack and push it all the way into its mounting slot.
2. Lift the locking lever until the latch pin engages.
3. Restore power to the PPN using the procedure in [“Restoring Power”](#).
4. Verify that the circuit pack LED indications are correct.

5. Test the replaced control circuit pack by issuing the system technician commands after power has been restored.

Network Control Circuit Pack

WARNING:

When a TN777B Network Control circuit pack is reseated or replaced, the correct date and time setting must be manually entered and verified.

The TN777B Network Control Pack holds a translation card. Before this circuit pack is handled, remove the translation card.

1. Check that the "card in use" LED is not lighted. Otherwise, removing the memory card may damage the data recorded on it.
2. Carefully pull the translation card from the card slot.

To insert the card into the slot:

1. Take the translation card and hold it in front of you so that the card's label is facing to your left.
2. With the card in this position, insert the shorter edge of the card into the mounting slot. Then, gently push the card forward until you feel some resistance at the opposite edge of the card. Once you feel this resistance, the card is inserted. About 3/4 of an inch of a fully inserted card should appear outside of the card slot.

WARNING:

Remember, assuming you are directly facing the circuit pack, the card label should be facing to your left. If this is not the case, remove the card and start again.

3. Test the inserted card by issuing the **test card-mem** system technician command.

EPN Control Circuit Packs

Control circuit packs are unseated, reseated, replaced, and tested in the same way as Port circuit packs. Refer to the ["Handling Control Circuit Packs"](#) section in this chapter. Note the special precautions required when handling the TN776 and TN570 Expansion Interface (EXP-INTF) circuit packs and the EPN TN768 and TN780 Tone-Clock circuit packs.

EPN Expansion Interface Circuit Packs

If the system has high or critical reliability, verify that the Expansion Interface to be unseated or replaced is NOT a part of the Active Expansion Interface Link. Issue the **status system** command. If the Expansion Interface circuit pack is shown to be a part of the Active Expansion Interface Link, use the **set expansion-link PCSS** command to make the current Standby link the Active one.

EPN Tone-Clock Circuit Packs

If the EPN has redundant Tone-Clock circuit packs, make sure the Tone-Clock to be unseated or replaced is the Standby circuit pack. Issue the **status system** command. If the Tone-Clock is shown as Active, use the **set tone-clock PC** command to make the current Standby Tone-Clock the Active one.

TN790 processor circuit pack

Processor Circuit Pack (Memory)

Unless upgrading memory, the TN790B must have the same number of SIMMs as the replaced circuit pack.

CAUTION:

Be sure to use a Lucent Technologies-provided SIMM. Other brands may have incompatible edge connectors and could produce unpredictable results.

Removing Power

When power is removed, the following features deactivate:

- Attendant Trunk Group Control
- Automatic Callback
- Call Park
- Make Busy for Direct Department Calling (DDC) and Uniform Call Distribution (UCD)

The procedures for removing power vary depending on the system configuration. Before performing these activities, refer to the following appropriate procedure.

WARNING:

Before powering down a cabinet or carrier that contains DEFINITY AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging the AUDIX software. Instructions for powering down this unit are in the

[“DEFINITY AUDIX System Power Procedures”](#) below, on the circuit pack, and in DEFINITY AUDIX documentation.

DEFINITY AUDIX System Power Procedures

Manually Power Down AUDIX System

A yellow caution sticker on the system's power unit notifies technicians to shut down the DEFINITY AUDIX System prior to powering down the system.

1. Using a pointed object, such as a paper clip or pen (do not use a pencil), press the Boot/shutdown button. The button is located at the top right portion of the front panel.
2. Hold the boot/Shutdown button in until the LCD display flashes the message MSHUT.
3. Release the Boot/Shutdown button.

NOTE:

The DEFINITY AUDIX System takes about five minutes to shut down. The “heartbeat” indication on the display continues to flash.

Procedure for a Single-Carrier Cabinet PPN

This procedure applies to a single-carrier cabinet PPN with or with high or critical reliability, where the cabinet is powered by either an AC or a DC power source.

WARNING:

If a translation card alarm is present, or if a translation card problem is suspected, do not save translations of the translation card that is provided with the system.

CAUTION:

Check that the translation card is present in the system or check that the translation card is in the TN777B Network Control circuit pack.

4. At the administration terminal, enter the **save translation** command.
5. In a standard reliability system on the Processor circuit pack in the PPN, and on the Maintenance circuit pack in the EPN, set the Emergency Transfer switch to "ON."

CAUTION:

*When removing power, Error Log information is lost. If the data is to be retained, enter the **reset system 4** command. This command restarts the system and may take several minutes. Wait for the login prompt before proceeding.*

6. To remove power from the cabinet:
 - In an AC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the carrier behind the WP-91153 Power Unit.
 - In a DC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the cabinet, behind the 676B Power Unit.

Procedure for a Single-Carrier Cabinet EPN

This procedure applies to a single-carrier EPN with or without high or critical reliability, where the cabinet is powered by either an AC or a DC power source.

Power may be removed from the EPN without affecting the PPN.

NOTE:

In a high or critical reliability system, if power is to be removed from an individual cabinet only, make sure that the affected cabinet does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. To remove power from the cabinet:
 - In an AC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the cabinet behind the WP-91153 Power Unit.
 - In a DC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the cabinet behind the 676B Power Unit.

Restoring Power

The procedures you need to restore power depend on the system configuration. Before performing these activities, refer to the following appropriate procedure.

NOTE:

If the AUDIX unit has been powered down, refer to [“Power Up the AUDIX System” on page 5-8](#).

Procedure for Single Carrier Cabinet PPN

This procedure applies to single-carrier cabinet PPNs with or without high or critical reliability, where the cabinet is powered by either AC or DC power.

⇒ NOTE:

In a high or critical reliability system, if power is to be removed from an individual cabinet only, make sure that the affected cabinet does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. Restore power as follows:

⇒ NOTE:

If the cabinet is powered by a 676B Power Unit, the 676B must have been powered off for at least 10 seconds before being powered on. If not, the 676B Power Unit does not restart.

- In an AC-Powered system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the WP-91153 Power Unit.
 - In a DC-Powered system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the 676B Power Unit.
2. Make sure that the translation card is properly inserted into the slot.
 3. The system now goes through the rebooting process. The translations are loaded from the translation card, and rebooting takes about three minutes.
 4. When system power is restored, the appropriate display is shown on the administration terminal.

The display is the same as a **reset system 4** that is described in [“Reset System 4 \(System Reboot\)”](#) in [Chapter 4, “Initialization and Recovery”](#).

5. After the system reboot is finished and all trouble is cleared, return the EMER XFER (Emergency Transfer) switch(es) to AUTO. This restores the system to the normal operating mode.
6. Reset the time using the **set time** command. Use **display time** command to verify.

Procedure for Single-Carrier Cabinet EPN

Power may be restored to the EPN without affecting the PPN.

This procedure applies to single-carrier cabinet EPNs with or without high or critical reliability, where the cabinet is powered by either AC or DC power.

⇒ NOTE:

In a high or critical reliability system, if power is to be removed from an individual cabinet only, make sure that the affected cabinet does not

contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. To restore power to the cabinet:

 **NOTE:**

If the cabinet is powered by a 676B Power Unit, the 676B must have been powered off for at least 10 seconds before being powered on. If not, the 676B Power Unit does not restart.

- In an AC-Powered single-carrier cabinet system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the WP-91153 Power Unit.
 - In a DC-Powered single-carrier cabinet system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the 676B Power Unit.
2. The EPN circuit packs is inserted and the EPN is available for call processing.
 3. After the system reboot is finished and all trouble is cleared, return the Emergency Transfer switch to AUTO. This restores the system to the normal operating mode.

Power Up the AUDIX System

1. Using a pointed object such as a paper clip or a pen (do not use a pencil), press the Boot/Shutdown button.
2. Hold the boot/Shutdown button in until the display indicates the message, **BTEST**, steady on.
3. Release the Boot/Shutdown button. the DEFINITY AUDIX system takes approximately 5 minutes to power up.
 - The display has the following sequence of steady on messages:
 - OSINIT
 - OS
 - AINIT
 - ADX
 - The DEFINITY AUDIX System is now powered up. When the system is in the active state, the display indicates **ADX**, and the red LED is off.

 **NOTE:**

When powering up, the DEFINITY ADUXI System automatically reboots. This sequence may show an MD or MJ ADX alarm in the display until the system has powered up. When the system has completed its power up sequence, the display reads: ADX.

Troubleshooting power units

Use the following procedures to troubleshoot the power unit:

1. Check that the translation card is in its slot.
2. Save the translations (**save translation**).
3. Set the EMER XFER (Emergency Transfer) switch on the Processor circuit pack in the PPN to ON. This locks the system in the Transfer Mode until the trouble is cleared.

 **WARNING:**

Electrostatic discharge can destroy or severely damage integrated circuits or circuit packs. Always wear the electrostatic discharge (ESD) wrist grounding strap when handling circuit packs. Connect the wrist strap to one of the metal tabs located on the lower left or right side of one of the carriers.

4. Unlatch both locking levers and unseat the power unit.

 **NOTE:**

If the 1217A yellow power supply LED is not lit, the unit has likely faulted due to overload conditions. However, the power supply continues to provide other output voltages ($\pm 5V$ DC and $-48 V$ DC) to circuit packs and does not completely shut down as earlier power supplies do if the $+12V$ fan or the $+12V$ DC tape drive outputs are overloaded.

5. Unseat all the *control* circuit packs.

 **CAUTION:**

Ensure that the customer administrator is aware that service is interrupted during this step.

6. Reseat the power unit. If the yellow LED on the suspect power supply lights immediately, the *control* circuit packs can be presumed to be healthy.
7. If the yellow LED on the suspect power supply does *not* light immediately, reseat the *control* circuit packs one at a time while observing the LED on the power supply.

- a. If the yellow LED on the power supply lights when a specific circuit pack is reseated, unseat and reseat the same circuit pack again to rule out a transient problem.
 - b. If the yellow LED lights again, the problem is with the circuit pack, and the power supply is functioning properly. Replace the defective circuit pack (see [“Replacing power supplies and fans”](#)).
8. If the yellow LED on the power supply does *not* light during the reseating of the *control* circuit packs, unseat all *port* circuit packs.
 9. Reseat the *port* circuit packs one at a time, as you did in Step 7 above.
 10. Check for power to the tape drive unit and fans. These devices use separate outputs from the power supply.
 11. If none of the control or port circuit packs appears to be defective, check the cabinet temperature.

 **NOTE:**

The 1217A power supply's thermal protection shuts it down if the incoming air temperature is greater than 50° C. (122° F.) at 10,000 ft. (3,049 m.) elevation or 60° C. (140° F.) at sea level.

12. If both the circuit packs and the ambient cabinet temperature can be eliminated as potential trouble causes, replace the power unit (see [“Replacing power supplies and fans”](#)).
13. Reboot the system.
14. When the system reboot has completed, return the EMER XFER (Emergency Transfer) switch to AUTO (restores the system to the normal operating mode).

Replacing power supplies and fans

General caution

Components can be replaced while the unit is attached to the wall. Also, if the wires and cables at the back of the cabinet are neatly bundled, these wires and cables need not be disconnected.

CAUTION:

When replacing either the power supply or the fans unit that is already attached to the wall, you should disconnect the entire fan panel from the unit. Otherwise, if the fan panel is left to dangle, the cable assemblies leading from the fans (connected to the fan panel) and into the backplane might become damaged or disconnected from the backplane.

Replacing the 1217A power supply

Use the following procedures below to replace the 1217A power supply, which can replace any of these power units:

- WP91153 L3
 - WP91153 L3A
 - WP91153 L4-25
 - WP91153 L4A-25
1. Power down AUDIX and any other circuit pack that might be running an application (for example, MAPD, TN802 may be running the Internet trunking application on Windows NT™).
 2. Power down the cabinet.
 3. Make sure you are wearing a ground strap.
 4. Release both latches on the power supply and slide the unit out of the cabinet.
 5. Before replacing the new power supply, ensure that the ring generator slide switch on the bottom of the unit is set to the appropriate frequency ([Table 5-1](#)):

Table 5-1. 1217A power supply ring outputs

Frequency	Application	Output voltage	Current
20 Hz. (position as shipped from vendor)	North America International	85V AC	0 - 180 mA
25 Hz.	International	72V AC	0 - 180 mA

6. Slide the unit into the slot and ensure that both latches snap closed.
7. Power up the cabinet.
8. Observe that the yellow LED is lit continuously.
9. If the yellow LED flashes, this indicates a power fault. See ["Troubleshooting power units"](#).

Replacing a 631AR or 631BR AC power unit

To replace either power unit use the following procedures and [Figure 5-1](#).

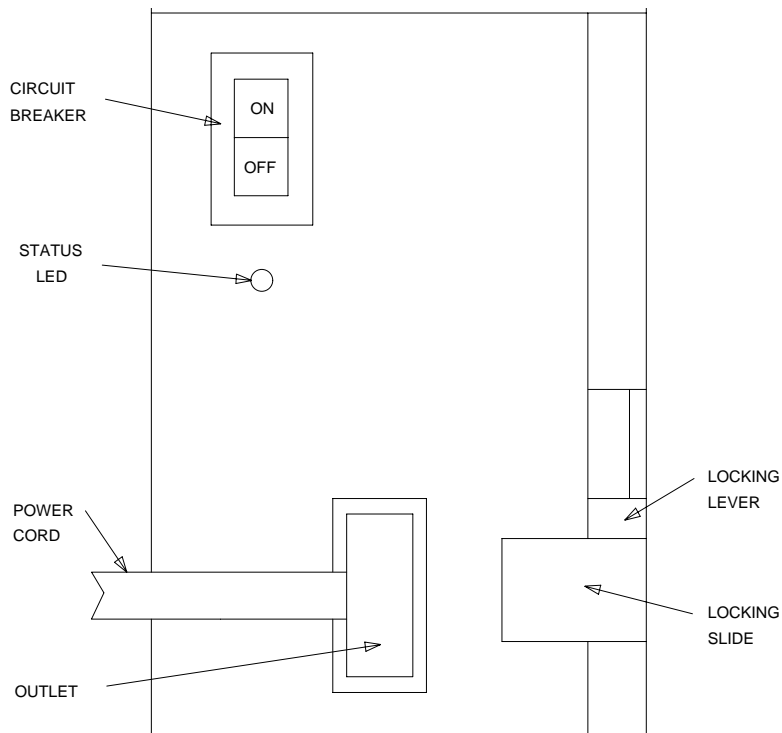

Figure 5-1. 631AR or 631BR AC Power Unit

1. Set the power switch to OFF, and unplug the power cord.
2. Move the locking slide on the power unit to its leftmost position and unlatch the locking lever.
3. Remove the power unit from the carrier.

4. Before installing the replacement power unit in the carrier, turn the power unit on its side and operate rocker switches 1 through 4 on the DIP switch as follows:

Switch	631AR Position	631BR Position
1	open	open
2	closed	closed
3	open	open
4	closed	open

NOTE:

In the open position, the rocker is down on the side opposite the number. In the closed position, the rocker is down on the side adjacent to the number.

5. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
6. Insert the power unit into the carrier until some resistance is felt.
7. Lift the locking lever upward until it latches.
8. Move the locking lever slide on the power unit to the extreme right position.
9. Connect the power cord and set the power switch to ON.

Replacing a 631DA or 631DB AC power unit

To replace the power unit use the following procedures and [Figure 5-2](#).

Figure 5-2. 631DA or 631DB AC Power Unit

1. Unplug the power cord.
2. Move the locking slide on the power unit to the extreme left position and unlatch the locking lever.
3. Remove the power unit from the carrier.
4. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
5. Insert the power unit into the carrier until some resistance is felt.
6. Lift the locking lever upward until it latches.
7. Move the locking lever slide on the power unit to the extreme right position.
8. Connect the power cord and set the power switch to ON.

Replacing a TN736 or TN752 power unit circuit pack

Replacing either power unit interrupts the -5 volt supply to the carrier. This causes all the analog circuit packs in the carrier to fail their Loop Around Tests and may cause failures in circuit packs in the control complex. After the power unit has been replaced, look for these alarms:

- ANL-LINE alarms — refer to Test #47 (Loop Around and Conference Test) in [“ANL-LINE \(8-Port Analog Line\), ANL-NE-L \(8-Port Neon Analog Line\)”](#).
- CO-TRK alarms — refer to Test #33 (Loop Around and Conference Test) in [“CO-TRK \(CO Trunk\)”](#).

All other power supplies

[Figure 5-3](#) and [Figure 5-4](#) provide views of the power supply sub-assembly. [Figure 5-5](#) provides a view of the fan sub-assembly. The sections following the figures discuss how to disassemble the unit and then replace the power supply or fans within the unit.

Figure 5-3. Power supply sub-assembly (outside view)

1. Remove the four screws on the top of the cabinet.

2. Remove the four screws from the fan panel at the rear of the unit.
3. Remove the fan panel.
4. If the unit is attached to the wall, disconnect the entire fan panel.
5. A cable assembly extends from the power supply and plugs into the backplane with a Burndy connector. Squeeze the sides of the connector to release the latch. Then pull the connector off of the backplane. See [Figure 5-4](#).

Figure 5-4. Power supply sub-assembly (inside view)

6. Remove the power supply from the unit. Once the power supply is removed, disconnect the AC power cord.
7. Reconnect the AC power cord, insert the new power supply, reconnect the Burndy connector and the cord, reinsert (if removed) the reconnected fan panel, screw the fan panel back onto the unit, and reinsert the screws on the top of the unit.

Fans

Refer [Figure 5-5](#) while performing the following steps to replace the fan assembly.

Figure 5-5. Fan sub-assembly

1. At the back of the unit, remove the four screws from the fan panel. Then remove the panel.
2. If the unit is attached to the wall, disconnect the entire fan panel.

CAUTION:

The power cord for each fan extends from a plug on the backplane. Do not tug on any of these cords. Otherwise, the corresponding plug on the backplane might come off.

3. Each fan has a power cord with a plug and receptacle at each end. Disconnect the plug for each fan that is to be replaced. Then remove the appropriate fan(s).
4. Install the new fan(s), reconnect the fan plug(s), reconnect the fan panel (if disconnected), and screw the fan panel back onto the back of the unit.

System Backup

System translations can be restored by using the data on the system or on the backup translation card if the length of power failure is appropriate for the corresponding system. [Table 5-2](#) lists the requirements:

Table 5-2. Requirements for System Backup

Minimum Length of Power Failure (min.)	System
2	Single-Carrier Cabinet Standard System
2	Single-Carrier Cabinet (High or Critical Reliability)

Save Translation

To ensure that the translation card contains the most recent copy of the translation data, the system can automatically save the translation data onto the translation card every 24 hours. Automatic daily backup of the system translation data is controlled by an entry in the system parameters that defaults to "daily".

If many translation data changes are made, it is recommended that you save the translation data using the **save translation** command. This action saves the new changes to the translation card without having to wait for the next automatic daily translation backup.

NOTE:

The **save translation** command blocks all maintenance commands except some **list**, **display**, **monitor**, and **status** commands.

The system blocks the execution of any commands that change translations or trigger a maintenance action (for example, **test board**, **busyout port**, and so forth). The **status card-mem** command is blocked during the save translation operation.

In a high or critical reliability system, if the **save translation** command is entered without a qualifier, an attempt is made to save the translations on *both* the Active and Standby SPE. If the command is qualified with either "spe-active" or "spe-standby," the translations are saved only on the specified SPE. For example, if, when the **save translation** command was issued, the translations were successfully saved on the active SPE's translation card, but were not successfully saved on the standby SPE's translation card, issue the **save translation spe-standby** command to save the translations on the standby SPE as well.

The system blocks the execution of any commands that change the translation, access a translation card, or trigger a maintenance action.

**CAUTION:**

It is recommended that "save translation" be performed after business hours so that dial tone delays are not encountered.

**CAUTION:**

Do not issue the "save translation" command when alarm conditions are present.

Save Recorded Announcements

In a high or critical reliability system, if the **save announcements** command is entered without a qualifier, an attempt is made to save the integrated announcements on *both* the Active and Standby SPE. If the command is qualified with either "spe-active" or "spe-standby," the integrated announcements are saved only on the specified SPE. For example, if, when the **save announcements** command was issued, the integrated announcements were successfully saved on the Active SPE's translation card, but were not successfully saved on the Standby SPE's translation card, then you would issue the **save announcements spe-standby** command to save the announcements on the Standby SPE as well.

**WARNING:**

The "save announcements" commands should only be used after business hours or when the system is operating during a low usage period. The system takes about 45 minutes to one hour to transfer the recorded announcements from the Announcement circuit pack to the system tape. During this interval, use of the administration terminal is blocked for other activities until the command completes.

Translation Card Backup

In case of a power failure, the system translations can be restored using the translation card. Translation data can be saved during the daily scheduled maintenance. However, if the translation data changes frequently, translations should be saved frequently to ensure that the most up-to-date information is kept.

Note that only one translation card is provided with the system. It is recommended that the customer purchase additional translation cards to serve as backup or replacement. Translation cards should be alternated periodically.

It is also recommended that backup copies of the translation data be made weekly, or after many changes have been made to the translation data. This minimizes the loss of recent translation data changes if the translation card in the system becomes damaged.

Enter the **save announcements** command to save the recorded announcements in the system on the translation card.

⇒ NOTE:

A 10 MByte or larger translation card is required to save and restore announcements.

The system takes about 10 minutes to complete this task. Because the terminal is unavailable during this time, it is recommended that this command be used after business hours. During this time period, the terminal cannot be used to administer the system until the transfer is complete; however, all other terminals (if provided) are allowed to perform administration procedures.

Enter the **restore announcements** command to restore the recorded announcements from the translation card back into system memory. The system takes about 22 minutes to complete this task. After completing the task, the system performs an audit to make sure that the announcements on the announcement circuit pack match the announcements administered in the system.

The working copy of the announcements is stored on the announcement circuit pack. A backup copy should be made on a 10 Mb or larger translation card. The following procedure is used to make a backup Memory Card:

1. Remove the translation card from the Netcon circuit pack.
2. Insert the backup translation card into the Netcon circuit pack.
3. Enter the **save translation** command and press Enter. This instructs the system to take all translation information in memory and transfer it into the translation card. The following display appears:

```
save translation                                     SPE A

                                     SAVE TRANSLATION

Processor                                     Command Completion Status      Error Code
SPE_A                                       Success                          0

Command successfully completely

enter command:
```

Screen 5-1. Save Translation — SPEA

4. Verify that the command successfully completes. If not, an error message appears. In such a case, refer to the "Translation Card Errors" section.

5. If the system is equipped with a TN750 Announcement circuit pack, the recorded announcements can be saved using the **save announcement** commands. Enter the command and press Enter. The following display appears:

```
save announcements
```

```
SAVE ANNOUNCEMENTS
```

Processor	Command Completion Status	Error Code
SPE_A	Success	0

```
Command successfully completely
```

```
enter command:
```

Screen 5-2. Save Announcements Screen — SPEA

6. Verify that the command successfully completes. If not, an error message appears. In such a case, refer to the “Translation Card Errors” section.
7. Remove the backup translation card and insert the original translation card.
8. Label the backup translation card with the date and time it was updated. A special notation on the card clearly distinguishes it from other cards.
9. Store the backup translation card in a secure place.

Translation Card Errors

Translation card-related failures may occur for two reasons: the card is at fault, or the Netcon circuit pack is at fault. The following is a list of the error messages and recommended responses to each.

1. Cannot access file storage area—Implies that the wrong translation card may be installed.

Response: Check to see which translation card is installed. If the correct one is installed, test it.

2. Cannot turn on 12 volt power supply—Implies that something may be wrong with the Netcon circuit pack, which contains the power supply.

Response: Test the 12-volt power supply by entering the **test card-mem** command from the terminal. Executing this command causes the system to run Test 701 (12 Volt Power Supply Test). If the power supply test fails, replace the Netcon circuit pack. Then repeat whichever command failed.

3. Invalid directory on Card-Mem — The translation card needs refreshing. Run **test card-mem** and be sure all tests pass.
4. Card-Mem is unusable — Something is wrong with the translation card. Replace the translation card.
5. Could not write to Card-Mem — Something is wrong with the translation card. Test the translation card.
6. Cannot access mass storage system now; try again later — The storage system is in use. Try again later.
7. Request is incompatible with currently running operations — The storage system is in use. Try again later.
8. Card-Mem is not inserted in the system — Insert the translation card.
9. Cannot access file; wrong type of Card-Mem is inserted — The correct translation card for the desired operation has not been inserted. Load the appropriate translation card.
10. File size exceeded — There is no more file space. Call your Lucent Technologies representative.
11. Upgrade Memory Card inserted — The system upgrade translation card may have been inserted instead of the translations card. Insert the translation card.
12. Card-Mem is write-protected — The switch on the top side of the translation card is incorrectly set. Move the switch to the down position.
13. Transmission problem; please try later — There is a problem communicating with the announcement circuit pack. Check to see that the announcement circuit pack has been correctly administered. Use the **change data <extension_number>** command. Verify that the announcement circuit pack is in the correct slot in the processor. If so, wait and retry.
14. Command has been aborted; please try later — The command was pre-empted. Try again later.
15. Saved copy of translations is unusable — The copy of the translations on your translation card is faulty. Re-enter the **save translation** command.

Software Upgrade

The software upgrade feature permits a DEFINITY System to upgrade its software to include new features and to fix software problems. Performing an upgrade on a system without high or critical reliability requires a **reset system 4** (reboot) and thus causes a service disruption. Performing an upgrade on a system equipped with high or critical reliability requires only a **reset system 2** (Cold-2) restart that is less disruptive.

WARNING:

No administration changes should be entered during the following software upgrade procedure. There can be substantial time gaps between steps and, since the system cannot prevent administration changes, it is up to the system technician to make sure that none are attempted during the entire software upgrade process.

NOTE:

This section does not apply to processor hardware upgrades such as upgrading a 386 system.

Procedure on a System using Translation Cards

The software can be upgraded to include new features and to fix software problems. Performing an upgrade on a standard reliability system requires a Reset System 4 (reboot) and thus causes a service disruption. Performing an upgrade on a high or critical reliability system requires only a Reset System 2 (Cold-2) restart, which is less disruptive.

CAUTION:

Do not enter any administration changes during the following software upgrade procedure. There can be substantial time gaps between steps and, since the system cannot prevent administration changes, it is up to the system technician to make sure that none are attempted during the entire software upgrade process. This includes making sure that no one (including the customer) is making administration changes through connections other than through the local administration terminal.

Standard Reliability (Simplex) Systems

The software upgrade for a standard reliability system can take up to 130 minutes, during which time service is interrupted for about 15 minutes. Upgrade software cannot be done remotely, and it must be performed at the local terminal. Ensure that the following items are available before proceeding:

- Generic program card with the software release running currently in the system
- Generic program card containing the new software to which the upgrade is to be done
- Translation card on which the system translations are to be saved (the card should already be in the system)
- Software patch (if it exists) that is currently applied to the system (this patch is downloaded if a software backout is required)
- Software release label to be applied to the processor circuit pack after a successful upgrade.

The following table indicates the processes and their corresponding time allotment for the upgrade procedure.

Process	Time (minutes)
save translation	10
save announcement	45
upgrade software	10
save translation	10
save announcements	45
miscellaneous	10
Total Time	130

[Figure 5-6](#) illustrates the output that appears on the terminal during the upgrade procedure.

Figure 5-6. Typical Start-up Messages (TN790)

Save Current Translations to Original Translation Card

1. Set the write switch on the original translation card down to record. Insert the card into the slot on the TN777B faceplate.
2. Enter **save translation** and press **Enter** to save translations to the translation card (approx. 10 minutes). The yellow LED on the TN777B is on. If the translations were corrupted, the following error message displays when logging in:

WARNING:

Translation corruption detected; call Lucent Technologies distributor immediately.

NOTE:

The **save translation** command cannot function if the translation corruption message appears.

Disable TTI

Enter **change system-parameters features** and press Enter. Use Page 2 of the form to disable Terminal Translation Initialization (TTI) by changing the value to **n**.

List Configuration Software Version

Issue the **list configuration software-versions** command to determine if any patches have been applied.

NOTE:

If the system must be restored to the old software, download the correct patches.

Disable Scheduled Maintenance

Enter **change system-parameters maintenance**, and press Enter. Use this form to prevent scheduled daily maintenance from interfering with the update or upgrade.

NOTE:

If scheduled maintenance has begun, set the value of the "Stop Time" field to 1 minute after the current time. If scheduled maintenance has not yet begun, change the value of the "Start Time" field to a time after the upgrade is finished.

Disable Alarm Origination to INADS

1. Enter **change system-parameters maintenance** and press Enter.
2. Enter **n** in the *Alarm Origination* field and press Enter.
3. For some releases of system software, disable *Cleared Alarm Notification* and *Restart Notification* before submitting the form.

CAUTION:

Disabling alarm origination prevents the system from generating alarms, thus preventing unnecessary trouble tickets.

Save Announcements

1. If the system is equipped with a TN750/B Announcement circuit pack, enter **display announcements**, and press Enter. If administered recorded announcements are listed, enter **save announcements** [from PCSS] and

press Enter. Where P is the port network number (1 for PPN, and 2-4 for EPN), C is the carrier designation (A, B, C, or D), and SS is the number of the slot in which the circuit pack resides (01 to 21).

 **NOTE:**

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

 **NOTE:**

The TN750C Announcement circuit pack has on-board non-volatile storage and does not need to be saved to the translation card.

Shut Down DEFINITY LAN Gateway System

If a DEFINITY LAN Gateway system resides in the control cabinet to be upgraded, prepare to shut down the DEFINITY LAN Gateway assembly and allow the disk to completely spin down.

CAUTION:

Save the system parameters if you plan to reuse the current system.

CAUTION:

Neglecting to shut down a DEFINITY LAN Gateway assembly before powering down the system cabinet where it resides can damage the LAN Gateway disk.

1. Log onto the DEFINITY LAN Gateway. *See the DEFINITY Communications System Generic 3 Installation, Administration and Maintenance of CallVisor ASAI over the DEFINITY LAN Gateway, 555-230-223, for the procedure to log on.*
2. When the main menu appears, select *Maintenance*.
3. Select *Reset System* from the *Maintenance* menu.
4. Select *Shutdown* from the *Reset System* menu.
5. Unseat the LAN Gateway assembly from its backplane connectors.

Shut Down DEFINITY AUDIX System

1. If a DEFINITY AUDIX System resides in the control cabinet to be upgraded, shut down the AUDIX assembly and allow the disk to completely spin down.

WARNING:

Neglecting to shut down AUDIX before powering down the system cabinet where it resides can damage the AUDIX disk.

2. Unseat the AUDIX assembly from its backplane connectors in the carrier.

Power Down Basic Control Cabinet

CAUTION:

Powering down the PPN cabinet causes important system data, such as BCMS data, records of queued ACD calls, Automatic Wakeup request, and Do Not Disturb requests to be lost. Refer to DEFINITY Enterprise Communications Server Maintenance for R7 for information about preparing the system for a power down.

1. Set the basic control cabinet power supply circuit breaker to OFF.

Replace Circuit Packs

1. At the basic control cabinet, remove the combined TN786B/CPP1 Processor/Memory circuit pack.
2. Install the TN790 Processor circuit pack into the control cabinet slot labeled "PROCR."

Reseat DEFINITY LAN Gateway System

Reseat the LAN Gateway assembly into its backplane connectors.

Reseat DEFINITY AUDIX System

Reseat the AUDIX assembly into its backplane connectors.

Reboot the System

1. Set the basic control cabinet power supply circuit breaker to ON.
2. The system performs the reset level 4 rebooting process by loading translations from the translation card. This takes 8 to 11 minutes.
3. Peel the paper backing from the TN790 Processor circuit pack position label (designation strip) and affix it to the front of the control cabinet.
4. Install a circuit pack blank into the slot previously occupied by the CPP1.
5. Log in as "craft" at the login: prompt on the terminal.
6. Enter **set time**, and press Enter to set the time and ensure that the system is booted properly.

7. Enter **list configuration software-version**, and press Enter to compare the version number of the software release (displayed on the terminal) with the TN790 version number (written on a label on the TN790's faceplate). If the version numbers are not the same, change the version number on the TN790 label so that they agree.
8. Perform a sanity check on the system running the new software by executing the following commands in this order:
 - a. **status system 1** (to check out unusual status in the system)
 - b. **list station** (to ensure that the translation is read in properly)
 - c. **display alarm** (to ensure no alarm is raised in the system)
 - d. **list trunk-group** (to ensure the translation is read in properly)
 - e. **list hunt-group** (to ensure the translation is read in properly)

This ensures there is no translation corruption and the translations can be saved with the new software.

 **NOTE:**

If the new load must be returned to the previous software load, re-install the TN786B/CPP1 circuit packs and reboot with the previous version's translation card.

9. Get the DOSS order number of the upgrade, and call the regional CSA to request an "init" login and challenge response for Access Security Gateway feature.

 **NOTE:**

Certain forms have changed for DEFINITY ECS releases. Upgraded translations may appear on a different form, fields may shift within a form, and the name assignments to particular fields may change.

10. Notify the switch administrator that any previous login names and passwords still exist, but that the passwords expire in 24 hours. The new login names and passwords must conform to the requirements below.

 **NOTE:**

A password must have from 4 to 11 alphanumeric characters including at least 1 alphabetic character and 1 numeric character. A login name must have from 3 to 6 alphanumeric characters.

11. Since an R1V3.0 G3-MA cannot notify users about expiring passwords, disable password aging for any login name used with an R1V3.0 G3-MA.

Restart DEFINITY LAN Gateway System

1. Log onto the DEFINITY LAN Gateway.
2. When the main menu appears, select *Maintenance*.

3. Select *Reset System* from the *Maintenance* menu.
4. Select *Restart System* from the *Reset System* menu.

Save Upgraded Translations onto New Translation Card

1. Enter **status system 1**, and press Enter to verify the system is in “active” mode.
2. If the system contains a TN750/B Announcement circuit pack, check for completion of an automatic restore of announcements before removing the original translation card. If the system has been running for at least 45 minutes since power on, this operation should be complete. Check the yellow LED on the TN750/B which is lit during the download. If the restore did not start within 15 minutes of power on, enter **restore announcements**, and press Enter.
3. At this point, all telephones should be working properly.
4. Insert the new translation card. Verify the write switch is down.
5. The original translation card can be reformatted and reused. Enter **format card-mem announcements** and press Enter. This formats the original translation card even if no announcement circuit packs are installed.
6. Enter **save translation**, and press Enter. This instructs the system to write all translation information from memory onto the translation card.
7. If the system is equipped with a TN750/B Announcement circuit pack and announcements were restored in the above step, enter **save announcements [‘from’ cabinet(1-X). carrier (A-D), slot (0-20)]** and press Enter. Where cabinet/carrier/slot is the location of the TN750/B.

NOTE:

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

Enable TTI

If TTI was optioned prior to the software upgrade:

1. Enter **change system-parameters features** and press Enter.
2. Use page 2 of the form to change the TTI field back to *y*.

Enable Scheduled Maintenance

Enter **change system-parameters maintenance**, and press Enter. Enable the scheduled daily maintenance.

Enable Customer Options

1. Enter **change system-parameters customer-options**.
2. Use these forms to verify the customer options are properly set.

NOTE:

In the `Basic Call Setup` field, if `ISDN-PRI?` was set to `y` before the upgrade, be sure to set the field back to `y`.

Resolve Alarms

Examine the alarm log and resolve any alarms that may exist.

Verify Alarm Origination to INADS

Be sure the system is part of the existing INADS database by calling the INADS Database Administrator at the Technical Service Center (TSC). Verify that INADS can dial into the system and that the system can dial out to INADS. As part of the system registration process, the INADS Database Administrator enables Alarm Origination.

Return Equipment

Return the replaced equipment (including the old Translation Card) to Lucent Technologies according to the requirements outlined in the following documents:

*BCS/Material Logistics, MSL/Attended Stocking Locations
Methods and Procedures for Basic Material Returns*

High and Critical Reliability (Duplex) Systems

The upgrade procedure for high and critical reliability systems takes up to two hours. Service is interrupted for about five minutes. The procedure cannot be done remotely, and it must be performed at the PPN (local) terminal.

Ensure that the following items are available before proceeding:

1. Generic software card with the software release currently running in the system
2. Generic software card containing the new software to which upgrades are to be made
3. Translation cards on which to save system translations (these cards should already be in the system)
4. Software patch (if it exists) that is currently applied to the system (this patch is downloaded if a software backout is required)
5. Software release label to be applied to the processor circuit pack after a successful upgrade

The following table indicates the processes and their corresponding time allotment for the upgrade procedure.

Process	Time (minutes)
save translation	9
save announcement	45
upgrade software	15
save translation	9
miscellaneous	11
Total Time	90

[Figure 5-7](#) presents output that appears on the terminal during this procedure.

Figure 5-7. Terminal Display for a Duplex System Software Upgrade

Save Current Translations to Original Translation Card

1. Set the write switch on the original translation card down to record. Insert the card into the slot on the TN777B faceplate.

2. Enter **save translation** and press **Enter** to get translations onto the translation card. This takes about 5 minutes. The yellow LED on the TN777B is on. If the translations were corrupted, the following error message displays when logging in:

WARNING:

Translation corruption detected; call Lucent Technologies distributor immediately.

NOTE:

The **save translation** command cannot function if the translation corruption message appears.

Disable TTI

Enter **change system-parameters features** and press **Enter**. Use Page 2 of the form to disable Terminal Translation Initialization (TTI) by changing the value to **n**.

List Configuration Software Version

Issue the **list configuration software-versions** command to determine whether any patches have been applied.

NOTE:

If the system must be restored to the old software, download the correct patches back onto the system.

Disable Scheduled Maintenance

1. Enter **change system-parameters maintenance**, and press **Enter**. Use this form to prevent scheduled daily maintenance from interfering with the update or upgrade.

NOTE:

If scheduled maintenance has begun, set the value of the "Stop Time" field to one minute after the current time. If scheduled maintenance has not yet begun, change the value of the "Start Time" field to a time after the upgrade is finished.

Disable Alarm Origination to INADS

1. Enter **change system-parameters maintenance** and press **Enter**.
2. Enter **n** in the *Alarm Origination* field and press **Enter**.
3. For some releases of system software, disable *Cleared Alarm Notification* and *Restart Notification* before submitting the form.

CAUTION:

Disabling alarm origination prevents the system from generating alarms, thus preventing unnecessary trouble tickets.

Save Announcements

1. If the system is equipped with a TN750/B Announcement circuit pack, enter **display announcements**, and press Enter. If administered recorded announcements are listed, enter **save announcements** [from PCSS] and press Enter. Where P is the port network number (1 for PPN, and 2-4 for EPN), C is the carrier designation (A, B, C, or D), and SS is the number of the slot in which the circuit pack resides (01 to 21).

NOTE:

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

NOTE:

The TN750C Announcement circuit pack contains on-board non-volatile memory. It is not necessary to back up a TN750C.

Shut Down DEFINITY LAN Gateway System

If a DEFINITY LAN Gateway system resides in the control cabinet to be upgraded, prepare to shut down the DEFINITY LAN Gateway assembly and allow the disk to completely spin down.

CAUTION:

Save the system parameters if you plan to reuse the current system.

WARNING:

Neglecting to shut down a DEFINITY LAN Gateway assembly before powering down the system cabinet where it resides can damage the LAN Gateway disk.

1. Log onto the DEFINITY LAN Gateway. *See the DEFINITY Communications System Generic 3 Installation, Administration and Maintenance of CallVisor ASAI over the DEFINITY LAN Gateway, 555-230-223, for the procedure to log on.*
2. When the main menu appears, select *Maintenance*.
3. Select *Reset System* from the *Maintenance* menu.
4. Select *Shutdown* from the *Reset System* menu.
5. Unseat the LAN Gateway assembly from its backplane connectors.

Shut Down DEFINITY AUDIX System

1. If a DEFINITY AUDIX System resides in the control cabinet to be upgraded, shut down the AUDIX assembly and allow the disk to completely spin down.

WARNING:

Neglecting to shut down AUDIX before powering down the system cabinet where it resides can damage the AUDIX disk.

2. Manually Power Down AUDIX System

A yellow caution sticker on the system's power unit notifies technicians to shut down the DEFINITY AUDIX System prior to powering down the system.

- a. Using a pointed object, such as a paper clip or pen (do not use a pencil), press the Boot/shutdown button. The button is located at the top right portion of the front panel.
- b. Hold the boot/Shutdown button in until the LCD display flashes the message MSHUT.
- c. Release the Boot/Shutdown button.

NOTE:

The DEFINITY AUDIX System takes about five minutes to shut down. The "heartbeat" indication on the display continues to flash.

3. Unseat the AUDIX assembly from its backplane connectors in the carrier.

Power Down Basic Control Cabinet

CAUTION:

Do not power down the entire system. This defeats the purpose of high or critical reliability configurations.

CAUTION:

Powering down the control cabinet causes important system data, such as BCMS data, records of queued ACD calls, Automatic Wakeup request, and Do Not Disturb requests to be lost. Refer to DEFINITY Enterprise Communications Server Maintenance for si for information about preparing the system for a power down.

Set the basic control cabinet power supply circuit breaker to OFF.

Replace Circuit Packs

1. Remove the combined TN786B/ CPP1 Processor/Memory circuit pack from the basic control cabinet.
2. Install the TN790 Processor circuit pack into the control cabinet slot labeled "PROCR."

Reboot the System

1. Set the basic control cabinet power supply circuit breaker to ON.
2. The system performs the reset level 4 rebooting process by loading translations from the translation card. This takes 10 to 15 minutes.
3. Peel the paper backing from the new circuit pack position label (designation strip) and affix it to the front of the basic control cabinet.
4. Install a circuit pack blank into the slot previously occupied by the CPP1.

Power Down Duplicated Control Cabinet

CAUTION:

Do not power down the entire system. This defeats the purpose of high or critical reliability configurations.

Set the duplicated control cabinet power supply circuit breaker to OFF.

Replace Circuit Packs

1. Remove the combined TN786B/ CPP1 Processor/Memory circuit pack from the duplicated control cabinet.
2. Install the TN790 Processor circuit pack into the control cabinet slot labeled "PROCR."

Reseat DEFINITY LAN Gateway System

Reseat the LAN Gateway assembly into its backplane connectors in the carrier.

Reseat DEFINITY AUDIX System

Reseat the AUDIX assembly into its backplane connectors.

Reboot the System

1. Set the duplicated control cabinet power supply circuit breaker to ON.
2. The system performs the reset level 4 rebooting process by loading translations from the translation card. This takes 10 to 15 minutes.

3. Peel the paper backing from the new circuit pack position label (designation strip) and affix it to the front of the duplicated control cabinet.
4. Install a circuit pack blank into the slot previously occupied by the CPP1.
5. Log in as "craft" at the `login:` prompt on the management terminal.
6. Enter **set time**, and press `Enter` to set the time and ensure that the system is booted properly.
7. Enter **list configuration software-version**, and press `Enter` to compare the version number of the software release (displayed on the terminal) with the TN790 version number (written on a label on the TN790's faceplate). If the version numbers are not the same, change the version number on the TN790 label so that they agree.
8. Perform a sanity check on the system running the new software by executing the following commands in this order:
 - a. **status system 1** (to check out unusual status in the system)
 - b. **list station** (to ensure that the translation is read in properly)
 - c. **display alarm** (to ensure no alarm is raised in the system)
 - d. **list trunk-group** (to ensure the translation is read in properly)
 - e. **list hunt-group** (to ensure the translation is read in properly)

This ensures there is no translation corruption and the translations can be saved with the new software.

 **NOTE:**

If the new load must be returned to the previous software load, re-install the TN786B/CPP1 circuit packs and reboot with the previous version's translation card.

9. Get the DOSS order number of the upgrade, and call the regional CSA to request an "init" login. Once logged in as "init," the CSA should assign the DEFINITY ECS R5 option, which automatically sets the 24-hour password aging for the upgraded system's customer logins.

 **NOTE:**

Certain forms have changed for DEFINITY ECS R5. Upgraded translations may appear on a different form, fields may shift within a form, and the name assignments to particular fields may change.

10. Notify the switch administrator that any previous login names and passwords still exist, but that the passwords expire in 24 hours. The new login names and passwords must conform to the requirements below.

 **NOTE:**

A password must have from 4 to 11 alphanumeric characters including at least 1 alphabetic character and 1 numeric character. A login name must have from 3 to 6 alphanumeric characters.

11. Since an R1V3.0 G3-MA cannot notify users about expiring passwords, disable password aging for any login name used with an R1V3.0 G3-MA.

Restart DEFINITY LAN Gateway System

1. Log onto the DEFINITY LAN Gateway.
2. When the main menu appears, select *Maintenance*.
3. Select *Reset System* from the *Maintenance* menu.
4. Select *Restart System* from the *Reset System* menu.

Save Upgraded Translations onto New Translation Card

1. Enter **status system 1**, and press Enter to verify that the system is in the "active/standby" mode.

⇒ NOTE:

At this point, all telephones should be working properly.

2. Insert the new translation card. Verify the write switch is down.
3. The original translation card can be reformatted and reused. Enter **format card-mem announcements** and press Enter. This formats the original translation card even if no announcement circuit packs are installed.
4. Enter **save translation**, and press Enter. This instructs the system to write all translation information from memory onto both translation cards.
5. If the system is equipped with a TN750/B Announcement circuit pack and announcements were saved above, enter **restore announcements**, and press Enter. Once the administered recorded announcements are restored, enter **save announcements** [from PCSS] and press Enter. Where P is the port network number (1 for PPN, and 2-4 for EPN), C is the carrier designation (A, B, C, or D), and SS is the number of the slot in which the circuit pack resides (01 to 21).

⇒ NOTE:

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

⇒ NOTE:

The TN750C Announcement circuit pack has on-board non-volatile storage and does not need to be saved to the translation card.

Enable TTI

If TTI was enabled prior to the software upgrade:

1. Enter **change system-parameters features** and press Enter.
2. Use page 2 of the form to change the TTI field back to *y* (if necessary).

Enable Scheduled Maintenance

Enter **change system-parameters maintenance**, and press Enter. Use this form to enable scheduled daily maintenance.

Enable Customer Options

1. Enter **change system-parameters customer-options** and press Enter.
2. Use these forms to verify the customer options are properly set.

NOTE:

In the `Basic Call Setup` field, if `ISDN-PRI?` was set to *y* before the upgrade, be sure to set the field back to *y*.

Resolve Alarms

Examine the alarm log. Resolve any alarms that may exist using *DEFINITY Enterprise Communications Server Maintenance for si*.

Verify Alarm Origination to INADS

Be sure the system is part of the existing INADS database by calling the INADS Database Administrator at the Technical Service Center (TSC). Verify that INADS can dial into the system and that the system can dial out to INADS.

As part of the system registration process, the INADS Database Administrator enables Alarm Origination.

Return Equipment

Return the replaced equipment (including the old Translation Card) to Lucent Technologies according to the requirements outlined in the following documents:

BCS/Material Logistics, MSL/Attended Stocking Locations

Methods and Procedures for Basic Material Returns

5 Routine Maintenance Procedures
Preventive Maintenance Procedures

5-40

Preventive Maintenance Procedures

Preventive Maintenance Log

The DEFINITY Preventive Maintenance Log is shown on the next page. Post this Log on the customer premises near the switch. Whenever you complete any of the preventive maintenance procedures described in this section, be sure to fill in the requested information on the log form before leaving the customer's premises.

PREVENTIVE MAINTENANCE LOG
DEFINITY ECS (R5 and later)

Date equipment installed: _____

Air Filters¹	Scheduled Date	Date Completed	Completed By
Single-carrier cabinet			
Multi-carrier cabinet			

Scheduled Date	Date Completed	Completed By

Battery Packs²	Scheduled Date	Date Completed	Completed By
Single-carrier cabinet			
Multi-carrier cabinet			

Scheduled Date	Date Completed	Completed By

- 1 Inspect annually; clean or replace. See ["Air Filters"](#) below.
- 2 Replace every 4 years. See ["Batteries"](#) below.

Post this form with the equipment.

Air Filters

Air filters should be inspected annually. If a filter is dirty or clogged, first tap it on the ground. If the filter is still dirty or clogged, then wash it with warm water and a mild detergent. A vacuum cleaner can be used if one is available. If there is no facility for washing or vacuuming the air filter, then replace the filter. Refer to [“CABINET \(Cabinet Sensors\)”](#) maintenance object for more information on air filters and fans.

Batteries

The batteries should be replaced every four years or whenever a POWER alarm occurs in the system.

Tape Head/Capstan

If the system contains a tape backup, the tape drive head (also called the tape head) should be cleaned at least once a year. Moreover, it should be cleaned as part of the preventive maintenance strategy. Because new tapes leave more abrasive particles on the tape head than used tapes, it is recommended that you inspect the tape head during each maintenance visit and that you clean the tape head several times a year. In addition, a dated label should be placed on the tape drive unit after the tape head is cleaned.

The tape head can be accessed for cleaning from the front of the drive by opening the tape access door with your finger. Refer to TAPE Maintenance documentation for more details on cleaning the tape head.

System Features

In addition to the various maintenance and test commands (described in [Chapter 8, “Maintenance Commands and Trouble-Clearing Aids”](#)) that are available, the following system features may also be useful in troubleshooting certain system resources:

- Automatic Circuit Assurance (ACA)
- Busy Verification of Terminals and Trunks
- Trunk Group Busy/Warning Indicators to Attendant
- Trunk Identification by Attendant
- Facility Test Calls
- Analog Tie Trunk Back-to-Back Testing
- Terminating Trunk Transmission Testing
- Troubleshooting ISDN-PRI Problems
- Troubleshooting PRI Endpoint Problems
- Troubleshooting ISDN-PRI Test Calls

Complete descriptions of each feature are provided in the *DEFINITY Enterprise Communications Server Administration and Feature Description*.

Refer to *DEFINITY Communications System Generic 1 and Generic 3 — Console Operations*, 555-230-700, and *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations* as required for detailed operating procedures (does not include Facility Test Calls, Analog Tie Trunk Back-to-Back Testing, Terminating Trunk Transmission Testing, Troubleshooting ISDN-PRI Problems, Troubleshooting ISDN-PRI Test Calls, or Troubleshooting ISDN-BRI Problems described in this chapter.)

Automatic Circuit Assurance

Requires the use of a display-equipped voice terminal (may be nondisplay type if the Voice Message Retrieval feature is provided) or an attendant console. An "ACA activate/deactivate" button (one per system) is required on the voice terminal or attendant console.

Automatic Circuit Assurance (ACA) assists users in identifying possible trunk malfunctions. The system maintains a record of the performance of individual trunks relative to short and long holding time calls. The system automatically initiates a referral call to an attendant console or display-equipped voice terminal when a possible failure is detected.

Holding time is the elapsed time from when a trunk is accessed to the time a trunk is released. When ACA is enabled via administration, the system measures the holding time of each call.

A short holding time limit and a long holding time limit are preset by the System Manager for each trunk group. The short holding time limit can be from 0 to 160 seconds. The long holding time limit can be from 0 to 10 hours. The measured holding time for each call is compared to the preset limits for the trunk group being used.

Measurements are not made on personal CO lines, out-of-service trunks, or trunks undergoing maintenance testing.

Busy Verification of Terminals and Trunks

Requires the use of a multi-appearance voice terminal or attendant console equipped with a "verify" button.

Busy Verification of Terminals and Trunks allows a user at a voice terminal or attendant console to make test calls to trunks, voice terminals, and hunt groups (DDC/UCD). These test calls check the status of an apparently busy resource. This provides an easy method to distinguish between a voice terminal or resource that is truly busy and one that only appears busy because of a trouble condition.

Trunk Group Busy/Warning Indicators to Attendant

Requires the use of an attendant console.

Trunk Group Busy/Warning Indicators to Attendant provides the console user with a visual indication of the trunk group status for each trunk group associated with the 12 Trunk Group Select buttons located on the console. Trunk groups with busy indications during nonbusy periods should be checked to ensure that the trunks are busy and not out-of-service. Use the Busy Verification of Terminals and Trunks feature to test the suspected faulty trunks.

Trunk Identification by Attendant

Requires the use of a display-equipped voice terminal or an attendant console equipped with a "trunk id" button.

Trunk Identification by Attendant allows a voice terminal or attendant console user to identify a specific trunk being used on a call. This is useful when a user experiences noise or poor transmission on a trunk call. The trunk identification (access code and group number) is displayed when the "trunk id" button is pressed while on a trunk call. Use of this feature is denied if there are more than two trunks on a call. If the call is trunk-to-trunk, the identification displayed is of the last trunk added to the call.

Facility test calls

The Facility Test Calls feature provides a voice terminal user the capability of placing test calls to access specific trunks, touch-tone (DTMF) receivers, time slots, and system tones. The test call can be made by a local voice terminal user by dialing an access code.

⇒ NOTE:

For the ISDN-PRI Test Call feature, see ["Troubleshooting ISDN-PRI Test Call Problems"](#) later in this chapter.

⇒ NOTE:

The following test call descriptions are for voice terminal users:

Trunk test call

The trunk test call accesses specific Tie or CO trunks. DID trunks cannot be accessed.

⇒ NOTE:

Do not use this trunk test call procedure to test ISDN-PRI or ATM-CES trunks. For more information on testing ISDN-PRI or ATM-CES trunks, see ATM-BCH, Test #258.

To place a call:

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

 **NOTE:**

The Facility Test Call Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example. For more information on FAC, refer to *DEFINITY Communications System Generic 3 Implementation*, 555-230-653.

2. Dial the 6-digit port number "PCSSpp"

P = Port network number (1 for PPN or 2 or 3 for EPN)
C = Carrier number (A=1, B=2, C=3, D=4, E=5)
SS = Slot number (01—20)
pp = Port number

The channels on a DS1 trunk are addressed by using the channel number for the port number.

3. Listen for one of the following tones:
 - Dial Tone or Silence—trunk is connected. Go to Step 4. If you hear a dial tone, it is coming from the far end. If the far end has been disabled, you do not hear dial tone. However, depending on far-end administration, you may still be able to dial digits. All digits dialed after the port number are transmitted using end-to-end DTMF signaling; therefore, if the trunk being tested is a rotary trunk, it is not possible to break dial tone.
 - Reorder Tone—trunk is busy or maintenance busy.
 - Intercept Tone— a trunk or touch-tone (DTMF) receiver has not been accessed.
4. Place a call. Even if you do not hear a dial tone, you may still be able to dial digits, depending on the administration of the far-end switch.

All digits dialed after the port number are transmitted using end-to-end DTMF signaling; therefore, if the trunk being tested is a rotary trunk, it will not be possible to break dial tone.

If the call does not go through (that is, no ringing), determine if the trunk circuit pack has been removed.

Touch-tone (DTMF) Receiver Test Call

The touch-tone (DTMF) receiver call accesses and tests the four touch-tone (DTMF) receivers located on the Tone Detector circuit pack. **To place the call:**

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

NOTE:

The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial the 6-digit port number "PCSSpp":

P = Part network number (1 for PPN or 2 or 3 for EPN)

C = Carrier number (A=1, B=2, C=3, D=4, E=5)

SS = Slot number (01—20)

pp = Touch-tone (DTMF) Receiver Port number (01, 02, 05, or 06)

3. Listen for one of the following tones:

- Confirmation Tone—touch-tone (DTMF) receiver is connected. Go to Step 4.
- Reorder Tone—touch-tone (DTMF) receiver is busy.
- Intercept Tone—a touch-tone (DTMF) receiver or trunk has not been accessed.

4. Dial **1234567890*#** and listen for Confirmation tone (test passed) or intercept tone (test failed). The test fails if the touch-tone (DTMF) receiver does not recognize all the touch-tone (DTMF) signals.
5. To test another touch-tone (DTMF) receiver, repeat Steps 2 through 4.
6. To terminate the test call, hang up the station set used for testing.

Time Slot Test Call

The time slot test call connects the voice terminal user to a specific time slot located on the TDM Buses (A or B) or out-of-service time slots. **Specific Time Slots To place the call:**

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

NOTE:

The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then press # and the 3-digit time slot number "xxx," where:

xxx = Time slot number (000 through 255 on Bus A and 256 through 511 on Bus B)

3. Listen for one of the following tones:
 - Confirmation Tone—time slot is idle or maintenance busy
 - Reorder Tone—time slot is busy
 - Dedicated Tone—One of the following tones is heard (see [Table 5-3](#))

Table 5-3. TDM Bus Time Slot Numbers

TDM Bus A time slot	TDM Bus B time slot	Tone Heard
000	256	Reorder
001	257	Reorder
002	258	Reorder
003	259	Reorder
004	260	Reorder
005	261	Touch Tone 1 - 697Hz
006	262	Touch Tone 2 - 770 Hz
007	263	Touch Tone 3 - 852Hz
008	264	Touch Tone 4 - 941 Hz
009	265	Touch Tone 5 - 1209 Hz
010	266	Touch Tone 6 - 1336Hz
011	267	Touch Tone 7 - 1447 Hz
012	268	Touch Tone 8 - 1633 Hz
013	269	Dial Tone
014	270	Reorder Tone
015	271	Alert Tone
016	272	Busy Tone
017	273	Ringback Tone
018	274	Special Ringback Tone
019	275	2225 Hz Tone
020	276	Music
021	277	Tone on Hold
022-253	278-509	Confirmation (used for calls)
254	510	Reorder
255	511	Confirmation

Out-of-Service Time Slots To place the call:

1. Dial the Facility Test Call Feature Access Code (for instance, 197, see Note), and listen for dial tone.

⇒ NOTE:

The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then dial ** and listen for the following tones:
 - Confirmation Tone—Connection is made. Go to Step 3.
 - Reorder Tone—No time slots are out-of-service.
3. Repeat from Step 1 to alternate between out-of-service time slots on TDM Bus A and B.

System Tone Test Call

The system tone test call connects the voice terminal user to a specific system tone. **To place the call:**

1. Dial the Facility Test Call Feature Access Code (for instance, 197, see Note), and listen for dial tone.

⇒ NOTE:

The Facility Test Call Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then dial * followed by the two-digit tone identification number listed in [Table 5-4](#).
3. Listen for the tone that was specified.

⇒ NOTE:

For a definition of Call Progress Tones see *DEFINITY Enterprise Communications Server System Description*.

Analog Tie Trunk Back-to-Back Testing

The TN760B circuit pack can be configured for back-to-back testing (also known as connectivity testing) by making translation and cross-connect changes. This testing configuration allows for the connection of Tie Trunks back-to-back in the same switch to verify the operation of Tie Trunk ports. The tests can be performed in either the E & M or simplex modes.

E & M Mode Test Procedure

The procedures to perform the Analog Tie Trunk port test in the E & M mode are as follows:

1. At the administration terminal, enter **list configuration trunks** command to determine which ports are assigned on the Tie Trunk circuit pack.
2. Enter **display dialplan** command to determine the Trunk Access Code (TAC) format.
3. Enter **display port xx** command for all ports defined in Step 1. This action displays the trunk groups to which the ports belong (that is, of which the ports are members).

**NOTE:**

See the [“Handling Control Circuit Packs”](#) section in this chapter for details on how to remove and replace port circuit packs.

4. Insert the circuit pack back into the slot.

5. Enter **display trunk xx p** command for each trunk group identified in Step 3. This command displays the specified trunk group on the administration terminal screen and prints a hard copy on the printer. Save this data for later use.
6. Remove all members defined by these ports from the trunk group(s) using the **ch trunk xx** command.
7. Remove the Tie Trunk circuit pack from the carrier slot.
8. Set the dip (option) switches for each of the two ports to be tested on the Tie Trunk circuit pack to "E & M mode" and "unprotected."
9. Enter **add trunk n** command to add a new (test) trunk group. Then enter the following information:
 - Group Type — tie
 - TAC — (use trunk access code obtained from dial plan)
 - Trunk Type (in/out) — wink/wink
 - Port — assign two of the ports from the tie trunk
 - Mode — E & M
 - Type — specify one port as t1 standard and other port as t1 compatible

Examples of the Trunk Group forms are shown in [Screen 5-3](#) and [Screen 5-4](#).

Screen 5-4. Trunk Group Form — E & M Mode (Page 2 of 2)

10. Locate the Tie Trunk port terminal connections at the cross-connect field. See [Table 5-5](#).
11. At the cross-connect field, disconnect outside trunk facilities from the Tie Trunk ports and mark the disconnected wires for later reconnecting the Tie Trunk ports back to normal operation. The D Impact Tool (AT-8762) is required to perform this step.
12. Use jumper wires (DT 24M-Y/BL/R/G and DT 24P-W/BRN) and the D Impact Tool to connect wiring between the two ports assigned in Step 9 at the cross-connect field. For example, if the two ports on the Analog Tie Trunk circuit pack are port 1 and 2, connect the wirings as shown below:

13. Check all wirings to verify good connections between the two test ports.
14. Place a call from one voice terminal to another voice terminal using the Tie Trunk ports assigned. Dial TAC and extension. For example, if TAC of Tie Trunk group is 110 and station number is 5012, then dial 110 5012. If the call cannot be made, either one of these ports could be defective. There are four ports on TN760B (port 1, 2, 3, and 4), try different combinations to determine defective ports.
15. If there is a defective port on the circuit pack, try to switch to an unused port. However, if all ports are normally used, then replace the circuit pack.
16. Disconnect the jumpers between two ports. Then use administration terminal and trunk printouts to restore all trunk group changes to normal values.

Simplex Mode Test Procedure

The procedures to perform the Analog Tie Trunk Port Test in the simplex mode are as follows:

1. Repeat Steps 1 through 7 of the E & M Mode Test Procedure.
2. Set the dip (option) switches for each of the two ports to be tested on the Tie Trunk circuit pack to simplex mode.
3. Enter **add trunk n** command to add a new (test) trunk group. Then enter the following information:
 - Group Type — tie
 - TAC — (use trunk access code obtained from dial plan)
 - Trunk Type (in/out) — wink/wink
 - Port — assign two of the ports from the tie trunk
 - Mode — simplex
 - Type — type 5

An example of the Trunk Group Form Page 2 is shown in [Screen 5-5](#).

Screen 5-5. Trunk Group Form — Simplex Mode (Page 2 of 5)

4. Locate the Tie Trunk port terminal connections at the cross-connect field. See [Table 5-5](#).
5. At the cross-connect field, disconnect outside trunk facilities from the Analog Tie Trunk ports and mark the disconnected wires for later when the Tie Trunk ports are placed back into normal operation. The D Impact Tool (AT-8762) is required to perform this step.
6. Use jumper wires (DT 24M-Y/BL/R/G) and the D Impact Tool to connect wiring between the two ports assigned in Step 4 at the cross-connect field. For example, if the two ports on the Analog Tie Trunk circuit pack are ports 1 and 2, connect the wirings as shown below:

7. Repeat Steps 13 through 16 of the E & M Mode Test Procedure.

Terminating Trunk Transmission Testing

The Terminating Trunk Transmission (TTT) (noninteractive) feature provides for extension number access to three tone sequences that can be used for trunk transmission testing from the far end of the trunks.

The three test types should have extension numbers assigned on the Maintenance-Related System Parameters Form.

Test Type 100:_____ Test Type 102:_____ Test Type 105:_____

Test Type 100 provides:

1. 5.5 seconds of 1004 Hz tone at 0dB
2. Quiet until disconnect; disconnect is forced after one minute

Test Type 102 provides:

1. 9 seconds of 1004 Hz tone at 0dB
2. 1 second of quiet
3. This cycle is repeated until disconnect; disconnect is forced after 24 hours.

Test Type 105 provides:

1. nine seconds of 1004 Hz at -16dB
2. one second of quiet
3. nine seconds of 404 Hz at -16dB
4. one second of quiet
5. nine seconds of 2804 Hz at -16dB
6. 30 seconds of quiet
7. one half second of Test Progress Tone (2225 Hz)
8. approximately five seconds of quiet
9. forced disconnect

Troubleshooting ISDN-PRI Problems

The following flowchart, [Figure 5-8](#) and [Figure 5-9](#), defines a layered approach when troubleshooting ISDN-PRI problems. Since a problem at a lower layer affects upper layers, layers are investigated from low to high. In the flowchart, the DS1 facility is layer 1, the TN765 Processor Interface is layer 2, and the ISDN trunks are layer 3. Transient problems are diagnosed on Page 2 of the flowchart, [Figure 5-9](#).

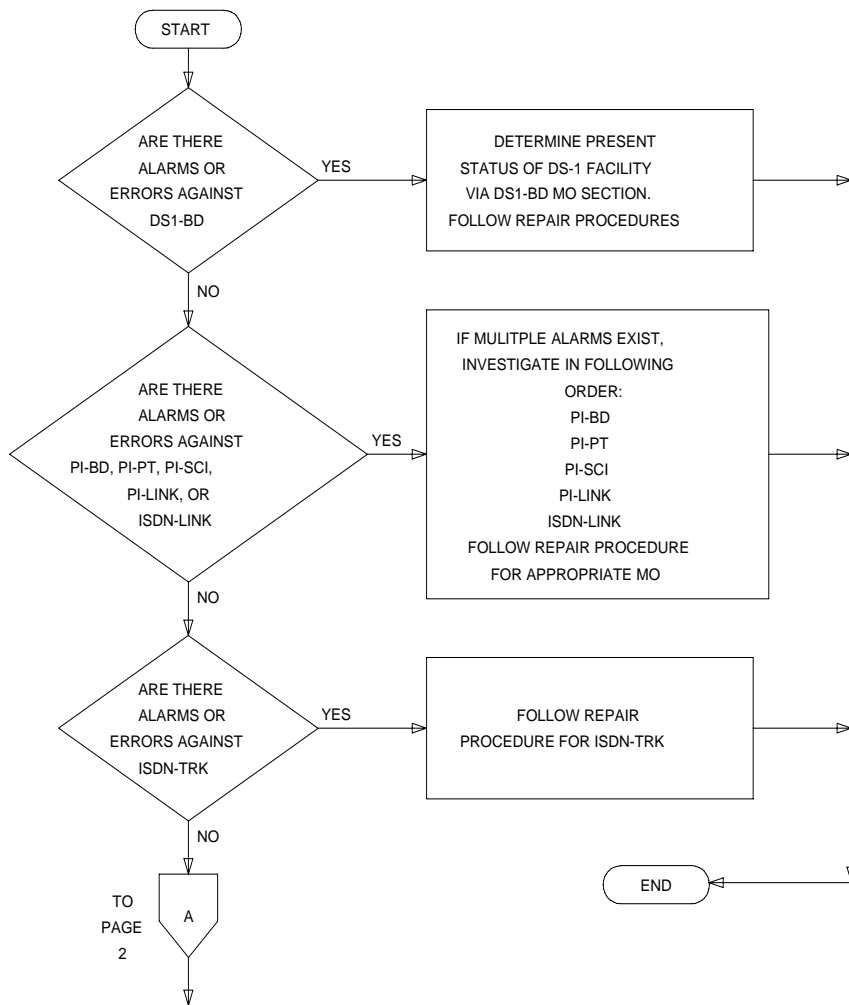

Figure 5-8. Processing of ISDN-PRI Problems (Page 1 of 2)

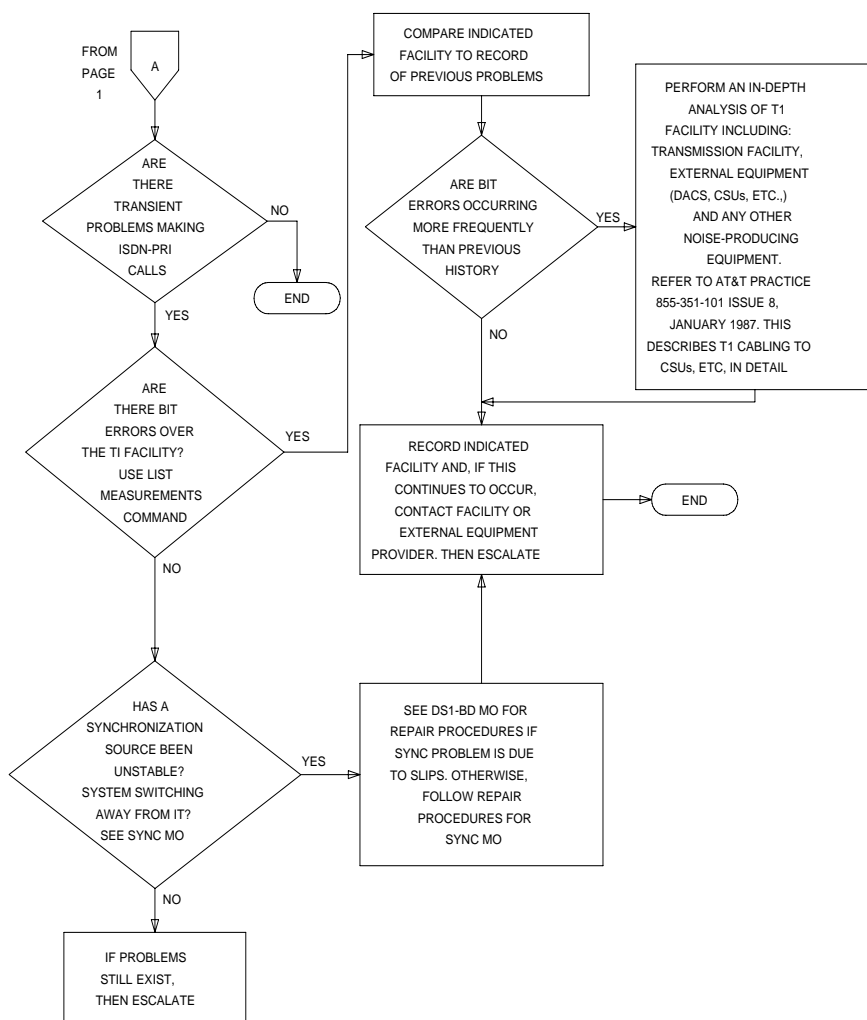

Figure 5-9. Processing of ISDN-PRI Problems (Page 2 of 2)

Troubleshooting PRI Endpoint Problems

The following flowchart, [Figure 5-10](#) and [Figure 5-11](#), defines a layered approach when troubleshooting PRI endpoint problems. Since a problem at a lower layer affects upper layers, layers are investigated from low to high. In the flowchart, the DS1 facility is layer 1, the TN765 Processor Interface is layer 2, and the ISDN trunks are layer 3.

The troubleshooting procedure described here diagnoses faults between the switch and the line-side PRI terminal adapter/ISDN-PRI endpoint equipment. Problems encountered on the network-side of a wideband connection or problems with end-to-end equipment compatibility are out of the scope of this section.

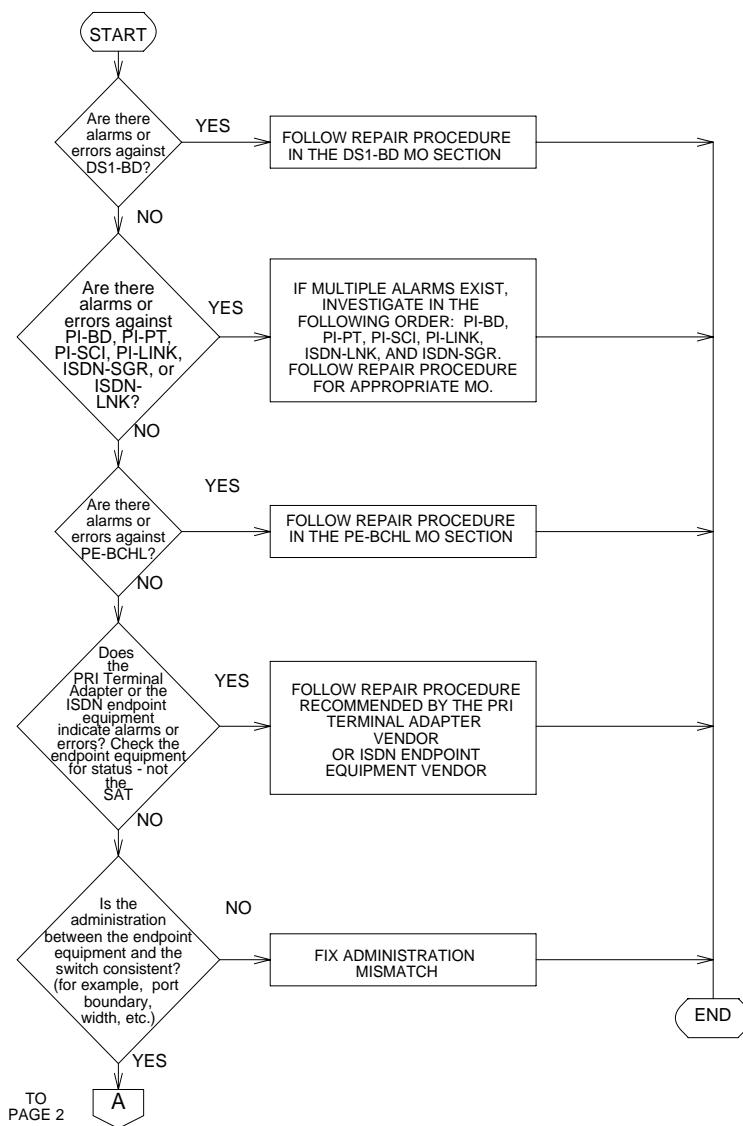

Figure 5-10. Processing of PRI Endpoint Problems (Page 1 of 2)

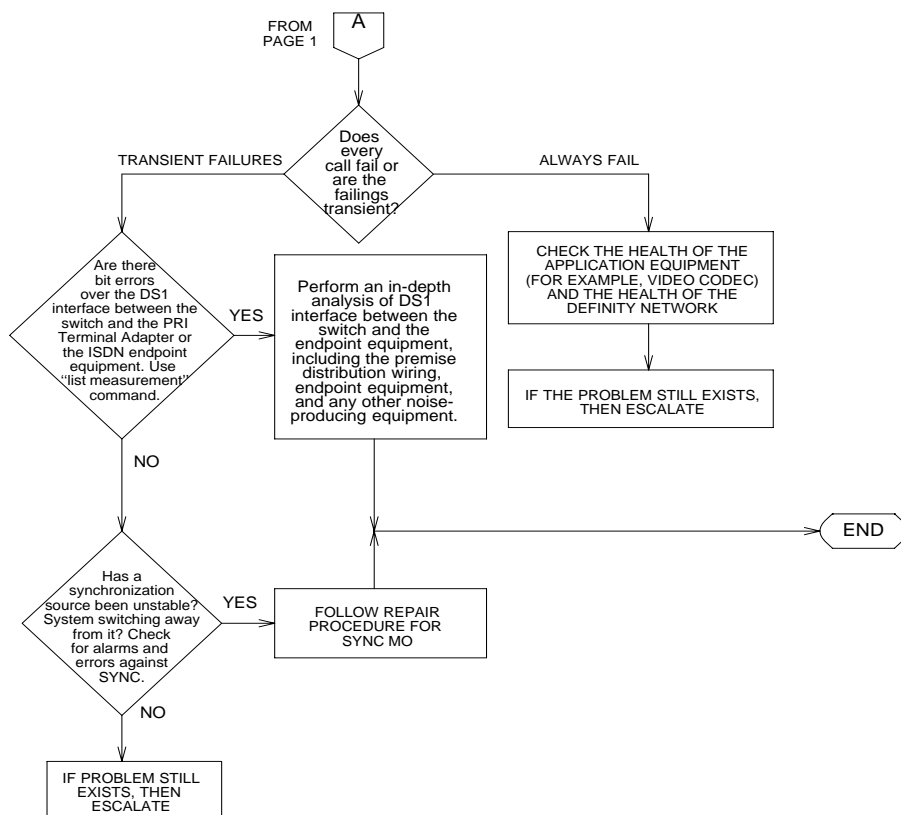

Figure 5-11. Processing of PRI Endpoint Problems (Page 2 of 2)

Troubleshooting ISDN-PRI Test Call Problems

An ISDN-PRI test call is a call of a diagnostic nature that is placed across an ISDN-PRI user-network interface to a previously designated number. An ISDN-PRI test call is also a maintenance procedure concerned with the identification and verification ISDN-PRI user-network interface problems. The ISDN-PRI test call can access ISDN-PRI trunks only.

Placing an Outgoing ISDN-PRI Test Call

⇒ NOTE:

An ISDN-PRI test call can be placed only if the circuit translates to an ISDN-PRI trunk.

An ISDN-PRI test call can be originated via either the *synchronous* or the *asynchronous* method. Each method is described below.

Synchronous Method

One command is used in this method to start, stop and query an ISDN-PRI test call. In the synchronous method, an outgoing ISDN-PRI test call may be part of a system technician-demanded long test sequence to test a circuit pack, port, or trunk. Therefore, the command line entry can be any of the following:

test trunk <grp>/<mbr> long [repeat #]

test port PCSSpp long [repeat #]

test board PCSS long [repeat #]

The "long" qualifier must be entered in the above commands in order for the ISDN test call to run. The repeat number (#) can be any number from 1 through 99 (default = 1).

The following information is displayed in response to the above commands:

- **Port:** The port address (PCSSpp) is the port network number, carrier designation, slot, and circuit of the maintenance object under test.
- **Maintenance Name:** The type of maintenance object tested.
- **Test Number:** The actual test that was run.
- **Test Results:** Indicates whether the test passes, fails, or aborts.
- **Error Code:** Additional information about the results of the test. (See the ISDN Trunk Maintenance documentation for details.)

Asynchronous Method

⇒ NOTE:

The asynchronous method requires a Maintenance/Test circuit pack to be physically present in the system.

In this method, four commands are used to start, stop, query, and list an outgoing ISDN-PRI test call. These commands are as follows:

clear isdn-testcall <grp>/<mbr> (stop)

list isdn-testcall (list)

status isdn-testcall <grp>/<mbr> (query)

test isdn-testcall <grp>/<mbr> [minutes] (start)

⇒ NOTE:

Before placing an outgoing ISDN-PRI test call, verify that the FAC on the System Features Form has been administered as well as the Far End Test Line No and TestCall Bearer Capability Class (BCC) on the Trunk Group Administration Form. Furthermore, if the ISDN-PRI trunk is of the "cbc" (call

by call) service type, then the Testcall Service field on Trunk Group Administration Form must have been administered also.

To initiate an outgoing ISDN-PRI test call in the asynchronous method, issue the following command:

test isdn-testcall <grp>/<mbr> [minutes]

This command enables you to specify a specific the trunk on which to originate the ISDN-PRI test call.

⇒ NOTE:

The optional qualifier can also be used that specifies in minutes the duration of the test call. If no duration is specified, the default duration is used which is 8.4 or 9.6 seconds. The qualifier "minutes" accepts the numeric values one through 120 (that is, two hours = 120 minutes).

[Screen 5-6](#) shows a typical response to the **test isdn-testcall** command:

```
test isdn-testcall
```

Port	Maintenance Name	Test Number	Test Result	Error Code
1B1501	ISDN-TRK	258	PASS	

Screen 5-6. Typical Response to Test ISDN-Testcall Command

The meaning of the information displayed in response to the above command is described in the following list.

- **Port:** The port address (PCSSpp) is the port network number, carrier designation, slot, and circuit of the maintenance object under test.
- **Maintenance Name:** The type of maintenance object tested.
- **Test Number:** The actual test that was run.
- **Test Results:** Indicates whether the test passes, fails, or aborts.
- **Error Code:** Additional information about the results of the test. (See the ISDN Trunk Maintenance documentation for details.)

The functions of the **clear**, **list**, and **status** commands associated with the ISDN Testcall are summarized in the following list. For more detailed information, refer to the appropriate sections as directed.

- **Clear isdn-testcall <grp>/<mbr>** enables you to cancel an in-progress ISDN-PRI test call and allow another test call to start. For details on this command, refer to the **clear isdn-testcall** command description in the "Clear Commands" section of [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).
- **List isdn-testcall <grp>/<mbr>** enables you to list all the ISDN-PRI trunks in use for an ISDN-PRI test call in the system. For details on this command, refer to the **list isdn-testcall** command description in the "List Commands" section of [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).
- **Status isdn-testcall <grp>/<mbr no> [minutes]** enables you to check on the progress of an outgoing test call. When an outgoing ISDN-PRI test call completes in a specific port network, another ISDN-PRI trunk from the same port network is available for testing (regardless of whether the **status** information has been displayed). For details on this command, refer to the **status isdn-testcall** command description in the "Status Commands" section of [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

Troubleshooting the Outgoing ISDN-Testcall Command

If the TestCall BCC field appears on the Trunk Group Administration Form, make sure the TestCall BCC field indicates the correct BCC for the service provisioned on the ISDN-PRI trunk. The TestCall BCC values are defined as follows:

- 0—Voice
- 1—Digital Communications Protocol Mode 1
- 2—Mode 2 Asynchronous
- 3—Mode 3 Circuit
- 4—Digital Communications Protocol Mode 0 (which is usually the default).

⇒ NOTE:

If the ISDN-PRI trunk is of type "cbc," make sure the TestCall Service field on the Trunk Group Administration Form indicates the correct service so that a network facility message can be sent across the ISDN-PRI network

If the outgoing ISDN-PRI test call keeps aborting, please make sure that the far-end device can handle DCP Mode 0 or DCP Mode 1.

⇒ NOTE:

Before attempting to make an ISDN-PRI test call to the public network (that is, the network is the far-end), make sure that test call service is provisioned by the network. The user must subscribe to Test Type 108 service and have the correct far-end test call number administered on the trunk group form for the call to be allowed.

Troubleshooting Backplane Voltage Problems

The TN2036 Voltage Range circuit pack is a test tool that allows easy access to the backplane pins that provide various voltages to control and port slots. Probes from a voltmeter can be plugged into the access point for the desired voltage and a ground access point to measure the voltage. This circuit pack itself has instructions for use printed on the side as well as a listing of the voltage tolerance range for each voltage on the front panel. The voltages and tolerances are as follows:

ringing voltage: 75 -> 115 VAC

+12 VDC: 11.4 -> 12.6 VDC

+5 VDC: 4.95 -> 5.35 VDC

-5 VDC: -4.95 -> -5.35 VDC

-48 VDC: -43 -> -53 VDC

neon message waiting voltage: -80 VDC -> -165 VDC

The type of cabinet determines where the circuit is placed to measure the voltages. For single-carrier cabinets, all voltages except +12 VDC and +5 VDC can be measured from any port slot. However, the neon message waiting voltage requires that the system have a TN752 or TN755 Power Unit circuit pack. The Tape Drive slot is used to measure +12 VDC.

NOTE:

All control circuit packs should be removed from the backplane before this measurement is made.

The +5 VDC measurement must be made in two separate cabinet locations since the power unit has two independent +5 VDC outputs [+5 VDC and +5(B) VDC]. Each output supplies a different section of the cabinet with power. For the control cabinet, make one measurement in the processor slot and another in any port slot. For an EPN control cabinet, make one measurement in any port slot from 1 to 4 and another in any port slot from 5 to 16. For a port cabinet, make 1 measurement in any port slot from 1 to 6 and another in any port slot from 7 to 18.

Multimedia Call Handling (MMCH)

Expansion Services Module

The Expansion Services Module (ESM) shown in [Figure 5-12](#) provides T.120 data sharing capability on a MMCH multipoint H.320 video conference. Each conference participant must have endpoints administered and a personal computer with the H.320 video application installed. The DEFINITY ECS must have the expansion service module installed.

Figure 5-12. Typical ESM connections

Figure Notes

|---|--|
| <ol style="list-style-type: none"> 1. Port B Y-cable connector to a TN787 Multimedia Interface (MMI) circuit pack 2. Port A Y-cable connector to a TN2207 PRI circuit pack 3. 25-pair Y-cable 4. 356A adapter | <ol style="list-style-type: none"> 5. D8W cord connected to 356A adapter port 1 6. Expansion Service Module (ESM) 7. Port B on compatible primary rate interface (PRI) card |
|---|--|

CAUTION:

The TN2207 circuit pack is the only pack allowing connection of an ESM to the DEFINITY ECS switch.

Troubleshooting MMCH

Before troubleshooting any problems associated with the DEFINITY MMCH, always be sure that the endpoint is operating correctly (audio, video, and data) by making point-to-point test calls. If possible, make the test calls over the network to test the connectivity and routing of network calls from the endpoint. This eliminates problems such as disconnected audio or video cables and network troubles.

64 Kbps Calls Terminate but Far End Receives 56 Kbps Indication

Description

Some 2x64 Kbps conferences on the DEFINITY MMCH do not establish because of framing, audio, or video problems.

For calls that are routed in the network through a Lucent Technologies/LEC interface, the originating equipment may launch a 64 Kbps call attempt, and the far end receives either a 56 Kbps or 64 Kbps indication. If the far end receives a 64 Kbps indication, the call may have used 56 Kbps facilities. If so, the call may exhibit any of the following conditions:

- No handshaking in one direction or both (call disconnects after timeouts)
- Call connects, but audio or video is corrupted (audio noise or no video)
- Call succeeds without disruption (this is the least likely since one endpoint must be aware that the call is really 56 Kbps to connect)

If any of the above conditions occur, then 64 Kbps calls from the site are blocked.

Solution

Administer the conference for connection at 56 Kbps.

Calls Terminate with No Audio

Description

To support endpoints that do not support Multipoint Command Conference (MCC), the DEFINITY MMCH changes its capability set and initiates a capability set exchange with the endpoint when the Selected Communications Mode (SCM) changes. If the endpoint does not follow the SCM audio mode, the MCU may include the endpoint as a secondary (audio only) endpoint. If the endpoint sends an unknown or unsupported audio mode, then the TN788B decoder port mutes the endpoint from the conference. The user may hear the conference but may not be heard by other parties in the conference.

Solution

1. Use the Status Conference x form and check the Audio Mode field for the current operating mode of the conference.
2. Another indication of the audio modes is in the "Incoming Mode Commands from Endpoint and Outgoing Commands from MMI" on page 3 of the Status Conference x Endpoint y form. Check the `Audio` fields under the Mode Commands/Communication Modes section of the form.

Some Parties Cannot Be Heard by Others (Audio Subsetting)

Description

Problems where varying subsets of the conference hear different things may have problems with the various summing resources/groups that are in use. Traditionally these faults are caused by the SPE not cleaning up the connections properly. Isolation and diagnosis should focus on the VC resources in use by that conference.

Solution

1. Use the **status conference** command to list the VC resources in use by this conference. Try a hot replacement of any VC boards in use, which refreshes the VC translations and move all of the audio connections to different VC ports.
2. If the problem still exists, try dropping the conference and then bringing the conference back up again. Not only does this refresh VC translations, but uses different timeslots as well.
3. If the problem still exists, suspect a hardware problem. If practical, wait for the DEFINITY MMCH to be idle (no active conferences), and then check the circuit packs for active (yellow) LEDs. If any of these are unexpected, such as on a VC board, try replacing the board and then bringing the conference up again.

Calls Terminate with No Video

Description

Generally, loss of video can be divided into 2 types. The first occurs when the DEFINITY MMCH switches to the endpoint, but nobody sees them. The receivers see either "black" video or a frozen image of the previous speaker depending on the codec of the manufacturer. The type occurs when the DEFINITY MMCH does not switch to an endpoint.

Solution

In the first type described above, wiring problems, power to the camera, or video encoder circuit pack problems in the codec are typical causes.

In the second type, no video from an endpoint typically occurs because it is not a valid video source. This can be checked by looking at page 1 of the Status Conference x Endpoint y Vid form under the Capability section. In this section, a "y" or "c" suggests that the endpoint has video. An "e" means ept has not declared any video capability in cap set, "n" is audio only, and "blank" means audio add-on.

Also check page 1 of the Status Conference x Endpoint y Vs form for indication of the video state for the endpoint values.

Calls Terminate Correctly but Are Unstable

Description

A number of conditions will lead to some or all endpoints having stability problems during the course of a conference. A lack of stability from an endpoint is noticeable by a lack of a video switching while the party is the only talker or excessive disconnects from that endpoint.

Synchronization

Generally, the most common problem is a mismatch in synchronization sources between the endpoint and the DEFINITY MMCH. This typically causes low-level (Px64) handshake problems that can trigger the endpoint/MMCH to disconnect the call. The MMCH's timers are set to sufficiently high values so that, normally, the endpoint will timeout and disconnect first. If installed in a customer network, it is a good idea to perform an audit of the path synchronization is being supplied. If there are different clock sources between endpoints and the DEFINITY MMCH, some problems are sure to occur. The severity of these problems can range from a handshake failure every few seconds to one per day. Depending on the type of endpoint, this can cause the endpoint to disconnect or just freeze video until the main problem is resolved.

Specifically, PictureTel System 4000 endpoints seem to be the most sensitive to instability. The Lucent Technologies Vistium also disconnects fairly infrequently. Last, the CLI Rembrandt II VP freezes video and waits for framing to be recovered.

Network Configuration Concerns with Synchronization

When auditing a network for synchronization, avoid unnecessary hops. Thus, a switch providing star-configuration synchronization is preferred over a daisy-chain configuration. Additionally, if there are DEFINITY PBXs that have EPNs, synchronization should be provided to sub nodes from the same port network through which the PBX receives its synchronization. Passing synchronization through the PBX Expansion Interface adds an unnecessary hop to the path and creates another potential point of failure.

Expansion Interface Duplication

If a customer's network uses PBX EPNs with duplicated Expansion Interfaces, scheduled switching of the Expansion Interface links should be disabled on the PBX via **change system-parameters maintenance**. When scheduled maintenance runs and switches the links, there is a brief corruption of the data path. If endpoints have active calls when the switch occurs, this corruption of the

data path causes Px64 handshake problems, which lead to the endpoints losing video source status, and sometimes disconnecting as described above. Disabling the EI switching is in the customer's best interest to prevent the disruption of the Px64 data stream. The customer will get the same level of alarm indications and maintenance on the EI links, regardless of the status of scheduled switching.

PRI D-Channel Backup

A somewhat unlikely source of call stability problems occur where the translations for PRI D-channel Backup between two non-MCU switches were incorrect. As an example, on switch A, DS1 1A10 was designated as the primary source, and on switch B, the corresponding DS1 was designated as the secondary source. When scheduled maintenance was run on the switch that had an active standby D-channel, an audit disconnected some calls using the link. The problem was corrected when the the D-channel primary/secondary assignments matched.

Processor Duplication on the PBX

Do not enable the PI link switch on scheduled maintenance. This can cause link stability problems on the Accunet Bandwidth Controller (ABC).

Voice-Activated Switching Problems

Voice-activated switching on the DEFINITY MMCH does not follow the loudest talker. The MMCH queues all speaking parties and selects a new video broadcaster (the second-oldest speaking party) when the oldest speaking party has stopped talking. The new broadcaster will see the last speaker as its video. The system can also "learn" about the noise coming from an endpoint to help prevent false switches, adapting both to noise level and repetitive sounds such as a fan. This adaptation occurs over approximately 10 seconds.

No Switching, Full Motion Video

If a room is excessively noisy, the DEFINITY MMCH may receive sufficient audio signal to conclude that there is a speaker present. Use the Status Conference x form to determine if the MMCH thinks an endpoint is talking. The MMCH sets the T_s field to t for each endpoint if there is voice energy detected. This endpoint may have to mute when nobody at the site is speaking to allow the conference to proceed normally. Remind the customer that it may be necessary to mute if a side conversation is going on in the background, just as one would do in an audio conference. If the system does not switch broadcasters even after the current broadcaster has muted, check the conference administration using the **display conference X** command to ensure that the conference is in voice-activated mode. Also verify that parties who were speaking are valid video sources as described in the "[Calls Terminate with No Video](#)" section above.

The See-Me feature (MCV) can also cause VAS to “lock-up.” An endpoint can activate MCV to force their site to become the broadcaster. If they do not disable the feature when finished, the system remains in this mode indefinitely. The **status conference X** command shows that MCV is in effect by displaying `av` in the Video Status (Vs) column. Page 3 of the Status Conference X Endpoint Y form also has a `Broadcaster` field that indicates MCV is in effect with (SEE-ME) as the broadcaster. The same scenario can occur in a CHAIR or UCC-controlled conference with a designated broadcaster. In this situation the CHAIR/UCC has not released the designated broadcaster and returned to VAS mode. If there is a UCC-designated broadcaster, **status conference X** indicates a Video Status of `u`. Also, for UCC rollcall the return video may appear to be stuck. Check the Video Status for an “R,” indicating rollcall.

If none of the examples above appears to be the cause, and if the room was quiet, all speakers are valid video sources, the conference is voice-activated, and the speaker can be heard, then escalate the problem.

Video Never Switches to a Particular Party

Description

Verify that the endpoint is a valid video source as described in the “[Calls Terminate with No Video](#)” section above. If it is, then the audio from the endpoint may not have sufficient voice signal for the hardware to determine the parties at the endpoint are speaking. Check the `Talk` field on page three of the Status Conference X Endpoint Y form to see if the `talking bit is y`. Next, check the audio by standing adjacent to the microphone and speaking at a normal level.

Solution

If the audio is not muffled:

1. Use the **status conference** command to determine which port on the TN788B (VC board) is connected to this endpoint.
2. Check the VC (TN788B) board using the **test board xxyy long** command.
3. Drop the call.
4. Find another available port, then:
 - a. Busyout the port to which the endpoint was connected.
 - b. Make another call to the same conference. If the problem corrects itself, then the previous port may be bad. If there are other VC boards with sufficient available ports to replace calls on the current VC, then pull the board that has the bad endpoint on it (the **status conference** command displays the encoder port associated with the call). The system will automatically reestablish the VC connections without dropping the call. If this fixes the problem, then

replace the board, as it has at least one bad port. Reseating the board may temporarily fix the problem due to the hard reset done to the board.

Audio Echo

Echo in conference calls, particularly those with large delay characteristics, is totally disruptive. When Voice Activated Switching is taken into account, the effects are disastrous. Various arrangements of the microphone(s) and room speaker(s) may be needed.

For some Lucent Technologies Vistium endpoints, if an external speaker is attached or was attached when the system was last rebooted, this endpoint will cause audio echo throughout the conference. First, isolate the offending endpoint by asking each endpoint to mute, one at a time, until the echo disappears.

If the input from an endpoint is located too close to the speakers of an endpoint, then acoustic echo is created. The microphone must be moved away from the speakers.

Normally, if any microphone in the room is moved relative to the speakers, that site will cause echo until the echo canceller in the codec retrains itself, some will require a manual reset. If a PictureTel keypad is configured with external microphones connected to the keypad, then the internal microphone and external microphone(s) "sing" to each other if the "ext mic" bat switch is set to "int mic" on the back of the keypad. In this configuration, VAS locked on that site, and the acoustic "singing" was inaudible.

Rate Adaptation

Because of a lack of a clear explanation in standards, sometimes endpoints do not work well with each other and the DEFINITY MMCH. The MMCH will only allow a conference to downgrade from 64kbps to 56 kbps operation on conferences that have the `Rate Adaptation` flag set to `y`.

When a downgrade does occur, information on the Status Conference form indicates the success or failure of the 64kbps-endpoints that are participants to properly rate adapt to 56kbps. As a general indication that the conference has rate adapted, the `Conference Transfer Rate` and `Effective Transfer Rate` fields show initial and current transfer rates, respectively. For each 64-kbps endpoint the column that indicates `Rate Adapt` shows an `n` if the endpoint did not follow the procedures as specified by the H.221. If an endpoint shows `y`, it did successfully rate adapt. If an endpoint shows `c`, it joined the conference at 56kbps.

5 Routine Maintenance Procedures

Install DS1 CPE Loopback Jack (T1 Only)

5-75

Once the conference rate adapts, the endpoints that do not properly follow suit, will become audio-only endpoints. A conference will not rate adapt from 56 kbps back to 64 kbps until all endpoints disconnect from the conference and it idles.

The PictureTel 1000 Release 1.1C, PictureTel 6.01 software, and the Vistium 2.0 software successfully rate adapt with the MCU. External rate adaptation techniques used by VTEL and CLI are known to cause problems with the endpoint when used with this feature.

Endpoint or I-MUX in Loopback Mode

Some endpoints have a loopback enable feature. This makes DEFINITY MMCH data loopback at the MMCH when a connection is in progress. The loopback can be enabled prior to or during a connection.

The MMCH does not detect the loop and continues to VAS. In most scenarios, the switch occurs, but within a few seconds, the broadcaster's return video becomes its own image. Once the broadcaster stops speaking, the system "false" switches to an apparently random port that was not speaking.

Install DS1 CPE Loopback Jack (T1 Only)

Using the DS1 CPE Loopback Jack (apparatus code 700A, comcode 107988867), a technician can test the DS1 span between the system and the network interface point. The loopback jack is required when DC power appears at the interface to the ICSU. *The loopback jack isolates the ICSU from the DC power and properly loops the DC span power.*

NOTE:

The loopback jack operates with any vintage of TN767E (or later) or TN464F (or later) DS1 circuit packs and with G3V3 EDI Release 3 (or later) software. The loopback jack operates with the 120A2 (or later) Integrated Channel Service Unit (ICSU) only; *not* the 31xx series of Channel Service Units or other external CSUs or earlier ICSUs.

Loopback Jack Installation

Configurations Using a Smart Jack

The preferred location of the loopback jack is at the interface to the Smart Jack. This provides maximum coverage of CPE wiring when remote tests are run using the loopback jack. If the Smart Jack is not accessible, install the loopback jack at the extended demarcation point.

5 Routine Maintenance Procedures

Install DS1 CPE Loopback Jack (T1 Only)

5-76

1. If there is no extended demarcation point, install the loopback jack directly at the network interface point as shown in [Figure 5-13](#).
2. If there is an extended demarcation point and the Smart Jack is not accessible, install the loopback jack as shown in [Figure 5-14](#).
3. If there is an extended demarcation point, but the Smart Jack is accessible, install the loopback jack as shown in [Figure 5-15](#).

Configurations Without a Smart Jack

1. Install the loopback jack at the point where the cabling from the ICSU plugs into the “dumb” block. If there is more than one “dumb” block, choose the one that is closest to the Interface Termination feed or the fiber MUX. This provides maximum coverage for loopback jack tests. Refer to [Figure 5-16](#) and [Figure 5-17](#).

Installation

1. To install the loopback jack, simply disconnect the RJ-48 (8-wide) connector (typically an H600-383 cable) at the appropriate interface point and connect the loopback jack in series with the DS1 span. See [Figure 5-13](#) through [Figure 5-17](#).
2. Plug the H600-383 cable from the ICSU into the female connector on the loopback jack.
3. Plug the male connector on the loopback jack cable into the network interface point.

NOTE:

Do not remove the loopback jack after installation. This is not a test tool and should always be available to remotely test a DS1 span.

Administration

1. At the management terminal, enter **change ds1 <location>**. The “location” is the DS1 interface circuit pack for which the loopback jack was installed.
2. Be sure the “near-end CSU type” is set to `integrated`.
3. On page 2 of the form, change the `supply CPE loopback jack power` field to `y`.

NOTE:

Setting this field to `y` informs the technician that a loopback jack is present on the facility. This allows a technician to determine that the facility is available for remote testing.

4. Enter **save translation** to save the new information.

DS1 Span Test

This test should only be performed after the DS1 circuit pack and the 120A2 (or later) ICSU have been successfully tested using appropriate maintenance procedures. The DS1 span test consists of 2 sequential parts. Each part provides a result indicating if there is a problem in the CPE wiring. CPE wiring may be considered problem-free only if the results of both parts are successful.

The first part of the span test powers-up the loopback jack and attempts to send a simple code from the DS1 board, through the wiring and loopback jack, and back to the DS1 board. Maintenance software waits about 10 seconds for the loopback jack to loop, sends the indication of the test results to the management terminal, and proceeds to the second part of the test.

The second part of the test sends the standard DS1 3-in-24 stress testing pattern from the DS1 board, through the loopback jack, and back to a bit error detector and counter on the DS1 board. The bit error rate counter may be examined at will via the management terminal, and provides the results of the second part of the test. The test remains in this state until it is terminated so that the CPE wiring may be bit error rate tested for as long as desired.

1. Busy out the DS1 circuit pack by entering **busyout board UUCCSS** (where UUCCSS is the cabinet, carrier, and slot number of the DS1 board).
2. At the management terminal, enter **change ds1 <location>** and verify the `near-end csu type` is set to `integrated`.
3. Change to page 2 of the DS1 administration form and confirm that the TX LBO field is 0dB. If not, record the current value and change it to 0dB for testing. Press `Enter` to implement the changes or press `Cancel` to change nothing.
4. Enter **test ds1-loop <location> cpe-loopback-jack**. This turns on simplex power to the loopback jack and waits about 20 seconds for any active DS1 facility alarms to clear. A "PASS" or "FAIL" displays on the terminal. This is the first of the 2 results. A "FAIL" indicates a fault is present in the wiring between the ICSU and the loopback jack. The loopback jack may also be faulty. A "PASS" only indicates that the loopback jack looped successfully, not that the test data contains no errors. If a "PASS" is obtained, continue with the following steps.

NOTE:

The loss of signal (LOS) alarm (demand test #138) is not processed during this test while the 3-in-24 pattern is active.

5. Enter **clear meas ds1 loop <location>** to clear the bit error count.
6. Enter **clear meas ds1 log <location>** to clear the performance measurement counts.
7. Enter **clear meas ds1 esf <location>** to clear the ESF error count.

8. Enter **list meas ds1 sum <location>** to display the bit error count. Refer to [Table 5-6](#) for troubleshooting information.

Table 5-6. DS1 Span Troubleshooting

Displayed Field	Function	Indication
Test: cpe-loopback-jack	Pattern 3-in-24	The loopback jack test is active.
Synchronized	Y or N	If "y" displays, the DS1 circuit pack has synchronized to the looped 3-in-24 pattern and is accumulating a count of the bit errors detected in the pattern until the test has ended. If "n" displays, retry the test 5 times by ending the test per Step 11 and re-starting the test per Step 4. If the circuit pack never synchronizes, substantial bit errors in the 3-in-24 pattern are likely. This could be intermittent connections or a broken wire in a receive or transmit pair in the CPE wiring.
Bit Error Count	Cumulative count of detected errors	<p>If there are no wiring problems, the counter remains at 0.</p> <p>A count that pegs at 65535 or continues to increment by several hundred to several thousand on each list meas command execution indicates intermittent or corroded connections, severe crosstalk, or impedance imbalances between the two conductors of the receive pair or the transmit pair. Wiring may need replacement.</p> <p>Note that "ESF error events" counter and the ESF performance counter summaries ("errored seconds", "bursty errored seconds", and so forth) will also increment. These counters are not used with the loopback jack tests. However, they will increment if errors are occurring. Counters should be cleared following the test.</p>

9. Repeat Steps 5 through 8 as desired to observe bit error rate characteristics. Also, wait 1 to 10 minutes between Steps 5 through 7. One minute without errors translates to better than a 1 in 10 to the eighth error rate. Ten minutes without errors translates to better than a 1 in 10 to the ninth error rate.
10. If the test runs for 1 minute with an error count of 0, confirm that the 3-in-24 pattern error detector is operating properly by entering **test ds1-loop <location> inject-single-bit-error**. This causes the 3-in-24 pattern generator on the DS1 circuit pack to inject a single-bit error into the transmit pattern. A subsequent **list meas ds1 summary <location>** command displays the bit error count. If a count greater than 1 is displayed, replace the ICSU and retest. If the problem continues, replace the DS1 circuit pack.

5 Routine Maintenance Procedures

Install DS1 CPE Loopback Jack (T1 Only)

5-79

11. Terminate the test by entering **test ds1-loop <location> end cpe-loopback-jack-test**. Wait about 30 seconds for the DS1 to re-frame on the incoming signal and clear DS1 facility alarms.

Loopback termination fails under the following conditions:

- a. The span is still looped somewhere. This could be at the loopback jack, at the ICSU, or somewhere in the network. This state is indicated by a fail code of 1313. If the red LED on the loopback jack is on, replace the ICSU. Re-run the test and verify that the loopback test terminates properly. If not, replace the DS1 circuit pack and repeat the test.
 - b. The DS1 cannot frame on the incoming span's signal after the loopback jack is powered down. This means that there is something wrong with the receive signal into the loopback jack from the "dumb" block or the Smart Jack. If the service provider successfully looped and tested the span, up to the Smart Jack, this condition isolates the problem to the wiring between the loopback jack and the Smart Jack. Refer to "Loopback Jack Fault Isolation Procedures" for information on how to proceed in this case. The test cannot be successfully terminated until a good signal is received. To properly terminate the test before a good receive signal is available, enter **reset board <location>**.
12. Restore the "TX LBO" field to the original value recorded in Step 2.
 13. Release the DS1 circuit pack using the **release board UCCSSpp** command.
 14. Leave the loopback jack connected to the DS1 span.

Loopback Jack Fault Isolation Procedures

This section describes the possible DS1 configurations in which the loopback jack may be used. These configurations are: when the DS1 provider includes a Smart Jack, when no Smart Jack is provided at all, and when sites use fiber multiplexers. These configurations are separated into "Configurations Using a Smart Jack" and "Configurations Without a Smart Jack."

Configurations Using a Smart Jack

The addition of the loopback jack and the presence of a Smart Jack divides the DS1 span into 3 separate sections for fault isolation. These sections are shown in [Figure 5-13](#) through [Figure 5-15](#) for the different span configurations. They are:

- Section 1: Between the 120A2 (or later) ICSU and the loopback jack.
- Section 2: Between the loopback jack and the Smart Jack (network interface point).
- Section 3: From the Smart Jack to the CO. It is necessary to contact the DS1 provider to run this test.

5 Routine Maintenance Procedures

Install DS1 CPE Loopback Jack (T1 Only)

5-80

A problem can exist in 1 or more of the 3 sections. The field technician is responsible for finding and correcting problems in the first 2 sections. The DS1 service provider is responsible for finding and correcting problems in the third section. Testing is divided into 3 steps.

- Test customer premises wiring (section 1 in the following 3 figures) from the ICSU to the loopback jack as described in “DS1 Span Test.”
- Test the CO-to-network interface wiring (section 3 in [Figure 5-13](#)) using the Smart Jack loopback (CO responsibility). Coordinate this test with the DS1 provider.
- Test the short length of customer premises wiring (section 2 in the following 3 figures) between the loopback jack and the Smart Jack. This can be done using a loopback that “overlaps” section 2 of the cable. Any of the following loopbacks can do this:
 - a. The local ICSUs line loopback, which is typically activated, tested, and then deactivated by the DS1 service provider at the CO end.
 - b. The local DS1 interface’s payload loopback, activated and tested by the DS1 service provider at the CO end.
 - c. The far-end ICSU’s line loopback. This test is activated at the management terminal by entering **test ds1-loop <location> far-csu-loopback-test-begin**. The test is terminated by entering **test ds1-loop <location> end-loopback/span-test**. Bit error counts are examined as described in “DS1 Span Test.” This test method is the least preferable because it covers wiring that is not in the local portion of the span. This test only isolates problems to section 2 wiring if there are no problems in the wiring between the far-end CO and the far-end ICSU. Coordinate this test with the DS1 service provider.

If any of the above tests (a, b, or c) fail, a problem is indicated in section 2 as long as the tests for section 1 and section 3 pass. Since section 2 includes the network interface point, it is necessary to work with the service provider to isolate the fault to the loopback jack cable, the “dumb” block, or the Smart Jack.

Section 2 includes the short cable from the loopback jack to the "dumb" block demarcation point (part of the loopback jack). This is the only portion of section 2 that is part of customer premises wiring but is not covered in the loopback jack's loopback path.

A problem can exist in 1 or both of the 2 sections. The field technician is responsible for finding and correcting problems in section 1 and the loopback cable portion of section 2. The DS1 service provider is responsible for finding and correcting problems in the majority of section 2. Testing is divided into 2 steps.

5 Routine Maintenance Procedures

Install DS1 CPE Loopback Jack (T1 Only)

5-86

1. Test customer premises wiring (section 1 in [Figure 5-16](#)) from the ICSU to the loopback jack as described in the “DS1 Span Test” section.
2. Test the loopback jack-to-”dumb” block and ”dumb” block-to-CO wiring (section 2 in [Figure 5-16](#)). This can be done using a loopback that “overlaps” the section of the span. Any of the following loopbacks can do this:
 - a. The local ICSUs line loopback, which is typically activated, tested, and then deactivated by the DS1 service provider at the CO end.
 - b. The local DS1 interface’s payload loopback, activated and tested by the DS1 service provider at the CO end.
 - c. The far-end ICSU’s line loopback. This test is activated at the management terminal by entering **test ds1-loop <location> far-csu-loopback-test-begin**. The test is terminated by entering **test ds1-loop <location> end-loopback/span-test**. Bit error counts are examined as described in the “DS1 Span Test” section. This test only isolates problems to section 2 wiring if there are no problems in the wiring between the far-end CO and the far-end ICSU. Coordinate this test with the DS1 service provider.

If any of the above tests (a, b, or c) fail, a problem is indicated in section 2. This could mean bad loopback jack -to-”dumb” block cabling, but is more likely to indicate a problem somewhere between the “dumb” block and the CO. This is the responsibility of the DS1 service provider. If the DS1 Span Test confirms that there are no problems in section 1, the technician should proceed as follows to avoid unnecessary dispatch.

- Identify and contact the DS1 service provider
- Inform the DS1 provider that loopback tests of the CPE wiring to the “dumb” block (section 1) showed no problems
- If the far-end ICSU line loopback test failed, inform the DS1 provider
- Request that the DS1 provider perform a loopback test of their portion of the section 2 wiring by sending someone out to loop section 2 back to the CO at the “dumb” block.

If this test fails, the problem is in the service provider’s wiring.

If the test passes, the problem is in the cable between the loopback jack and the “dumb” block. Replace the loopback jack.

Configurations Using Fiber Multiplexers

Use the loopback jack when customer premises DS1 wiring connects to an on-site fiber multiplexer (MUX) and allows wiring to the network interface point on the MUX to be remotely tested. This requires that ICSUs be used on DS1 wiring to the MUX.

Fiber MUXes can take the place of Interface termination feeds as shown in [Figure 5-13](#), [Figure 5-14](#), [Figure 5-15](#), and [Figure 5-16](#). Test these spans using the same procedures as metallic spans. Note the following points:

1. Fiber MUXes may have loopback capabilities that can be activated by the service provider from the CO end. These may loop the signal back to the CO or back to the DS1 board. If the MUX provides the equivalent of a line loopback on the "problem" DS1 facility, this may be activated following a successful loopback jack test and used to isolate problems to the wiring between the loopback jack and the MUX.
2. Be aware that there are installations that use repeatered metallic lines between the MUX and the "dumb" block. These lines require DC power for the repeaters and this DC power is present at the "dumb" block interface to the CPE equipment. *A loopback jack is required in this configuration to properly isolate and terminate the DC power.*

To check for the presence of DC, make the following 4 measurements at the network interface jack:

1. From Transmit Tip (T, Pin 5) to Receive Tip (T1, Pin 2)
2. From Transmit Ring (R, Pin 4) to Receive Ring (R1, Pin 4)
3. From Transmit Tip (T, Pin 5) to Transmit Ring (R, Pin 4)
4. From Receive Tip (T1, Pin 2) to Receive Ring (R1, Pin 4)

All measurements should read 0 (zero) volts DC. For pin numbers and pin designations, refer to *Integrated Channel Service Unit (ICSU) Installation and Operation*, 555-230-193.

Operating Characteristics

If a TN464F or TN767E and a 120A2 were installed in a system running pre-G3V3 software and the software is later upgraded to G3V3 Release 3 or later, reseal the DS1 circuit pack so that the ICSU administration fields will appear on the DS1 administration form.

ATM Tips

This section provides tips for DEFINITY ATM PNC when interfacing with the Cajun A500 ATM switch.

Initial LED inspection

Visually inspect the LEDs on both the TN230X ([Table 5-7](#)) and the ATM switch ([Table 5-8](#)) for a high-level status of the system.

Table 5-7. TN230X LED reference

LED color			Interpretation
Red	Green	Yellow	
Off	Off	Steady on	Normal state for active ATM EI board on PPN.
Off	Off	Off	Normal state for standby ATM EI board on PPN and EPN.
Off	Off	2 sec on / 2 sec off	Normal state for active PNC archangel ATM EI board on EPN.
-	-	100ms on / 100ms off	Loss of signal on the OC-3 fiber. Either the TN230X-receive (top) or TN230X-transmit (bottom) fibers are not working.
N/S	Fast blink	-	Running DSP diagnostics or downloading code to DSPs (typical during boot process).
-	Slow blink	-	Board insertion has not yet completed.
-	Steady on	-	Running maintenance tests. May appear to be blinking if several short tests are run one after another.
Steady on	-	-	Hardware alarm. Does not necessarily take the TN230X out of service, for example, if one of the 24 DSPs fails diagnostics.

[Table 5-8](#) shows the various LEDs on the A500 ATM switch and the meanings of the different states.

Table 5-8. A500 LED Quick Reference

Component	Label	Color	State	Meaning
Switch Processor Board	LK	Green	Intermittent blink	Normal state. Traffic is being sent or received over the Ethernet LAN link.
	RX	Green	Steady on	Normal state. Carrier is received over the Ethernet LAN link.
	DIAG	Green	Off	Normal state.

Continued on next page

Table 5-8. A500 LED Quick Reference — Continued

Component	Label	Color	State	Meaning
	NBOOT	Green	Off	Normal state.
	MGT	Green	Off	Normal state.
	RUN	Green	Steady on	Normal state. The switch processor is running.
	PWR	Green	Steady on	Normal state. The switch processor board is powered up.
	VOLT	Yellow	Off	Normal state
	TEMP	Yellow	Off	Normal state
	FAN	Yellow	Off	Normal state
	SYSERR	Yellow	Off	Normal state
	FAULT	Yellow	Off	Normal state
Switch Fabric Board	PWR	Green	Steady on	Normal state. The switch fabric board is powered up.
	FAULT	Yellow	Off	Normal state
Port Board	PWR	Green	Steady on	Normal state. The port board is powered up.
	FAULT	Yellow	Off	Normal state
Port Board Per Port	RX	Green	Off	No ATM cells are being received. This is not a normal state if the terminating port network is supposed to be up and running.
	RX	Green	Intermittent blink	ATM cells are being received intermittently. This is a typical pattern for DEFINITY if only Variable Bit Rate (VBR) signaling connections are present but no talk paths are up, perhaps because no calls are in progress.
	RX	Green	Steady on	ATM cells are being received frequently enough that the LED is lit constantly. This is a typical pattern for DEFINITY if Constant Bit Rate (CBR) talk paths are present.
	CD	Green	Off	Loss of carrier on the fiber. The A500 detects only if the A500-receive (right-hand) fiber is not working. The state of the A500-transmit (left hand) fiber is not detected.
	CD	Green	Steady on	Normal state. There is an optical carrier detected on the fiber from the TN230X.

Continued on next page

Table 5-8. A500 LED Quick Reference — Continued

Component	Label	Color	State	Meaning
	RPRD	Yellow	Off	Normal state
Power Supply	AC OK	Green	Steady on	Normal state. AC power is okay.
	DC OK	Green	Steady on	Normal state. DC power is okay.

Cajun A500 Diagnostics

The first step in any diagnostic procedure involving the A500 is to identify the OC-3 ports on the A500 that have DEFINITY port networks attached.

- Be aware that customers may use other ports on the A500 for applications unrelated to DEFINITY (LAN traffic or multimedia applications, for examples).
- These other applications may manifest themselves in the output of the troubleshooting commands you run on the A500. DEFINITY port networks must be identified by their A500 port numbers.

**NOTE:**

The following examples show DEFINITY port networks connected to A500 ports A1.1 and A1.2.

Has the A500 been installed and configured correctly?

Diagnostics

- Is the A500 powered up?
- If you are administering the A500 through a locally-attached console, is there a local console terminal connected to the console port on the A500 switch processor board with the correctly-pinned RS232 serial cable?
- If you are administering the A500 through telnet over the Ethernet, is there an 10BaseT Ethernet drop plugged into the Ethernet port on the A500 switch processor board? (Note that a few A500 commands are only permitted over the local console terminal.)
- Has the A500 been booted using either the recessed reset button or by turning the power off, then on again?
- Did the A500 go through a normal power up sequence, including testing all of the LEDs?
- Are any A500 yellow fault LEDs lit?

- Are the remaining A500 LEDs in a normal state ([Table 5-8](#) above)?
- Can you log into the A500 console using the diagnostic account **root** from the local console terminal or through telnet? (See [Figure 5-18](#) below.)

```

Figure 5-19. A500 screen output for status command

- a. If the customer is providing an Ethernet connection to the A500, does the `Ethernet IP address` field have the customer-provided Internet address (configured using the **admin address** command)?

If you are administering the A500 through a telnet connection over the Ethernet, this works, but it is worthwhile making sure the Ethernet address is correct anyway.

- b. If the customer is providing an Ethernet connection to the A500, does the `Ethernet IP mask` field have the customer-provided mask (typically something like `255.255.255.0`, although other values are valid), as configured with the **admin address** command?
- c. If the customer is providing an Ethernet connection to the A500, does the `IP default router` field have the customer-provided Internet address, as configured using the **admin gateway** command?
- d. If the customer is providing an Ethernet connection to the A500 and intends to upload to or download from a TFTP server, does the `TFTP server` field have the customer-provided Internet address, as configured using the **tftp setserver** command?
- e. Does the `ATM address` field have the customer- or Lucent-provided network prefix (the first thirteen bytes and set by using the **modify atmprefix** command)?

DEFINITY Administration

Is ATM PNC administered correctly?

1. Enter **list atm pnc** on the DEFINITY SAT. The cabinet, carrier and slot positions of each administered TN230X board display as shown in [Figure 5-20](#). Ensure that each board's physical location matches the display.

```
list atm pnc                                     Page 1   SPE A
          ATM PNC
PNC      A-PNC      B-PNC
Connection #  LOC          LOC
 1         01B02
 2         02A01
```

Figure 5-20. Screen output for **list atm pnc** command

Alternatively, use the **list configuration UUC** command (non-control cabinets) to confirm the PPN and EPN board locations and correct insertion.

2. Enter **status pnc** at the DEFINITY SAT. This display tells you which TN230X board is active in a duplicated system and how many alarms (if any) of each severity level have been logged for the board. [Figure 5-21](#) shows the output from this command.

```
status pnc

                                PORT NETWORK CONNECTIVITY

                                Duplicated? no
                                Software Locked?
                                Standby Busied?

                                Standby Refreshed?
                                Interchange Disabled?

                                A-PNC                                B-PNC

Warning Alarms: 0                              Warning Alarms:
```

Figure 5-21. Screen output for status pnc command

3. Enter either **list configuration UUC** (for the carrier in which the ATM-EI packs reside) or **display circuit-packs cabinet** (non-control cabinet) at the DEFINITY SAT. This command tells you in more detail what boards are in which slots in each cabinet and carrier. Verify that the TN230Xs are physically located in the slots indicated on the display. [Figure 5-22](#) shows the output for the **display circuit-packs 1** command; [Figure 5-23](#) shows the output for the **display circuit-packs 2** command.

```
display circuit-packs 1

```

Figure 5-23. Screen output for display circuit-packs 2

4. Enter **display atm pnc portnetwork** on the DEFINITY SAT.

This display tells you the ATM addresses that have been administered for each TN230X. Verify that each ATM address (the concatenation of the five displayed hexadecimal fields) is correct and match those administered in the A500. See [“A500 Administration”](#) for more information.

Administered with hard coded PNNI routes

If the port networks are addressed using *hard coded PNNI routes* in the A500, the display looks like [Figure 5-24](#) (pnc 1) and [Figure 5-25](#) (pnc 2).

```
display atm pnc 1

                                ATM PNC

                                Connection Number: 1

```

Figure 5-27. Screen output for display atm pnc 2 with End System Identifiers

A500 Administration

Is the AX 500 administered correctly?

1. Enter **show signaling summary** on the A500 console. [Figure 5-28](#) shows the screen output.

```
A500:show signaling summary
```

Port	loc VCI	SAP	IntType	Signaling	ILMI	SAP State	State
A1.1	1	1	Network	UNI3.1	No	UP	UP
A1.2	2	2	Network	UNI3.1	No	UP	UP

Figure 5-28. Screen output for the show signaling summary command

- a. If an A500 port to which a DEFINITY port network is attached is not listed in this display, it is likely that the port was administered incorrectly as having no UNI signaling (**admin link** command).

Ensure that fields listed have the values indicated below.

Field	Value
IntType	Network If it is User, links will not come up between the PPN and the EPN.
Signaling	UNI3.1 If it is UNI3.0, links will not come up between the PPN and the EPN.
ILMI	Preferred value of is No, however this alone does not prevent links from coming up between the PPN and an EPN.
SAP State	May or may not be UP. Their values depend on more than just whether the port was marked as UP. (See highlighted data for SAP State in Figure 5-28.)

- 2. If the A500 was administered using hard-coded PNNI routes to identify each endpoint, enter **show signaling routes** on the A500 console. [Figure 5-29](#) shows the screen output from the command.

```
A500:show signaling routes

Number of Local Static Routes Allowed: 30
Current number of Local Static Routes: 2

Address: 47.00.05.80.ff.e1.00.00.00.f2.07.2a.01.00.00.00.00.00.00
mask:152 cost: 0 node:self port:A1.2 state:UP

Address: 47.00.05.80.ff.e1.00.00.00.f2.07.1b.02.00.00.00.00.00.00
mask:152 cost: 0 node:self port:A1.1 state:UP
```

Figure 5-29. Screen output from the show signaling routes command

Check that the `Address` field (administered using the **admin signaling route add** command) matches those administered in DEFINITY.

3. If the A500 was administered using End System Identifiers, enter **show signaling esi** on the A500 console. [Figure 5-30](#) shows the command output.

```
A500:show signaling esi
Addresses registered on A1.1
-----
* 45.0001.01303538105300000000.000000000011.00

Addresses registered on A1.2
-----
* 45.0001.01303538105300000000.000000000012.00

( * - configured )
```

Figure 5-30. Screen output A500: show signaling esi command

Check that the `Addresses registered` (use the **admin signaling esi add** command) match those administered in DEFINITY.

- If an address or End System Identifier is missing or incorrect on the A500 port associated with the PPN, the EAL and PACL links will come up, but one-way talk paths may result. (The ATM network can route from the PPN to the EPN, which creates the bidirectional EAL and PACL signaling channels and one side of the talk path.)
- If an address or End System Identifier is missing or incorrect on the A500 port associated with the EPN, the links will not come up between the PPN and the EPN.

4. Enter **show sys interfaces** on the A500 console. [Figure 5-31](#) shows the screen output.

Figure 5-31. A500 screen output for show sys interfaces command

- For each administered port used by a DEFINITY port network, the Admin Status should be up (using the **admin up** command).
- The state of Oper Status is not pertinent to administration of the A500 and is discussed in a later section.
- State should be present, indicating that A500 port board insertion was successful. If State is invalid, then the A500 believes that the corresponding port board slot is empty or the port board is not recognized.

It may be necessary to re-administer the A500 port boards. Refer to the *Cajun A500 Quick Reference* for further information.

- If `Admin Status` or `State` is incorrect, the links will not come up between the PPN and the EPN.

TN230X

Did the TN230X come up correctly?

1. Review the LED conditions for the TN230X:
 - Do the TN230X LEDs (see [Table 5-7](#)) indicate a normal operational state (any of the following):
 - Active in the PPN
 - Standby in the PPN
 - Archangel mode in the EPN
 - Standby in the EPN?
2. If after board insertion or a demand reset:
 - Do the TN230X LEDs indicate that it is booting?
 - Do the TN230X LEDs indicate it is downloading its DSPs?
 - Do the TN230X LEDs indicate that board insertion has not yet occurred?
 - Do the TN230X LEDs indicate a maintenance alarm?
3. Enter **list configuration carrier *cabinetcarrier*** on the DEFINITY SAT. See [Figure 5-32](#) (1b) and [Figure 5-33](#) (2a) below.

```
list configuration carrier 1b

Figure 5-33. List configuration carrier 2a screen

- The TN230X board should be shown in the correct slot.
- Fields should have values as indicated below:

Field	Value
Board Type	ATM PNC EI
Vintage	The TN230X vintage. If Vintage is no board, then either the board is in the incorrect slot or board insertion was not completed correctly.

- If the TN230X is inserted and shows a vintage number, enter **test board cabinetcarrierslot** for this board on the DEFINITY SAT, as shown in [Figure 5-34](#) (1b02) and [Figure 5-35](#) (2a01).

```
test board 1b02

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code

02A01     ATM-EI              241        PASS
02A01     ATM-EI              304        PASS
02A01     ATM-EI              1259       PASS
```

Figure 5-35. Screen output for the test board 2a01 command

- The Result should be PASS for each test number. If the any of the tests fail, refer to [“ATM-BCH \(ATM B-Channel Trunk\)”](#).

Possible Causes

1. The TN230X board is in a slot different from the DEFINITY administration.
2. The TN230X did not complete board insertion.

Physical Layer

Is there an optical signal between the TN230X and the A500?

1. Does the TN230X's yellow LED flash 100ms on/100ms off, indicating a loss of signal on the fiber? Recall that the TN230X detects continuity problems with either the Transmit (bottom) or the Receive (top) fibers.
2. Is the A500 port's CD LED off, indicating a loss of signal on the fiber? Note that the A500 detects continuity problems only with the Receive (right-hand) fiber; the state of the Transmit (left-hand) fiber is not detected.
3. Enter **show signaling summary** on the A500 console. [Figure 5-36](#) shows the screen output.

```
A500:show signaling summary
```

Port	loc VCI	SAP	IntType	Signaling	ILMI	SAP State	State
A1.1	1	1	Network	UNI3.1	No	UP	UP
A1.2	2	2	Network	UNI3.1	No	UP	UP

Figure 5-36. A500: show signaling summary screen

Ensure that the fields have the values indicated below.

SAP State Up

If it is PHY_DOWN or DOWN, then there is probably a loss of signal on the port in question. This command detects a continuity problem only with the Receive (right-hand) fiber; it does not detect the state of the Transmit (left-hand) fiber.

State

The value of may be UP or DOWN, depending on the administration of the port. It may be necessary to re-administer the A500 port boards. Refer to the *Cajun A500 Quick Reference* for further information.

4. Enter **show system interfaces** on the A500 console. [Figure 5-37](#) shows an example of the screen output.

Device	Oper Status	Admin Status	State	Type

Self	up	up	present	SAR
E1.1	up	up	present	TenBaseT

Figure 5-37. A500: show sys interfaces

- Oper Status should be up. If it is down, there is likely a loss of signal on the port in question (State of present), or the A500 does not recognize the port board (State of invalid). This command detects a continuity problem only with the Receive (right-hand) fiber; it does not detect the state of the Transmit (left-hand) fiber.

Possible Causes

- The fiber is disconnected from the A500 and/or the TN230Xs.
- The Transmit and Receive fibers are swapped at the A500 or the TN230X (but not both).

- There is a break in the fiber.
- The TN230X is not transmitting a carrier (not inserted, not powered, or not administered). See [“ATM-BCH \(ATM B-Channel Trunk\)”](#).
- Hardware safety interlocks on optical transceivers may cut transmitter power if no carrier is received, so lack of a receive carrier could indicate a transmitter problem at the same end.
- The A500 does not recognize that there is a port board in the slot. It may be necessary to re-administer the A500 port boards. Refer to the *Cajun A500 Quick Reference* for further information.

Recommended Action

1. Plug in, swap, repair, or replace the fiber as necessary.
2. Verify that the port board is inserted.

SONET Layer

Are SONET frames reaching the A500?

Is the A500 port's green RX LED solid off, indicating no cell traffic?

1. Enter **show stats sonet port** on the A500 console. [Figure 5-38](#) shows the screen output.

NOTE:

The following examples point to port A1.2 as the port of interest.

Sonet per Port Statistics

```

-----
Receive Cell Count:      80654
Transmit Cell Count:    79555

Section Level Bit Err:  1
Line Bit Err:           1
Line FEB Err:          168
Path Bit Err:           1
Path FEB Err:           98
Correctable HCS Err:    0
Uncorrectable HCS Err:  0
Loss of Frame Err:      1
Loss of Signal Err:     0
Out of Frame Err:       0

Path Signal Label:      19
    
```

Figure 5-38. A500: show stats sonet a1.2 screen

Ensure that the fields have the values indicated below.

Receive Cell Count Each field's values should be increasing if the TN230X is actively sending and receiving cells with the A500. (Even if a TN230X did not achieve board insertion, it will still try to talk to the A500.)

Transmit Cell Count If neither field is increasing, the A500 port may have been marked down using the **admin down** command. Use the **show system interfaces** command to verify that the Admin Status is up.

If the Receive Cell Count is increasing but the Transmit Cell Count is not increasing, this may be because the port was administered with no UNI signaling (**admin link** command). Use the **show signaling summary** command to ensure that Signaling is UNI3.1.

The error counters may not be zero, but should not be large either compared to the receive and transmit cell counters. If the counters are large and increasing, check the fiber integrity. Make sure the fiber pairs are securely plugged into both the TN230X and the A500.

If the fiber has been pulled and reinserted as part of fault diagnosis, the non-zero Loss of Signal Err counter may be correct.

Q.SAAL (Data Link) Layer

Are ATM signaling messages reaching A500 Call Control?

1. Enter **show signaling stats port qsaal** on the A500 console. [Figure 5-39](#) shows the screen output.

```
A500: show signaling stats a1.2 qsaal

-----Q.SAAL Statistics-----
Port A1.2:
-----
Type: UNI3.1
VPI: 0x00, VCI: 0x05

          Tx          Rx
-----  -  -----  -
BGN PDUs:          0          1
BGAK PDUs:          1          0
END PDUs:           0          0
ENDAK PDUs:         0          0
RS PDUs:            0          0
RSAK PDUs:          0          0
BGREJ PDUs:         0          0
SD PDUs:           81          78
SDP PDUs:  Supported only for UNI 3.0
ER PDUs:            0          0
POLL PDUs:         6259         5720
STAT PDUs:         5720         6259
USTAT PDUs:         0          0
ERAK PDUs:          0          0
Discarded PDUs:    0          0
Errored PDUs:      0          0
Buffers in use:    0          0
High buffer mark:  3          0
```

Figure 5-39. A500: show signaling stats a1.2 qsaal screen

⇒ NOTE:

If there is no connection between the TN230X and the A500 at the Q.SAAL protocol layer, then no report is displayed.

- If Port A1.2 (or the port of interest) is not configured for UNI signaling, then the port was administered for no UNI signaling (**admin link** command). Use the **show signaling summary** command to verify that Signaling is UNI3.1.
- The Supported only for UNI 3.0 line for the SDP PDUs: field means that the port was administered for UNI3.0 signaling (**admin link** command). Use the **show signaling summary** command to verify that Signaling is UNI3.1.

- The POLL PDUs and STAT PDUs counters should be increasing if the TN230X is actively sending and receiving Q.SAAL Protocol Data Units with the A500. This occurs even if the TN230X did not achieve board insertion.

Q.93B (Network) Layer

Are connection requests being received by A500 Call Control?

1. Enter **show signaling stats port q93b** (or the port of interest) on the A500 console. [Figure 5-40](#) shows the screen output.

```
A500:show signaling stats a1.2 q93b
```

```
-----Q.93B Statistics-----
```

```
Port A1.2:
```

	Tx	Rx
Connect Messages:	15	18
Setup Messages:	18	15
Release Messages:	17	13
Rel Cmpl't Messages:	13	17
Add Party Messages:	0	0
Add Party Acks:	0	0
Add Party Rejects:	0	0
Drop Party Messages:	0	0
Drop Party Acks:	0	0
Last Cause Code:	31	31
Last Diag Code:	0. 0. 0	71. 0.29
Total Connections:	33	
Current Connections:	3	

Figure 5-40. A500:show signaling stats A1.2 q93b

⇒ NOTE:

If there is no connection between the TN230X and the A500 at the Q93B protocol layer, then no report displays.

Ensure that the fields have the values indicated below.

Port A1.2 (or the port of interest)	If this field is not configured for UNI signaling, then the port was administered for no UNI signaling (admin link command). Use the show signaling summary command to verify that Signaling is UNI3.1.
---	--

Connect Messages	These counters should be non-zero if the A500 is handling Q.93B protocol layer messages sent by the PPN and EPN. They may not increase during troubleshooting unless calls are being made, since the PPN initially sets up control connections to the PPN and then sets up talk path connections as needed.
Setup Messages	
Release Messages	

2. If connections are being rejected, the `Last Cause Code` may give a clue to why. The Cause Code ([Table 5-9](#) below) indicating the error may be on the PPN port even though the EPN port is the one misbehaving, and vice versa.

Enter **show signaling cause *causecode*** on the A500 console. [Figure 5-41](#) shows the screen output for this command.

```
A500:show signaling cause 31  
Cause 31: Normal, unspecified
```

Figure 5-41. A500:show signaling cause 31

3. At the DEFINITY SAT type **display errors** and press Enter.

Set the `Error List` to **errors** and `Category` to **PNC** on the input screen ([Figure 5-42](#)) and press Enter to display any Cause Codes (see [Table 5-9](#) below) returned from the ATM network to a TN230X on the PPN (and to a TN230X on an EPN). This is successful only if the links between the PPN and the EPN remain up so that the message from the EPN is logged.

Refer to "[ATM-BCH \(ATM B-Channel Trunk\)](#)" for detailed information regarding Cause Codes for this Maintenance Object.

```

display errors                                     Page 1 of 1  SPE A
                                     ERROR REPORT

```

Figure 5-43. Screen output for display errors command

In this example the errors that have ATM-NTWK for Name and 1 for Data indicate an error returned to the TN230X from the ATM network. In this case, Type indicates the Cause Code returned by the ATM network (see [Table 5-9](#) below). In the example above, two Cause Codes (41 and 3) are reported from the ATM network. For more information about these Cause Codes and repair information see [“ATM-NTWK \(ATM Network Error\)”](#).

Table 5-9. Observed Cause Codes

Cause Code	Definition	Observed Cause
3	No route to destination	The ATM addresses administered in the ATM switch (show signaling routes or show signaling esi) or in DEFINITY (display atm pnc) are incorrect.
31	Normal, unspecified	This is a normal return.
41	Temporary failure	This "try again later" Cause Code has been observed when the source of the problem is on another port (for example, a routing problem on another port that displays Cause Code 3).
47	Resources unavailable, unspecified	DEFINITY call volume is too high for the available resources in the ATM network.
63	Service or option unavailable, unspecified	DEFINITY call volume is too high for the available resources in the ATM network.

ATM Call Control

Are ATM signaling connections being setup to A500 Call Control?

1. Enter **show switch circuittable** on the A500 console. [Figure 5-44](#) shows the screen output.

```
A500:show switch circuittable
```

Input			Output			Connection		
port	vpi	vci	port	vpi	vci	type	class	parameters
A1.1	0	5	Self	0	1	pp	UBR	ppd on
A1.1	0	32	A1.2	0	32	pp	VBRnrt	pcr=5729 /scr=5729 /mbs=17187
A1.1	0	35	A1.2	0	35	pmp	CBR	pcr=173
A1.2	0	5	Self	0	2	pp	UBR	ppd on
A1.2	0	32	A1.1	0	32	pp	VBRnrt	pcr=5729 /scr=5729 /mbs=17187
A1.2	0	34	A1.1	0	34	pmp	CBR	pcr=173
Self	0	1	A1.1	0	5	pp	UBR	ppd on
Self	0	2	A1.2	0	5	pp	UBR	ppd on

Figure 5-44. A500: show switch circuittable screen

- The `pp` UBR virtual circuits between A500 ports `A1.1` (PPN) and `Self` (A500) and between `A1.2` (EPN) and `Self` (A500) are ATM signaling channels between the port network and the A500.
- They are used to request connection setups and releases to other end points such as another port network.
- These are established by each TN230X when it comes up, independent of DEFINITY Call Processing.
- Other UBR virtual circuits may exist between A500 ports that are not associated with DEFINITY port networks and may be signaling channels for other applications (for example, data network traffic).

CaPro Layer

Are control channels being established from the PPN to the EPN?

Diagnostics

- Do you get a dial tone on a set on the port network in question?
 - Can you ring a set on the EPN dialing from the PPN and vice versa?
1. Enter **list sys-link** on the DEFINITY SAT. [Figure 5-45](#) shows the screen output.

```
list sys-link
```

SYSTEM LINKS INFORMATION

Location	Link Type/ Channel	State	Current Path	Faulted Path	Last Fault Recorded
02A0101	EAL	up	present	present	12/06/1997 16:20
01B0202	PACL	up	present	present	12/06/1997 16:17
02A0102	PACL	up	present	present	12/06/1997 16:20

Figure 5-45. List sys-link screen

Ensure that the fields have the values indicated below.

Link Type/ Channel	One PACL to each TN230X in either a PPN or an EPN, and one EAL to each TN230X in an EPN.
State	up

2. Enter **show switch circuittable** on the A500 console. [Figure 5-46](#) shows the screen output.

```
A500:show switch circuit
```

Figure 5-46. A500: show switch circuit screen

- The pp VBRnrt (Variable Bit Rate) virtual circuits between A500 ports A1.1 (PPN) and A1.2 (EPN) are used for signaling between the PPN and each EPN.
- These are established once upon initialization under control of DEFINITY Call Processing. They represent the ATM Control Link (ACL) and Expansion Archangel Link (EAL).
- VBRnrt virtual circuits are also be used for ISDN channels between Definity port networks.
- Other VBRnrt virtual circuits may exist between A500 ports that are not associated with DEFINITY port networks. A common use of VBRnrt circuits is multimedia and video-conferencing systems.

CaPro Layer

Are talk paths being established between port networks?

Diagnostics

- Can you talk both ways on a set on one port network dialed from another port network and vice versa?
1. Enter **show switch circuit** on the A500 console. [Figure 5-47](#) shows the screen output.

```
A500:show switch circuit
```

Input			Output			Connection

Figure 5-47. A500:show switch circuit screen

- The pmp CBR (Constant Bit Rate) virtual circuits (VCs) between A500 port A1.1 (PPN) and A500 port A1.2 (EPN) are used for talk paths between port networks (PPN to EPN, EPN to PPN, or EPN to EPN).
- They are established when calls are first setup between port networks. Each virtual circuit represents one party of a complete multiparty talk path.
- The report above shows one complete talk path: one unidirectional point-to-multipoint virtual circuit from A1.1 to A1.2, and another from A1.2 to A1.1.
- These virtual circuits may persist beyond the duration of a phone call. The DEFINITY Call Processing software saves virtual circuits for a few seconds after the end stations have hung up in case the VC can be used again for another call between the same two port networks.
- In early version of the Release 2 A500 firmware, these connections incorrectly identified as pmp UBR.
- There may be other CBR virtual circuits between A500 ports that are not associated with DEFINITY port networks. A common CBR application is Circuit Emulation, in which T-1, T-3, etc. circuits are carried over ATM.

Unusual ATM trouble conditions

There are a few failure modes in the DEFINITY/A500 combination that are particularly difficult to diagnose. One example might be that you can't make a completely successful call, even though most indications from DEFINITY and the A500 look pretty good. This section documents some hints and clues that may help diagnose the following failure modes:

- [Incorrectly typed or omitted EPN Route or End System Identifier \(A500\)](#)
- [Swapped Routes, End System Identifiers, or Fiber between a PPN and an EPN](#)
- [Swapped Routes, End System Identifiers, or Fiber between A and B side TN230Xs on an EPN](#)
- [Swapped Routes, End System Identifiers, or Fiber between two EPNs](#)

Incorrectly typed or omitted EPN Route or End System Identifier (A500)

Symptoms

Talk paths are one-way, from the PPN to the EPN: you can hear tones from the PPN end station to the EPN end station but not vice versa. Because the signaling channels are bidirectional virtual circuits (VCs) established from the PPN to the EPN, these can be routed correctly and come up just fine. Talk paths are two unidirectional virtual circuits, so a single call has one VC from the PPN to the EPN (which is routed correctly) and one VC from the EPN to the PPN (which cannot be routed).

Diagnostics

1. At the A500 use the **show signaling routes** or **show signaling esi** command(s) as appropriate to check the ATM addresses.
2. Use **show signaling stats port q93b** on the EPN port and look for Cause Code 3 (No route to destination).

Action

1. Correct the ATM address translations in the A500.

Swapped Routes, End System Identifiers, or Fiber between a PPN and an EPN

Symptoms

- An incorrectly-connected EPN TN230X does not complete board insertion.
- Dial tone is present on end stations on the PPN and on correctly-connected EPNs, but no dial tone is present on the affected EPN end stations.
- Calls cannot be made between the PPN and the correctly connected EPNs, because talk paths cannot be routed correctly.

Diagnostics

1. The **show switch circuittable** command on the A500 shows VBR control channels from the A500 port intended for the incorrectly-connected EPN (but actually connected logically or physically to the PPN) that should not exist.

Action

1. Correct the ATM addresses (or swap fibers) on the A500 between the incorrectly-connected PPN and EPN.

Swapped Routes, End System Identifiers, or Fiber between two EPNs

Symptoms

- All TN230Xs complete board insertion.
- The PPN cold starts both incorrectly connected EPNs as usual.
- Both EPNs log many `WRONG BOARD INSERTED` errors (use **list configuration all** or **display circuit-packs <carrier>**) providing the EPNs actually do have different boards configured in the same slots.
- Some end stations may work if they are connected to the correct board in the same slot on both EPNs. Otherwise, end stations on the PPN have dial tone, while end stations on the EPNs do not.
- All A500 diagnostic commands look good.

Diagnostics

1. Check log for `WRONG BOARD INSERTED` errors (use **list configuration all** or **display circuit-packs <carrier>**).

Action

1. Correct the ATM addresses (or swap fibers) on the A500 between the incorrectly connected EPNs.

Swapped Routes, End System Identifiers, or Fiber between A and B side TN230Xs on an EPN

Symptoms

- The PPN establishes links to what it thinks is the active TN230X on the EPN.
- As normal, it reboots this TN230X, and when complete, it resets the EPN. When this happens, the active (instead of the standby) TN230X reboots, dropping the links.
- To recover, the PPN re-establishes links to what it thinks is the active TN230X and the cycle repeats indefinitely.

Diagnostics

1. The **status pnc** command on the DEFINITY SAT shows both the A-side and B-side State of Health field as partially functional.

Action

1. Correct the ATM addresses (or swap fibers) on the A500 between the A and B side of the EPN.

Reliability Systems: A Maintenance Aid

6

General

A High or Critical Reliability system provides highly-available call processing because single points-of-failure in the system that result in loss of call processing are minimized. Such a system

- Uses existing duplicated TDM buses
- Duplicates the SPE, translation card, and Tone-Clock circuit pack
- Packet bus redundancy

Each of these components are single points of failure in a standard reliability system.

Duplicated SPE

The two SPEs are mounted in separate carriers and powered by different carrier power supplies. As a result, a high or critical reliability system has two control carriers: the A control cabinet and the B control cabinet.

Since the circuit packs in the two SPEs are the same, the SPEs have identical capabilities. Either SPE can act as the active SPE. However, only one of the SPEs can be the active SPE at any given time. The active SPE performs the same operations that the single SPE performs in a standard system; that is, all call processing, administration, and maintenance activities being performed by the switch. All memory writes performed on the active SPE are copied to the other SPE. The other SPE is known as the standby SPE. Its role is to take over as the active SPE if the current active SPE fails. If the active SPE (or a component of the active SPE) fails, the system automatically switches to the standby SPE.

Under normal conditions, the system operates using both TDM Buses. If the system detects transmission problems on one of the buses, it takes that bus out of service and operates with only one bus, but also reduces capacity. However, if the system detects a problem with one of the Tone-Clock circuit packs, it is able to take that circuit pack out of service without any impact on system capacity or performance.

The Packet Bus is NOT duplicated in the same way that the TDM Bus is duplicated (that is, there is one Packet Bus, while there are two TDM Buses). However, there are several spare leads on the Packet Bus that are not normally used.

In a High or Critical Reliability systems, the TN771 Maintenance/Test circuit pack is required in the PPN, but is optional in EPNs. In Critical Reliability systems, the TN771 is required in both the PPN and each EPN. This circuit pack detects faulty Packet Bus leads and instructs all Packet circuit packs (for example, ISDN-BRI, Packet Control, or TN570 Expansion Interface) to use up to three spare leads in place of defective ones.

The rest of this chapter provides a detailed descriptions of the High and Critical Reliability systems that are available as well as of the Standard system that is available across the board. The chapter explains the duplicated hardware and includes a description of the TN772 Duplication Interface circuit pack. It provides a look at the following concepts relevant to High or Critical Reliability systems: memory shadowing, SPE modes, and SPE-interchanges.

In addition, this chapter contains technical descriptions important to the general maintenance of High and Critical Reliability systems, such as a list of the appropriate system technician commands, SPE circuit pack LED strategies, installation and replacement procedures for SPE Control Carrier circuit packs, and for the Inter-Carrier Cable (ICC).

This chapter uses the terms "Standard Reliability system" or "Standard system" to denote a system without duplication.

Reliability Options

Standard, High and Critical reliability systems offer an increased level of reliability by duplicating various components so that standby components can take over (interchange) when a failure occurs on an active component. Most interchanges take place with no disruption of current service and allow for repairs to be made without disruption. Furthermore, duplication allows for the upgrading and maintenance of duplicated components and software without service disruption. The following sections describe which components are duplicated with each option.

Standard Reliability

On standard reliability systems, the 512-time-slot TDM bus is divided into two duplicate 256-time-slot buses, A and B. Call traffic is shared between the two buses. The first five time slots on each bus are reserved for the control channel, which is active on only one of the two buses at a time. Likewise, the next 17 time slots are reserved for carrying system tones. The tone time slots are not necessarily on the same bus (A or B) as the control channel. If any failure that affects the ability of the active control channel or the tone time slots to function takes place, the other bus becomes active for those time slots. For more information, see TDM-BUS Maintenance section in [Chapter 10, "Maintenance Object Repair Procedures"](#), and the `set tdm` command in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

High Reliability

High Reliability systems duplicate components that are critical to the viability of the system as a whole to prevent a single failure from dropping all service. These components include the following:

- PPN control carrier and carrier power units (OLSSs)
- All SPE circuit packs, including the Processor, Memory, Network Controller, Processor Interface, Packet Controller, and Duplication Interface circuit packs
- PPN Tone Clock circuit pack (EPN Tone-Clocks are not duplicated)
- TDM buses (described in the previous section)

NOTE:

In High reliability systems, a TN771 Maintenance/Test circuit pack is required in the PPN, but is optional in EPNs.

The duplicated SPEs operate in active/standby fashion. Operation of this duplication is described in the STBY-SPE and DUPINT MO sections in [Chapter 10, "Maintenance Object Repair Procedures"](#). Interchanges of the SPE and of PPN Tone-Clocks operate independently unless induced by use of the SPE-select switches.

Critical Reliability

Critical Reliability systems include all of the features of the High Reliability option described in the previous section. Additionally, these systems duplicate components of Port Network Connectivity (PNC) and of other components that are critical to the viability of each EPN. These components include the following:

- PPN and EPN Tone-Clock circuit packs
- PPN and EPN Expansion Interface circuit packs
- Inter-PN cabling

⇒ NOTE:

In Critical Reliability systems, the Tn771 Maintenance/Test circuit pack is required in both the PPN and EPN.

The entire direct-connected fiber is duplicated between each pair of port networks. Each duplicated fiber pair operates in an active/standby manner with all inter-PN calls set up on both fibers so that the active SPE can assume control without disruption of service. Each fiber pair between port networks operates independently of the other fiber pairs with respect to the active/standby operation, that is, the A-carrier fiber can be active between the PPN and EPN 1, and the B-carrier fiber can be active between the PPN and EPN 2.

The Tone-Clocks in each EPN operate in an active/standby manner independently from other duplication strategies.

Duplicated Hardware

A description of the hardware components used in a High or Critical Reliability system follows.

SPE Duplication

Each SPE in a high or critical reliability system consists of the following circuit packs:

- Processor Circuit Pack (TN790)
- Network Control Circuit Pack (TN777B)
- Packet Control Circuit Pack (TN778)

⇒ NOTE:

There may be zero or one Packet Control circuit pack. However, both SPEs must have an equal number of circuit packs.

- Processor Interface Circuit Pack(s) (TN765)

⇒ NOTE:

There may be zero, one, or two Processor Interface circuit pack. However, both SPEs must have an equal number of Processor Interface circuit packs.

- Duplication Interface Circuit Pack (TN772)

Duplication Interface Circuit Pack

The Duplication Interface circuit pack is required to support SPE duplication. Duplication Interface A is part of the SPE in the A control carrier, and Duplication Interface B is part of the SPE in the B control carrier.

The Duplication Interface circuit packs provide a broad range of functionality. Alone, Duplication Interface A provides control of the following components: the duplicated Processor circuit packs, the duplicated Tone-Clock circuit packs, the environmental maintenance monitoring and control, and G3MT terminal connection. Together, Duplication Interface A and Duplication Interface B provide memory shadowing from Active SPE Memory to Standby SPE Memory and communication between software on the Active SPE and the Standby SPE.

Duplication Interface A controls a lead that indicates to the duplicated Processor and Network Control circuit packs, respectively, which SPE is currently the Active SPE. This lead is known as the SPE Select lead. Duplication Interface A controls another set of leads that indicate to the duplicated TN768 and TN780 8

Tone-Clock circuit packs which of the two is currently the active one. These leads are known as the Tone-Clock Select leads. System software can request that the SPE Select lead and/or the Tone-Clock Select leads be changed. Duplication Interface A controls and monitors in the PPN of a High or Critical Reliability system the same set of environmental leads that the EPN TN775 or TN775B Maintenance circuit pack controls and monitors in an EPN.

The Duplication Interface circuit packs communicate with one another over the Inter-Carrier Cable (ICC). In a multicarrier cabinet, the ICC physically consists of two 25-pin connector cables known as ICC-A and ICC-B. In a single-carrier cabinet, the ICC physically consists of three 25-pin connector cables known as ICC-A, ICC-B, and ICC-C. The ICC connects the Duplication Interface circuit packs via pin fields on the backplane. The pin fields where ICC-A and ICC-B (and ICC-C in a single-carrier cabinet) are connected are labeled on the backplane near the pin fields for the Duplication Interface circuit packs. The ICC carries leads related to maintaining a High or Critical Reliability system. Furthermore, without the ICC properly attached, the system cannot function as either a High or Critical Reliability system or as a Standard system.

The Duplication Interface circuit packs support serial links that provide for G3 MT connection, memory shadowing from Active SPE Memory to Standby SPE Memory, and communication between software on the Active SPE and the Standby SPE. Four serial links are supported:

1. The serial link from Duplication Interface A to the G3 MT.
2. The serial link from Duplication Interface A to the Maintenance/Tape Processor in carrier A.
3. The serial link from Duplication Interface A to the Maintenance/Tape Processor in carrier B.

4. The serial link from Duplication Interface A to Duplication Interface B.

 **NOTE:**

The Duplication Interface B circuit pack does not communicate directly with either Maintenance/Tape Processor or with the G3MT.

Duplication Interface A supports the serial channel to the G3MT that is connected to the Duplication Interface A circuit pack by a connector on the back of carrier A labeled "DOT" (Duplication Option Terminal). If the Duplication Interface A circuit pack becomes defective, and the B carrier becomes the Active SPE, the terminal can be connected to the Maintenance/Tape Processor in carrier B by connecting the terminal to the connector labeled "TERM" on the back of carrier B. If the Duplication Interface A circuit pack becomes defective and carrier A becomes the Active SPE, the terminal can be connected to the Maintenance/Tape Processor in carrier A by connecting the terminal to the connector labeled "TERM" on the back of carrier A.

Communication between software on the Active SPE and the Standby SPE is conducted via a message flow between the two Processors. The flow of messages from the Processor in carrier A to the Processor in carrier B is as follows: Processor A to Maintenance/Tape Processor A over the serial link to Duplication Interface A over the serial link to Maintenance/Tape Processor B to Processor B. The flow in the reverse direction is exactly opposite.

The serial link between Duplication Interface A and Duplication Interface B is involved only in memory shadowing from the Active SPE to the Standby SPE as described in the ["Memory Shadowing"](#) section.

SPE Select Switches

The SPE-SELEC (SPE Select) switches are located on the TN772 Duplication Interface circuit packs and are used to hard-select the Active SPE in a high or critical reliability system. "Hard-select" means that the SPE Select switches can be moved from the AUTO position to force the current Active SPE to remain the Active SPE or to force the current Standby SPE to become the Active SPE. Hard selection of the Active SPE using the SPE Select switches overrides any attempts by the system software to switch to the Standby SPE to make it become the Active SPE.

Each switch has three positions:

- SPE-A (the left position)
- AUTO (the middle position)
- SPE-B (the right position)

To hard-select SPE A as the Active SPE, *both* SPE Select switches must be moved **one at a time** to the SPE-A position. To hard-select SPE-B as the Active SPE, *both* SPE Select switches must be moved to the SPE-B position. Any other

combination of SPE Select switches leave control of the Active SPE to the system software.

Inter-Cabinet Cable

As described previously, the ICC connects the two TN772 Duplication Interface circuit packs and is a basis of support for the Duplication Interface circuit pack functionality described previously.

The ICC carries leads related to maintaining a High or Critical Reliability system. The SPE Select lead indicates which SPE is the Active SPE. The Tone-Clock Select leads indicate which Tone-Clock circuit pack is active. SPE Select switch state leads indicate the position of the SPE Select switches. Emergency Transfer leads indicate whether Emergency Transfer is on or off in the PPN cabinet. Other leads “combine” the INADS, CDR, and the Customer-Provided Alarming device channels from the two Maintenance/Tape Processors.

The ICC also carries an indication of whether memory shadowing is enabled or disabled. Information to be shadowed is sent over the serial link between Duplication Interface B and Duplication Interface A; this serial link is carried over the ICC.

Communication between software on the Active SPE and the Standby SPE is sent over the serial link between Duplication Interface A and the Maintenance/Tape Processor in carrier B. This serial link is also carried over the ICC.

The presence of the ICC also causes ID pins on the backplane to indicate that the system is a high or critical reliability system rather than a standard reliability system.

The ICC is difficult to connect, and its proper connection is critical to the operation of the system. Refer to the [“Procedure for Installing/Replacing the Inter-Cabinet Cable”](#) section for details on how to properly connect the ICC.

Tone-Clock Circuit Pack Duplication

For more information about the Tone-Clock circuit packs see TONE-BD in [Chapter 10, “Maintenance Object Repair Procedures”](#).

The TONE-BD (Tone-Clock) MO functionality is made up of the TONE-PT (Tone Generator) and the TDM-CLK (TDM Bus Clock). The Tone Generator provides all tones required by the system; the TDM Bus Clock provides synchronization for the TDM Bus and aids in monitoring and selection of SYNC (Synchronization) references.

Each High or Critical Reliability system provides two Tone-Clock circuit packs. In this configuration, a failed Tone-Clock circuit pack is switched off-line and an operational circuit pack is put on-line. Duplication Interface A selects the Active Tone-Clock circuit pack by driving the Tone-Clock Select lead. The selection of

the Active Tone-Clock circuit pack is independent of the selection of the Active SPE.

Time Division Multiplexing Bus Duplication

The TDM Bus is composed of two separate, independent buses called bus A and bus B. The first five time slots of both buses are reserved for communication between the SPE and port circuit packs. These time slots are known as the control channel. The control channel is a vital component and must be operational for the system to provide meaningful customer voice and data services. In addition to the control channel time slots, several other time slots are reserved for system use. These additional time slots are for the standard tones. The standard tones include the dial tone and the touch tones.

The ability to move the control channel and tones from a defective TDM Bus to an operational TDM Bus is a key component of a highly-available system. The system can detect transmission errors on the control channel, errors can be diagnosed, and corrective actions can be taken when necessary. If a bus is found to be defective, it is taken out-of-service. All existing calls on the out-of-service bus are maintained, but no new calls are assigned to the out-of-service bus.

In addition to the system software's ability to detect a defective bus and perform a TDM Bus switch, the user also has the ability to specify if and when a scheduled control channel switch is to be performed.

Packet Bus Redundancy

The Packet Bus is used to provide ISDN-BRI signaling via the TN778 Packet Control circuit pack. The Packet Bus is not physically duplicated in the same way that the TDM Bus is duplicated. However, there are several spare leads on the Packet Bus itself that are not normally used. The Maintenance/Test circuit pack has the ability to test the Packet Bus and discover shorted or open leads on the Packet Bus. When such a fault is discovered, the Maintenance/Test circuit pack sends a message to each circuit pack that uses the Packet Bus, instructing that circuit pack to use one of the spare leads in place of the defective lead. Additionally, the circuit pack can recover up to three Packet Bus lead failures by this mechanism. This provides high availability by decreasing the chance of a blocking Packet Bus fault by two orders of magnitude.

[Table 6-1](#) indicates when the TN771 Maintenance/Test circuit pack is required in each cabinet or port network.

Table 6-1. TN771 cabinet/port network requirements

Model	Reliability	PACCON	TN771 Maintenance circuit pack required	
			PPN	EPNs ¹
G3s, i, si	Standard	N	N	N
G3s, i, si	Standard	Y ²	Y	N
G3i, si	High	N	N	N
G3i, si	High	Y ²	Y	N
G3i, si	Critical	N	N	N
G3i, si	Critical	Y ²	Y	Y

- 1 EPNs means all port networks in an EPN cabinet, that is, dual port networks may require two TN771s in the cabinet, one per port network.
- 2 For example, a PACCON board is required for BRI/ASA1 or ISDN-PRI using PACCON

Duplication Concepts

High and Critical Reliability systems employ several concepts of duplication. These are described in the following sections.

Memory Shadowing

Most of the time the Standby SPE is in a mode known as Standby Mode (see [“SPE Modes”](#) section) in which it is ready to assume the role of the active SPE. To be ready to assume the role of the active SPE, PR-MEM must be an up-to-date reflection of active SPE Memory. This is accomplished by the memory shadowing mechanism.

The SHDW-CIR (Common Shadow Circuitry) on the Active SPE TN772 DUPINT (Duplication Interface) detects all memory writes that the active SPE PROC R (Processor) makes to Active SPE Memory. The active SPE Common Shadow Circuitry sends this information to the Common Shadow Circuitry on the Standby SPE Duplication Interface via the ICC. The Common Shadow Circuitry on the Standby SPE Duplication Interface then writes the data to Standby SPE Memory. This logical connection between Active SPE Memory and Standby SPE Memory is known as the SHDW-LNK (Memory Shadowing Link).

Although most of the components making up the Memory Shadowing Link (that is, Active SPE Memory, both sets of Common Shadow Circuitry, and Standby SPE Memory) are tested and maintained individually, the integrity of the entire logical connection is also tested and maintained to make sure that the shadowing mechanism is functional and that Standby SPE Memory is the same as Active

SPE Memory. Therefore, this testing is done under the guise of the Memory Shadowing Link.

SPE Modes

As described earlier, the Active SPE is the SPE that is currently responsible for all call processing, administration, and maintenance activities being performed by the switch. The Active SPE is always in Active Mode.

The role of the Standby SPE is to be ready to take over as the Active SPE in the event that the current Active SPE fails. The Standby SPE does not perform Call Processing or Administration activities. It does perform Maintenance activity, but this is carried out completely under the direction of the Active SPE in order to monitor and maintain the health of the Standby SPE.

The Standby SPE is always in one of three modes: Standby, Maintenance, Busyout, or Down. Usually the Standby SPE is in Standby Mode. In this mode, the SW-CTL (Switch Control) on the Standby SPE Network Control circuit pack is isolated from the TDM Bus so that it does not attempt to control the bus and interfere with the Switch Control on the Active SPE Network Control circuit pack. Similarly, the Standby SPE Packet Control circuit pack is isolated from the Packet Bus so that it does not attempt to control the Packet bus, and thus interfere with the Active SPE Packet Control circuit pack. The Standby SPE PROCR (Processor) is held in a reset state so that it does not run software. Finally, Standby SPE is being shadowed into from Active SPE Memory—meaning that Standby SPE Memory is updated to reflect every change in Active SPE Memory (for example, calls and administration changes). In Standby Mode, the Standby SPE is available to assume the role of the Active SPE.

In certain circumstances, the Standby SPE is put into Maintenance Mode by the Active SPE. In this mode, the Standby SPE is still isolated from the TDM and Packet Buses, but is no longer having its Memory shadowed into; its Processor is no longer held in a reset state. In Maintenance Mode, the Standby SPE accepts maintenance activity requests from the Active SPE to perform testing on Standby SPE components. For many of the requested activities, system software on the Standby SPE is brought up to conduct the activity. Translation saves and announcement saves may be performed on the Standby SPE when it is in Maintenance Mode. While in Maintenance Mode, the Standby SPE is not as readily available to assume the role of the Active SPE, but may do so depending on the severity of the Active SPE fault(s).

In Busyout Mode, the Standby SPE is busied out by the *busyout SPE-standby* command. Only system technician-requested activities are carried out on the Standby SPE until a *release SPE-standby* command is executed. Refer to the **status system** command in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#) for information concerning Standby Modes. Whenever the Standby SPE is returned to Standby Mode from Maintenance Mode, its Memory is refreshed.

⇒ NOTE:

Verify that the Standby SPE is functional (no duplication alarms exist and the SPE has returned to the Standby Mode) by running the **status system 1** command. If the standby SPE is in the maint/idle mode with no standby alarms, use the **standby refresh** command to put the standby SPE into the standby mode. Verify the results by using the **status system 1** command. For more information about the **status system** command see [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

⇒ NOTE:

The system software automatically returns the Standby SPE from Maintenance Mode to Standby Mode at the completion of any maintenance activity. However, it is also possible to force the Standby SPE to return to Standby Mode by issuing the **refresh spe-standby** command from the G3MT terminal. The **refresh spe-standby** command preempts Standby SPE Maintenance Mode except that of entering maintenance mode. See the "[System Technician Commands for High and Critical Reliability Systems](#)" section for a description of the **refresh spe-standby** command.

This means that all of Active SPE DRAM Memory is shadowed over into Standby SPE Memory. The refresh is necessary because, while in Maintenance Mode, memory shadowing to the Standby SPE is disabled, and Standby SPE Memory is not updated to reflect changes in Active SPE Memory. After the refresh, Standby SPE Memory is again an up-to-date reflection of Active SPE Memory.

The Standby SPE goes into Down Mode when certain error conditions are detected. These error conditions are described in detail in the "Hardware Error Log Entries and Test to Clear Values" section of STBY-SPE (Standby SPE) Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#). Once the error condition(s) that caused the Standby SPE to go into Down Mode is (are) corrected, the Standby SPE is first put into Maintenance Mode to conduct testing on Standby SPE components and is then returned to Standby Mode.

The current mode of the Standby SPE can be determined by issuing the **status system** command.

SPE-Interchanges

The process by which the Standby SPE takes over for the Active SPE is referred to as an SPE-interchange. There are six conditions under which an SPE-interchange is initiated:

- Upgrade Software

Issuing the **upgrade software** command to upgrade the software on a High or Critical Reliability system reboots the Standby SPE from the standby translation card and then invokes an SPE-interchange so that the system is now running on the new software.

- System Technician Command

Issuing the **reset system interchange** command on the G3MT terminal causes an SPE-interchange to be initiated.

- Alarm Condition

If a Major or Minor alarm is activated on any circuit pack, an SPE-interchange is initiated, provided the health of the Standby SPE is better than that of the Active SPE. [Table 6-2](#) lists the MOs, the alarm levels, the level of SPE-interchange initiated, and the severity given to the alarm for all MOs that can cause software requested SPE-interchanges. The health of an SPE is based upon the single most severe alarm active within that SPE. The higher the severity level, the more severe the problem. The restart level of the interchange also depends on the single most severe alarm within the active SPE. Hot Restarts occur only when the Standby SPE is in standby mode. For example, the active SPE has a MAJOR SHDW-CIR and a MINOR DATA-BD alarm, and the standby SPE has a MAJOR TAPE alarm. In this case, the severity level of the active is 60, the severity level of the standby is 65, and no SPE-interchange would occur.

- SPE Select Switches

An SPE-interchange can be initiated by moving both SPE Select Switches, **one at a time**, to the position that selects the Standby SPE for Active Mode. The SPE Select Switches were described earlier in this chapter.

- Scheduled Maintenance

An SPE-interchange can be requested as a part of scheduled maintenance. This mechanism is used to exercise both SPEs. An SPE-interchange can be requested as part of scheduled maintenance by issuing the **change system-parameters maintenance** command and updating the form.

- Processor Insanity

Duplication Interface A (DUPINT, TN772) periodically audits the sanity of each of the Processor circuit packs. If the Active SPE does not respond to the sanity audit, Duplication Interface A initiates an SPE-interchange.

Table 6-2. Software-Requested Interchanges Caused by Alarm Conditions

Maintenance Object	Alarm Level	On/Off Board	Fault Severity Level	Restart Level
STBY-SPE	WARNING	OFF	120	None
MEM-BD	MAJOR or MINOR	ON	110	Hot or Warm ¹
MEMORY	MAJOR or MINOR	ON	110	Hot or Warm ¹
STBY-SPE	MAJOR	ON	100	None
PROCR	MAJOR	ON	70	Hot or Warm ¹
SW-CTL	MAJOR	ON	65	Cold 2
MEM-CARD	MAJOR	OFF	65	Cold 1
12V-PWR	MINOR	ON	65	Hot
DUPINT	MAJOR	ON	61	Hot
CARR-POW	MAJOR	ON	61	Cold 2
SHDW-CIR	MAJOR	ON or OFF	60	Warm
SHDW-LINK	MAJOR	ON	60	Warm
SW-CTL	MINOR	ON	40	Hot
PR-MAINT	MINOR	ON	30	Hot
PI-BD	MAJOR or MINOR	ON	20	Hot
PKT-CTRL	MAJOR	ON or OFF	20	Hot
PKT-CTRL	MINOR	ON or OFF	15	Hot
PI-PT	MAJOR	ON	15	Hot
DATA-CHL	MINOR	ON	15	Hot
DATA-CON	MINOR	ON	15	Hot
DATA-BD	MINOR	ON	15	Hot
CARD-MEM	MINOR	ON or OFF	10	Hot
PR-MAINT	MINOR	OFF	8	Hot

¹ If the Standby SPE is in Standby mode when the alarm occurs, a Hot SPE-Interchange occurs. If the Standby is in Maintenance mode when the alarm occurs, however, a Warm SPE-Interchange rather than a Hot SPE-Interchange occurs.

Regardless of the condition that initiates an SPE-interchange, the G3MT is always logged off as a result of the SPE-interchange. The G3MT is available to log into after the SPE-interchange is complete and the "login" prompt is displayed.

System Technician Commands for High and Critical Reliability Systems

The following system technician commands support high and critical reliability systems. Complete descriptions of these commands are found in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

Commands for SPE Duplication

- The **busyout SPE-standby** command stops all background maintenance activities on the Standby SPE, and it doubles memory shadowing.
- The **release SPE-standby** command refreshes the Standby SPE, and it allows all background standby maintenance activities to continue.
- The **status system** command displays the status of the Active SPE and the Standby SPE (among other information).

⇒ NOTE:

Verify that the Standby SPE is functional (no duplication alarms exist and the SPE has returned to the Standby Mode) by running the **status system 1** command. If the standby SPE is in the maint/idle mode with no standby alarms, use the **standby refresh** command to put the standby SPE into the standby mode. Verify the results by using the **status system 1** command. For more information about the **status system** command see [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

- The **status mem-card [1] a|b** command displays the status of the Active SPE Memory Card or the status of the Standby SPE Memory Card.
- The **test processor [1] a | b [short | long]** command tests the specified Processor circuit pack.
- The **test memory [1] a | b [short | long]** command tests the specified on-circuit pack memory with an optional Memory Expansion circuit pack.
- The **test card-mem [1] a | b [short | long]** command tests either the Active SPE Memory Card or the Standby SPE Memory Card.
- The **test network-control [1] a | b [short | long]** command tests the specified TN777B Network Control circuit pack and the Memory Card.
- The **test packet-control [1] a | b [short | long]** command tests the specified TN778 Packet Control circuit pack.
- The **test interface [1] a1 | b1 [short | long]** command tests the specified first TN765 Processor Interface circuit pack.
- The **test interface [1] a2 | b2 [short | long]** command tests the specified second TN765 Processor Interface circuit pack.

- The **test duplication-interface [1] a | b [short | long]** command tests the specified TN772 Duplication Interface circuit pack.
- The **test shadow-link** command tests the SHDW-LINK (Memory Shadowing Link). Refer to “MEM-BD” in [Chapter 10, “Maintenance Object Repair Procedures”](#) for a detailed description of this command.
- The **set vector <level> [spe-active | spe-standby | spe-maint]** command requests that a core dump be taken when a system restart of level <level> occurs.
- The **reset system interchange** command requests an SPE-interchange.
- The **test spe-standby [short | long]** command tests the Processor, Memory, Network Control, Processor Interface, Duplication Interface, and translation card circuit packs in the control carrier containing the Standby SPE. Refer to “STBY-SPE” in [Chapter 10, “Maintenance Object Repair Procedures”](#) for a detailed description of this command.
- The **refresh spe-standby** puts the Standby SPE into Standby mode.

**CAUTION:**

Because of the power of the “refresh spe-standby” command, its full impact is described here so that it is clearly understood.

The **refresh spe-standby** command is used to immediately put the Standby SPE into Standby Mode. The command conducts the same activities regardless of whether the Standby SPE is already in Standby Mode or whether it is in Maintenance Mode. When this command is issued, most Standby SPE maintenance activity that is currently in progress is preempted, the Standby SPE Processor is held reset, and the Standby SPE Memory is refreshed (that is, all of Active SPE DRAM Memory is shadowed to Standby SPE Memory). Recall that the refresh is necessary because, while the Standby SPE is in Maintenance Mode, memory shadowing is disabled. When the Standby SPE is returned to Standby Mode, its Memory must be brought up-to-date with Active SPE Memory. If the system was trying to enter Maintenance Mode, the **refresh spe-standby** command aborts with the message, “Cannot interrupt Standby SPE while entering maintenance mode; please try later.”

**WARNING:**

Because of its power to preempt Standby SPE maintenance activities, the refresh spe-standby command should be used judiciously. If the Standby SPE is in Maintenance Mode when the “refresh spe-standby” command is issued, the maintenance activity that is being conducted by the Standby SPE is immediately terminated.

The following side-effects may occur:

- Testing of the Standby SPE components that are the target of the maintenance activity may not have completed. Depending on the maintenance activity and the point at which it is terminated, tests that

detect faults and/or lack of faults on those Standby SPE components may not have had the opportunity to run. Accordingly, alarms are not raised or retired on the components.

- If the maintenance activity is scheduled maintenance, and if the **refresh spe-standby** command is issued before a scheduled translation save is performed, the translation save is not done, and the translation data on both the Active SPE and Standby SPE tapes or memory cards do not reflect changes made since the last translation save.

In general, after a **refresh spe-standby** command has been used and the user has finished working with the system, the **test spe-standby long** command should be issued if the **refresh spe-standby** command preempted a Standby SPE maintenance activity.

Additionally, if the **refresh spe-standby** command was used in the time frame in which scheduled maintenance with a translation save was to have been conducted, the **save translation** command should be issued to ensure that the current translation data has been written to the Active SPE and Standby SPE tapes or Memory Cards. When using the **refresh spe-standby** command to preempt Standby SPE maintenance activities, it may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. This does not include cases where the command completes with the G3MT terminal message "Refresh not successful; use 'display errors' to check for STBY-SPE errors" or "Cannot interrupt Standby SPE while entering maintenance mode; please try later." Issue the **refresh spe-standby** command once more.

Commands for TDM Bus Duplication

- The **status system** command displays the bus on which the control channel and tones currently reside (among other information).
- The **test tdm port-network [1 | 2 | 3] [short | long]** command tests both TDM Buses.
- The **set tdm port-network [1 | 2 | 3] a | b [override]** command moves the control channel and dedicated tones to the specified TDM Bus.
- The **busyout tdm port-network [1 | 2 | 3] bus a | b** command places the specified bus in a maintenance busy state.
- The **release tdm port-network [1 | 2 | 3] bus a | b** command places a busied-out bus back in service.

Commands for Packet Bus Redundancy

- The **status system** command displays the status of the Packet Bus, and the number of faulty and open leads that the Maintenance/Test circuit pack has found.
- The **test pkt port-network [1 | 2 | 3]** command tests the Packet Bus.

Commands for Tone-Clock Circuit Pack Duplication

- The **status system** command displays the Tone-Clock circuit pack that is currently supplying tones and clocks (among other information).
- The **test tone-clock [1 | 2 | 3] a | b [short | long]** command tests the specified TN768 Tone-Clock circuit pack.
- The **set tone-clock [1 | 2 | 3] a | b [override]** command makes the specified Tone-Clock circuit pack active.
- The **busyout tone-clock [1 | 2 | 3] a | b** command places the specified Tone-Clock circuit pack in the maintenance busy state.

⇒ NOTE:

This cannot be the one that is currently active.

- The **release tone-clock [1 | 2 | 3] a | b** command removes the specified Tone-Clock circuit pack from the maintenance busy state.

Processor Complex Circuit Pack LED Strategies

The LEDs on the circuit packs in the two SPEs have the following meanings:

- Processor Circuit Pack

Yellow	Green	Red	Meaning
On	Off	-	Active mode
On	On	-	Active mode: Maintenance running
Off	On	-	Maintenance mode; Memory not refreshed
Off	Off	-	Maintenance mode; Memory refreshed
-	-	On	Fault on Processor circuit pack

⇒ NOTE:

In addition to the standard LEDs, the Processor circuit pack has the red major and minor alarm LEDs, an amber warning LED, a green ack LED, and a red Emergency Transfer LED.

- Duplication Interface Circuit Pack (PICP)(B carrier) (TN772)::

Yellow	Green	Red	Meaning
On	-	-	SPC in active mode
	On	-	Maintenance running on PICP
-	-	On	Fault on PICP

- Duplication Interface Circuit Pack (DICP)(A carrier) (TN772):

Yellow	Green	Red	Meaning
On	-	-	SPC in active mode, or A carrier Tone-Clock circuit pack active
	On	-	Maintenance running on DICP
-	-	On	Fault on DICP

Each Duplication Interface circuit pack has another red LED associated with the SPE Select Switch. The purpose of the red switch LED is to serve as a reminder that an SPE is being forced to be the Active SPE and, therefore, the system is not duplicated. Both SPE Select Switch LEDs (one on each Duplication Interface circuit pack) are on when an SPE is being forced to be the Active SPE by the consistent positions of the two SPE Select Switches. Both LEDs are extinguished when the SPE Select Switch positions are inconsistent or when both SPE Select Switches are in the position. In the latter two cases, the Active SPE is automatically selected by the system software.

- Processor Interface Circuit Pack (TN765):

Yellow	Green	Red	Meaning
On	-	-	Link terminated at PICP
	On	-	Maintenance running on PICP
-	-	On	Fault on PICP

- Network Control Circuit Pack (TN777B):

Yellow	Green	Red	Meaning
On	-	-	Link terminated at NCCP
	On	-	Maintenance running on NCCP
-	-	On	Fault on NCCP

There is also an yellow LED (below Memory Card slot). When ON, the Memory Card is in use.

- Packet Control Circuit Pack(PCCP)(TN778)

Yellow	Green	Red	Meaning
On	-	-	Link terminated at PCCP
	On	-	Maintenance running on PCCP
-	-	On	Fault on PCCP

- Tone-Clock Circuit Pack:

⇒ NOTE:

For information on the standard amber/green/red LEDs see TONE-BD Maintenance Object in [Chapter 10, "Maintenance Object Repair Procedures"](#).

Repair Procedures for High and Critical Reliability

This section describes the procedure for installing or replacing Standby SPE circuit packs. These circuit packs are:

- Processor Circuit Pack
- Network/Packet Control Circuit Pack
- Processor Interface circuit pack(s)
- Duplication Interface circuit pack

This procedure does **not apply** to the TN768 or TN780 Tone-Clock circuit pack. Refer to 'TONE-BD', 'TONE-PT', or 'TDM-CLK' in [Chapter 10, "Maintenance Object Repair Procedures"](#) for the procedure to replace the Tone-Clock circuit pack.

CAUTION:

When circuit packs in the Active SPE are to be replaced, this section provides procedures for performing an SPE-interchange to place the circuit packs in the Standby SPE mode. SPE circuit packs should never be replaced while they are located in the Active SPE.

Use this section when:

1. Defective (that is, alarmed) Active or Standby SPE circuit packs are to be replaced. The procedure begins at the [“Replacing Defective SPE Circuit Packs”](#) section. Ignore the [“Upgrading SPE Circuit Packs”](#) section, as it does **not apply** to replacing defective Standby SPE circuit packs.
2. Healthy Standby SPE circuit packs are to be upgraded. The procedure begins at the [“Upgrading SPE Circuit Packs”](#) section. Ignore the [“Replacing Defective SPE Circuit Packs”](#) as it does **not apply** to upgrading Standby SPE circuit packs.

The [“Circuit Pack Replacement Procedure”](#) and [“Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs”](#) sections apply to both situations but should be referred to only **after** reading the appropriate sections as instructed previously.

Replacing Defective SPE Circuit Packs

Determine that software is running by looking at the G3MT and verifying that it does not have either the “SPE DOWN MODE” or the “Duplication Interface - Processing Element Communication Down” message displayed.

Software Not Running

If system software is not running or if it stops running at any point during this procedure, the suggested order of Processor Complex circuit packs to replace in an attempt to fix the SPE down problem is:

- Processor Circuit Pack (TN790)
- Network Control Circuit Pack (TN777[B])
- Packet Control circuit pack (TN778)
- Duplication Interface circuit pack (TN772)
- Processor Interface circuit pack (TN765)

Software Running

If system software is running, determine which SPE is the Standby SPE by issuing the **status system** command from the G3MT terminal. Look at the SPE and MODE fields in the upper left corner of the form to determine which SPE (A or B) is the Active SPE; it is labeled as "active." The other SPE is the Standby SPE and is labeled as either "standby," "maint," or "down."

Follow the "Circuit Pack Replacement Procedure" described later for each Standby SPE circuit pack to be replaced. Continue with this procedure as follows.

1. If alarms are against the Active SHDW-CIR, Active DUPINT, or SHDW-LNK, replace the Duplication Interface circuit pack. Proceed to the ["Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE"](#) or ["Handling DUPINT Alarms in the Active SPE"](#) sections as applicable.
2. If these sections do not need to be referenced, proceed to the ["Circuit Pack Replacement Procedure"](#) section.

The rest of this section describes how the system behaves when there are faulty circuit packs in the SPEs and is meant to be informative rather than part of the general procedure of replacing SPE circuit packs.

NOTE:

When circuit packs **other than the Duplication Interface circuit pack in the Active SPE** are defective, the SPE containing the more severely defective circuit packs is usually in the Standby SPE.

Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE

Check for the existence of SHDW-CIR alarms against the Active SPE Duplication Interface circuit pack or SHDW-LNK alarms. If there are Active SPE SHDW-CIR or SHDW-LNK alarms, inform the customer that a COLD 2 restart of the system is needed and determine a time at which to restart may be. At that time, complete the following steps:

1. Make sure that the tape (memory card) in the Active SPE tape unit (memory card slot) has the most current translations. If it does not, issue the **save translations spe-active** command to put the most current translations on it.
2. Exchange the tapes (memory cards) in the Active SPE and Standby SPE so that the Standby SPE tape unit (memory card slot) contains the tape (memory card) from the previous step.
3. For a 386 system, if the Standby SPE is not in standby mode, issue the **refresh spe-standby** command to put it into standby mode if possible (see the previous Note). If the Standby SPE was successfully put into standby mode, then issue the **reset system interchange** command to

cause a PEI. If the refresh or system interchange are unsuccessful, then use the SPE select switches to hard select the Standby SPE (this will result in a COLD 2 restart of the system).

4. If the **upgrade software (reset system interchange)** command is successful, an SPE-interchange results in the new Active SPE performing a COLD 2 (HOT) restart. Follow the "Circuit Pack Replacement Procedure" described later. If the **upgrade software** command failed, determine why the failure occurred, resolve the problem, and repeat this entire procedure.

Handling DUPINT Alarms in the Active SPE

Check for the existence of DUPINT alarms against the Active SPE Duplication Interface circuit pack. If there are Active SPE DUPINT alarms, inform the customer that a reboot of the system may be required and determine a time at which a reboot may be done. At that time, complete the following steps:

1. Make sure that the translation card in the Active SPE has the most current translations. If it does not, issue **save translations spe-active** to put the most current translations on it.
2. Exchange the translation cards in the Active SPE and Standby SPE so that the Standby SPE contains the card with the most current translations.
3. Throw the SPE Select Switches on the TN772 Duplication Interface circuit packs to force an SPE-interchange so that the current Standby SPE becomes the new Active SPE. If SPE B is currently the Standby SPE, throw both SPE Select Switches to the right. If SPE A is currently the Standby SPE, throw both SPE Select Switches to the left.

If the Duplication Interface circuit pack actually severed the Memory Shadowing Link resulting in corruption of Standby SPE Memory, the SPE-interchange results in the new Active SPE performing a Reboot. However, if the defect in the Duplication Interface circuit pack did not sever the Memory Shadowing Link, the SPE-interchange results in the new Active SPE performing a Warm Start instead.

4. After the SPE-interchange is complete, log into the terminal. Follow the ["Circuit Pack Replacement Procedure"](#) for each circuit pack to be replaced in the new Standby SPE.

Upgrading SPE Circuit Packs

Determine which SPE is the Standby SPE by issuing the **status system** command. Look at the SPE and MODE fields in the upper left corner of the form. The Active SPE; it is labeled as "active." The other SPE is the Standby SPE and is labeled as either "standby," "maint," or "down."

Follow the ["Circuit Pack Replacement Procedure"](#) described later for each Standby SPE circuit pack to be upgraded.

When all Standby SPE circuit packs have been upgraded, force the Active SPE to become the Standby SPE as follows:

1. Issue the **status system** command from the terminal. Look at the SPE and MODE fields in the upper left corner of the form to determine the status of the Standby SPE. Recall that the Standby SPE is labeled as either “standby,” “maint,” or “down.”
2. If the Standby SPE is labeled as “maint,” continue issuing the **refresh spe-standby** command followed by the **status system** command until the Standby SPE is labeled “standby.”

⇒ NOTE:

It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled “standby” on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more.

3. If the Standby SPE is labeled “standby,” issue the **reset system interchange** command from the G3MT. After the SPE-interchange is complete, log into the terminal, issue the **status system** command, and verify that the SPEs have reversed roles.
4. Then, follow the “Circuit Pack Replacement Procedure” **for each circuit pack to be upgraded in the new Standby SPE.**

Circuit Pack Replacement Procedure

⇒ NOTE:

This procedure **does not** apply to the TN768 Tone-Clock circuit pack. Please refer to “TONE-BD”, “TONE-PT”, or “TDM-CLK” in [Chapter 10, “Maintenance Object Repair Procedures”](#) for the procedure to replace the Tone-Clock circuit pack.

⇒ NOTE:

See the flowchart of the procedure for installing or replacing Standby SPE Circuit Packs In Duplication Option Systems at the end of this section, for use as a circuit pack replacement maintenance aid.

The following procedure involves throwing the SPE Select Switches to hard-select the current Active SPE. After completing the circuit pack replacement procedure, verify that the SPE Select Switches have been returned to the AUTO position both by noting their position and by noting that the SPE Select Switch LEDs on the TN772 Duplication Interface circuit packs are not on.

1. Throw the SPE Select Switches, **one at a time**, to force selection of the current Active SPE. If SPE B is currently the Active SPE, throw both SPE Select Switches, **one at a time**, to the up position. If SPE A is currently the

Active SPE, throw both SPE Select Switches, **one at a time**, to the down position. Throwing the SPE Select Switches automatically disables shadowing.

 **NOTE:**

Do not remove power before proceeding with step 2. All PPN Control Carriers used in High or Critical Reliability Systems (A slot for the Duplication Interface circuit pack identifies these carriers.) have staggered pins to support the hot plug-in of circuit packs.

2. Unseat the Standby SPE Processor circuit pack. (It is not necessary to entirely remove the Standby SPE Processor circuit pack from its slot.)
3. If the circuit pack to be replaced is the TN772 Duplication Interface in the A carrier, continue with this step. Otherwise, proceed to Step 4.

Issue the **status system** command from the terminal, and check the status of the Tone-Clock in the 1B carrier:

- a. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "in" (that is, in service) and the SYSTEM CLOCK and SYSTEM TONES fields indicate that it is "active," proceed to Step 4.
- b. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "in" (that is, in service) but the SYSTEM CLOCK and SYSTEM TONES fields indicate that it is "standby," then check the Error Log for an active Error Type 3329 against the 1B TONE-BD by issuing the **display error** command. If this error exists, proceed to Step 4.

 **NOTE:**

Error Type 3329 implies that the Tone-Clock circuit pack probably cannot provide system clocks and an attempt to set the system clocks to this circuit pack would result in a **reset system 2** of the system. When the 1A Duplication Interface circuit pack is replaced, however, the system experiences a loss of clock, and a **reset system 2** occurs.

If an active Error Type 3329 is not logged against the 1B TONE-BD, issue the **set tone-clock 1B** command from the G3MT terminal to make the 1B carrier Tone-Clock active. Verify that the switch occurs by issuing the **status system** command and checking that the SERVICE STATE, SYSTEM CLOCK and SYSTEM TONES fields are now "in" and "active." Proceed to Step 4.

 **NOTE:**

If the 1B Tone-Clock circuit pack is defective the switch may have failed and a **reset system 2** may have occurred. In this case, proceed to Step 4. However, the system experiences a loss of clock and another **reset system 2** when the 1A Duplication Interface circuit pack is replaced.

- c. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is “out” (that is, out-of-service), refer to the TONE-BD (Tone-Clock circuit pack), TONE-PT (Tone Generator), and TDM-CLK (TDM Bus Clock) Maintenance documentation in [Chapter 10, “Maintenance Object Repair Procedures”](#), to restore it to service. Proceed to Step 4 regardless of whether or not the attempt to restore the 1B Tone-Clock to service was successful.

 **NOTE:**

If the 1B Tone-Clock was not successfully restored to service, the system experiences a loss of clock, and a **reset system 2** when the 1A Duplication Interface circuit pack is replaced.

4. If the circuit pack to be replaced is the TN772 Duplication Interface, throw the SPE Select Switch of the replacement Duplication Interface circuit pack to the same position as the SPE Select Switch on the Duplication Interface circuit pack that was removed.

If the Standby Processor is not being replaced Install the replacement circuit pack and reinsert the Standby SPE Processor circuit pack.

- a. If the circuit pack that was replaced was the TN772 Duplication Interface in the A carrier, the G3MT terminal is logged off. Log in to the Manager I terminal and proceed to Step 7.
5. If the circuit pack to be replaced is a TN790 Standby SPE Processor circuit pack loaded with the same software as loaded in the Active Processor or is a Standby SPE Processor circuit pack, install the circuit pack and proceed to Step 7.
6. If the circuit pack to be replaced is a TN790 Standby SPE Processor circuit pack and the software is being loaded from the generic program card, continue with the following steps:

 **NOTE:**

The TN790 must have the same number of SIMMs as the replaced circuit pack.

- a. Insert the generic program card into the Active SPE. Issue the **list configuration software-versions** command. If the software matches and the UPDATE FILE Identifier displays **none**, continue with this procedure. *Replace the translation card in the Active SPE.*
- b. Insert the generic program card into the Standby SPE.
- c. Install the TN790 Standby Processor circuit pack. When the Standby Processor starts to initialize and detects the program card, it does a software upgrade and displays the progress of this upgrade on the terminal.
- d. When prompted, replace the program card in the Standby SPE with the translation card. The Standby SPE boots up with the translation.

 **NOTE:**

Perform this operation within two minutes. Otherwise the Standby SPE will boot up without translations. However, it will recover the translations when the Active SPE enables memory shadowing to the Standby SPE.

- e. At the prompt **REPLACE TRANSLATION MEM-CARD ON <ACTIVE SPE> WITH SOFTWARE MEM-CARD**, wait 3 minutes for the Standby SPE to initialize before proceeding to next step.
 - f. Issue the **list configuration software-versions long** command to ensure that both SPEs are running identical software. Use the next step if the this command does not display the software versions, otherwise skip the next step.
 - g. Issue the **busyout spe-standby** command followed by the **release spe-standby** command to force the Standby SPE into a mode to accept the **list configuration software-versions long** command. Wait 5 minutes for the Standby SPE to initialize and issue the **status system 1st-cabinet** command. The Standby SPE failed to initialize if the Standby SPE Mode is **down**. If the Standby SPE Mode is **maint/init** or **maint/entering**, execute the **busyout spe-standby** and **release spe-standby** command up to 2 more times. If this step does not succeed, try this procedure again.
7. Issue the **status system 1st-cabinet** command. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include **test spe-standby**, **test duplication-interface**, and **test shadow-link**. Use the next step if the allowed test commands are not accepted, otherwise skip the next step.

 **CAUTION:**

If the Duplication Interface circuit pack is being tested, Test #278 fails because the SPE Select Switches are thrown.

8. Issue the **busyout spe-standby** command followed by the **release spe-standby** command to force the Standby SPE into a mode to accept the **test commands** attempted in the previous step. Wait 5 minutes for the Standby SPE to initialize and issue the **status system 1st-cabinet** command. If the Standby SPE failed to initialize if the Standby SPE Mode is **down**. If the Standby SPE Mode is **maint/init** or **maint/entering**, execute the **busyout spe-standby** and **release spe-standby** command up to 2 more times. If this step does not succeed, try this procedure again.
9. If other Standby SPE circuit packs are to be replaced, return to Step 2.
10. Move each SPE Select Switch back to the AUTO position. If any of the TN777B Network Control or the Processor circuit packs were replaced, please refer to the ["Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs"](#) section.

WARNING:

Move only one SPE Select Switch at a time. DO NOT move both switches at the same time.

WARNING:

If the Active SPE has alarms in it, an SPE-interchange may occur after moving each SPE Select Switch back to the AUTO position.

Maintenance activity is performed automatically on the Standby SPE after the SPE Select Switches are returned to their AUTO positions in Step 10. This can be verified by issuing the **status system** command and noting that the Standby SPE is labeled as "maint." It may take up to 5 minutes for this activity to begin. The maintenance activity itself takes from 10 to 30 minutes to complete.

NOTE:

The time required for the maintenance activity to finish depends on the number of TN765 Processor Interface circuit packs, the number of administered ports on the Processor Interface circuit packs, the number of administered data channels on the TN777B Network Control circuit pack, and the current load on the system.

Verify the completion of the maintenance activity by issuing the **status system 1** command and noting whether the Standby SPE is labeled as "standby."

Although not recommended at this stage of the procedure, the maintenance activity on the Standby SPE can be preempted using the **refresh spe-standby** command. To preempt the maintenance activity, continue issuing the **refresh spe-standby** command followed by **status system 1** command until the status system form shows that the Standby SPE is labeled "standby."

It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more.

If the **status system 1** command continues to show SPE alarms, issue the appropriate command(s) from the G3MT terminal to test these alarmed MOs.

After Step 10, if the Active SPE contains more severely defective circuit packs than the Standby SPE, an SPE-interchange may occur. The presence of alarms in the Active and Standby SPE can be verified by issuing the **status system** command. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If the Active SPE has alarms in it, an SPE-interchange may occur. The occurrence of the SPE-interchange can be verified by issuing the **status system** command to determine which SPE is now the Active SPE.

Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs

After **all** affected circuit packs have been replaced, if the replaced circuit packs include the TN777B Network Control circuit pack(s), the TN778 Packet Control circuit pack(s), or the Processor circuit pack(s), additional testing is required to ensure that the new circuit packs are healthy. This testing must be done on these circuit packs when they are located in the Active SPE. Issue the **status system** command to determine which SPE is currently the Active SPE and determine the SPE, Active or Standby, in which each replaced Network Control, Packet Control, and/or Processor circuit pack resides.

If any of the replaced circuit packs are located in the Active SPE, test it by issuing the **test network-control [a | b]**, **test packet-control [a | b]**, or **test processor [a | b]** command, as appropriate. If any tests fail or abort, refer to the SW-CTL (Switch Control), DATA-CHL (Network Control Data Channel), PKT-CTRL (Packet Control Circuit Pack), DATA-BD (Network Control Circuit Pack), or PROCR, and PR-MAINT (Maintenance/Tape Processor) Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#), as appropriate.

If any of these circuit packs are located in the Standby SPE, force the Standby SPE to become the Active SPE as described in "Upgrading SPE Circuit Packs." However, before the Standby SPE is made to become the Active SPE, the replaced circuit pack should first be tested while on the Standby SPE. Then, test these circuit packs (that are now located in the Active SPE) by issuing the **test network-control [a | b]**, **test packet-control [a | b]**, or **test processor [a | b]** command, as appropriate. If any tests fail or abort, refer to the SW-CTL (Switch Control), DATA-CHL (Network Control Data Channel), DATA-BD (Network Control Circuit Pack), PKT-CTRL (Packet Control Circuit Pack), or PROCR, and PR-MAINT (Maintenance/Tape Processor) Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#), as appropriate.

WARNING:

Before leaving the system, verify that the SPE Select Switches have been returned to their proper position. The switches should be in the AUTO position and the SPE Select Switch LEDs should be off on both the TN772 Duplication Interface circuit packs.

See the following flowchart, [Figure 6-1](#), [Figure 6-2](#) and [Figure 6-3](#), for the procedure for installing or replacing Standby SPE Circuit Packs in Duplication Option System.

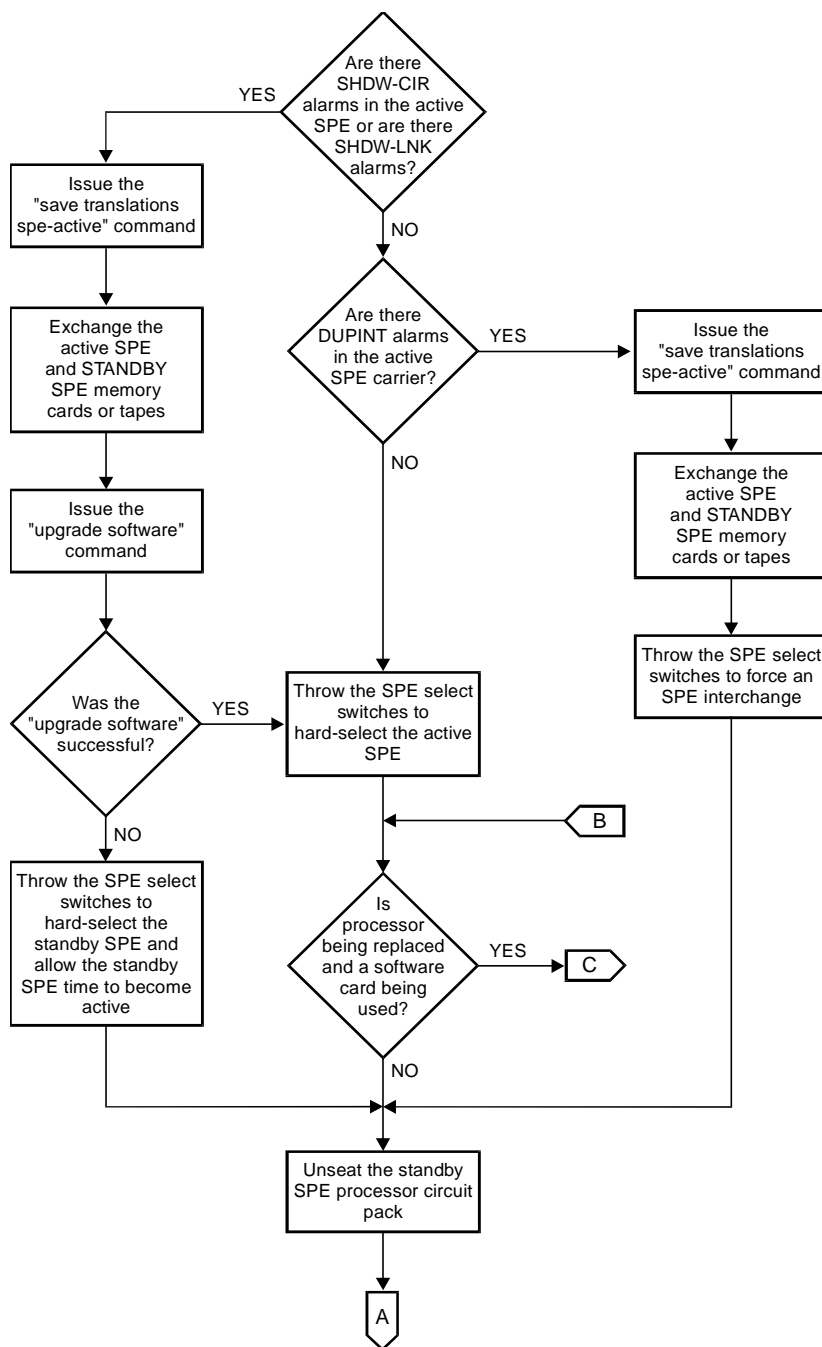

Figure 6-1. Page 1 Procedure for Replacing Standby SPE Circuit Packs

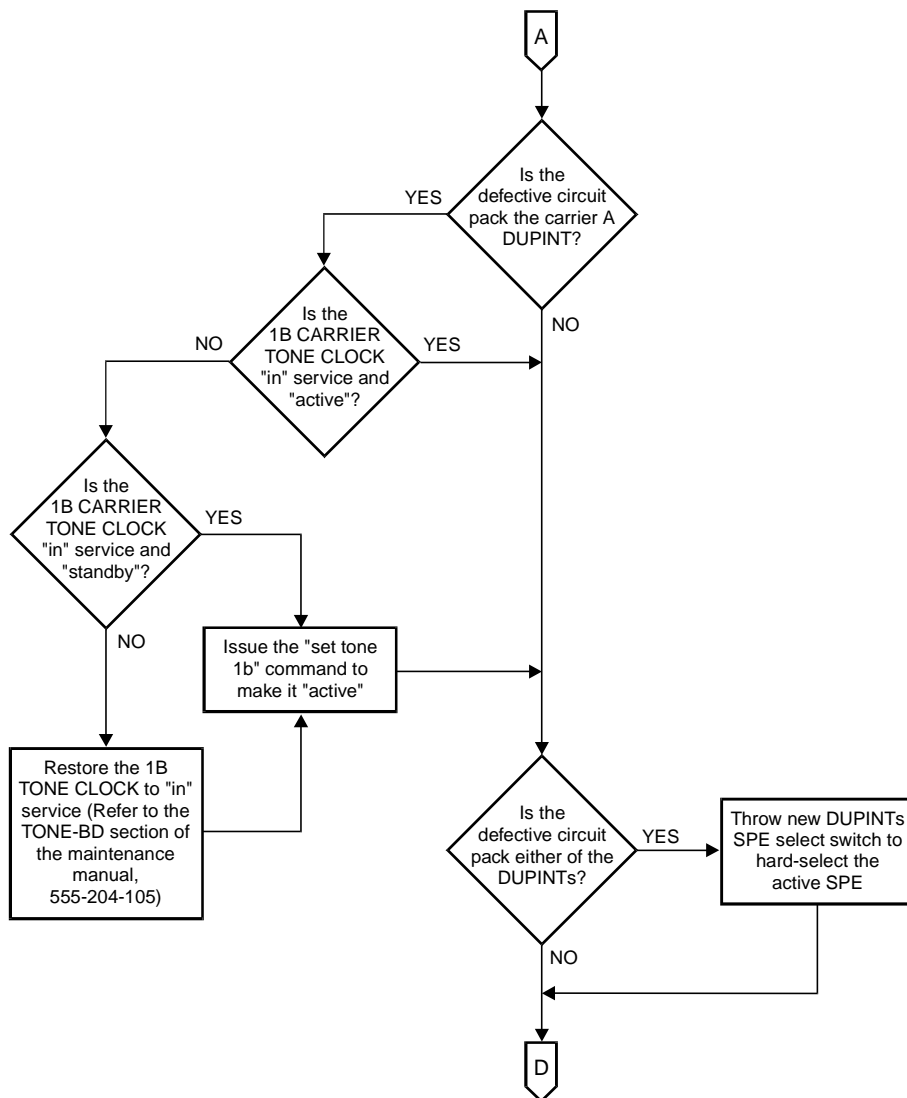

Figure 6-2. Page 2 Procedure for Replacing Standby SPE Circuit Packs

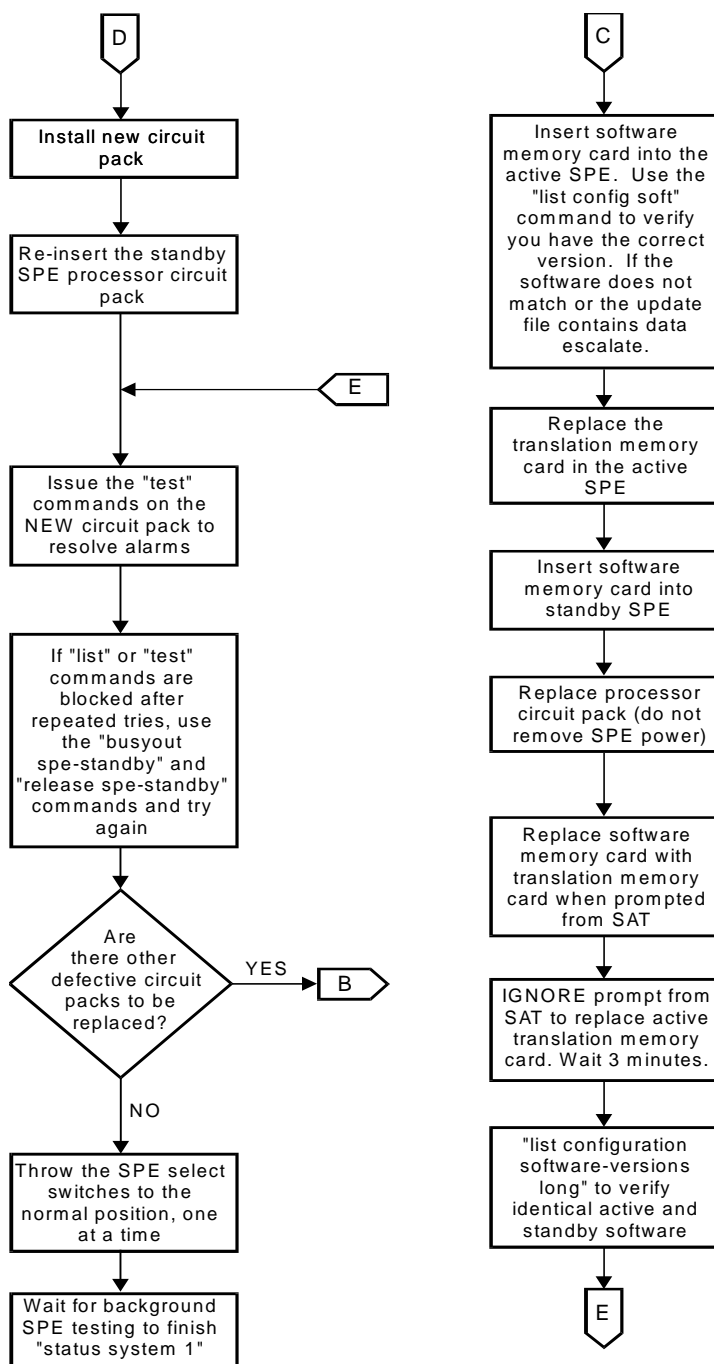

Figure 6-3. Page 3 Procedure for Replacing Standby SPE Circuit Packs

Procedure for Installing/Replacing the Inter-Cabinet Cable

The Inter-Cabinet Cables (ICCs) are physically located on the back of the cabinet behind the panels and between the A control cabinet and the B control cabinet. The panels must first be opened to see the ICCs.

WARNING:

Damage can be done to the Inter-Cabinet Cables during removal or installation. Follow the guidelines listed below to minimize the possibility of damage to the cables and later need of replacement.

To remove ICC-A, ICC-B, or ICC-C:

1. Remove power from the system. Refer to the [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
2. Grasp the cable connector, not the cable itself. Attempting to remove a cable by pulling on the cable itself can damage the cable-to-connector interface.
3. Pull the cable straight out. Pulling the connector from the backplane at an angle can bend the backplane pins.
4. Push the ICC connector onto the insulated sleeves.

CAUTION:

The pins should not show through the back of this connector. If they do, they ICC may be shorted out.

The only way to check the connector-cable-connector integrity is with a continuity test.

To re-install ICC-A, ICC-B, or ICC-C:

1. Verify that the backplane pins are not bent. If any are bent, they must be straightened or replaced before continuing.
2. Align the ICC connector with the backplane pins and push partially into place.
3. Use a dental mirror and light to view the back sides of the connector. Determine that all 50 backplane pins are seated correctly in the ICC connector.
4. Push the ICC connectors fully onto the insulated sleeves. The pins should not show through the back of the connectors. If the pins show through, the ICC may be shorted out.

Blocking Standby SPE Maintenance Activities for System Testing

Sometimes it is necessary to block Standby SPE maintenance activities so that system technician commands that test Standby SPE components can be conducted without being blocked with the G3MT terminal message line "Standby SPE busy with another task; for information use 'status system'." To block Standby SPE maintenance activities, perform the steps listed below.

WARNING:

The following procedure involves throwing the SPE Select Switches to hard-select the current Active SPE. After completing the circuit pack replacement procedure, verify that the SPE Select Switches have been returned to the AUTO position both by noting their position and by noting that the SPE Select Switch LEDs on the TN772 Duplication Interface circuit packs are not on.

1. Throw the SPE Select Switches (on the TN772 Duplication Interface circuit packs) to force selection of the current Active SPE. If SPE-B is currently the Active SPE, throw both SPE Select Switches to the right. If SPE-A is currently the Active SPE, throw both SPE Select Switches to the left.
2. Issue the **status system 1st-cabinet** command from the G3MT terminal. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include test spe-standby, test duplication-interface, and test shadow-link. Use the next step if the allowed test commands are not accepted, otherwise skip the next step.

CAUTION:

If the Duplication Interface circuit pack is being tested, Test #278 fails because the SPE Select Switches are thrown.

3. Issue the busyout spe-standby command followed by the release spe-standby command to force the Standby SPE into a mode to accept the **test commands** attempted in the previous step. Wait 5 minutes for the Standby SPE to initialize and issue the status system 1st-cabinet command. If the Standby SPE failed to initialize if the Standby SPE Mode is down. If the Standby SPE Mode is **maint/init** or **maint/entering**, execute the busyout spe-standby and release spe-standby command up to 2 more times. If this step does not succeed, try this procedure again.
4. Move each SPE Select Switch back to the AUTO position.

WARNING:

Move only one SPE Select Switch at a time. DO NOT move both switches at the same time.

Maintenance activity is performed automatically on the Standby SPE after the SPE Select Switches are returned to their AUTO positions in Step 4. This can be verified by issuing the **status system** command and noting that the Standby SPE is labeled as "maint." The maintenance activity takes from 10 to 30 minutes to complete. (The time required for the maintenance activity to complete depends upon the number of TN765 Processor Interface circuit packs, the number of administered ports on the Processor Interface circuit packs, the number of administered data channels on the TN777B Network Control circuit pack, and the current load on the system.) The completion of the maintenance activity can be verified by issuing the **status system** command and noting whether the Standby SPE is labeled as "standby."

Although not recommended at this stage of the procedure, the maintenance activity on the Standby SPE can be preempted using the **refresh spe-standby** command. To preempt the maintenance activity, continue issuing the **refresh spe-standby** command followed by **status system** command until the status system form shows that the Standby SPE is labeled "standby."

It **may** be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. This **does not include** cases where the command completes with the G3MT terminal message line errors "Refresh not successful; use 'display errors' to check for STBY-SPE errors" or "Cannot interrupt Standby SPE while entering maintenance mode; please try later."

Issue the **refresh spe-standby** command once more.

LED Interpretation

General

The lighting and unlighting of LEDs indicates to the system user the status of various maintenance components in the system. LEDs are located on the attendant console, on all circuit packs in the switch cabinets and, optionally, on customer-designated voice terminals. The following LEDs are included in the system:

- Processor circuit pack and maintenance circuit pack LEDs
- Duplication interface circuit pack LEDs
- Attendant console LEDs
- Carrier power unit LEDs
- Power distribution unit LEDs
- Control and port circuit pack status LEDs

Processor and Maintenance Circuit Pack LEDs

The front panels of the Processor circuit pack and the Maintenance circuit pack are identical. Each has two groups of LEDs. One group indicates the status of the pack, and the other group (which includes the Major, Minor, and Warning alarms described previously) reflects maintenance conditions in the entire system (that is, the PPN and EPN cabinets). See [Figure 7-1](#).

- Red (alarm)—the system has detected a fault in this circuit pack.

⇒ NOTE:

Alarms on the PROCR, PR-MAINT, MEMORY, and PR-MEM MOs are indicated by the red LED on the Processor circuit pack.

- Green (test)—the system is running tests on this circuit pack.

⇒ NOTE:

On the Standby Processor circuit pack, green means that the Standby Switch Processing Element (SPE) is not refreshed (that is, it is in Maintenance or Down Mode).

⇒ NOTE:

On the Maintenance circuit pack, the green LED may blink very faintly once per second. This is the normal operating state of the Maintenance circuit pack. The faint blink is due to a once-per-second self-test executed by the Maintenance circuit pack.

- Yellow (busy)—this circuit pack is in use. In a high or critical reliability system, the yellow LED is always off for the Standby Processor and Memory circuit packs even when in Maint mode.
- MAJOR ALARMS (red)
- MINOR ALARMS (red)
- WRNG (warning) ALARMS (yellow)
- ACK (acknowledgment) (green)—indicates Major or Minor alarms have been reported to INADS
- EMERGENCY TRANSFER (red)—indicates emergency transfer has been invoked

⇒ NOTE:

If the AC power cord is unplugged from the control cabinet, the emergency transfer feature invokes, however the EMERGENCY TRANSFER LED (red) is not lit due to loss of AC power.

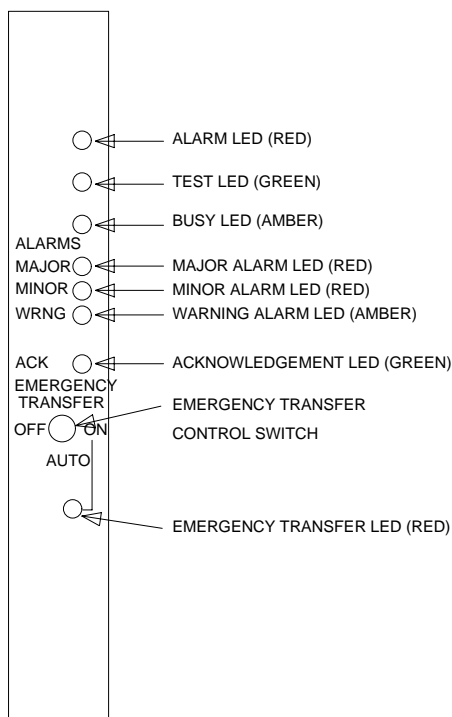

Figure 7-1. Indicators on Maintenance and Processor Circuit Packs

Duplication Interface circuit pack LEDs

In a High or Critical Reliability system, there are two Duplication Interface circuit packs. One is located in carrier A and one in carrier B of the PPN. Each circuit pack has two groups of LEDs. The top three have the traditional function of indicating the status of the pack. The LED located at the bottom of the faceplate directly beneath the SPE AUTO switch is labeled **OVERVERRIDE**. Under normal operating conditions, the SPE AUTO switch is in the AUTO (center) position (see [Figure 7-2](#)). This means that the system controls which SPE is active. However, there will be times (during maintenance activity, for example) when you, the technician, may choose to manually override the SPE selection function. To override system selection of the Active processor, move the SPE Select switches one at a time on *both* Duplication Interface circuit packs from the AUTO position

to either the "A" position or the "B" position. Thus, when both SPE Select switches have been moved to either "A" or "B," the OVERRIDE LED turns red and lights steadily.

NOTE:

Failure to move both SPE Select switches to the same position causes the system to retain control of processor selection.

To return control of the SPE selection to the system, return the SPE Select switches on both Duplication Interface circuit packs to the AUTO position (one at a time to avoid accidentally selecting the other SPE). The OVERRIDE LED goes dark.

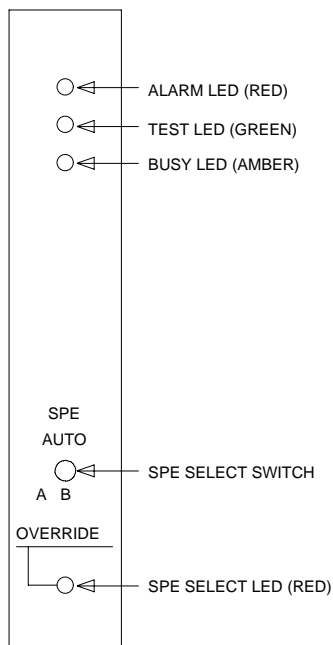

Figure 7-2. Duplicating Interface Circuit Pack Indicators

Attendant console LEDs

The console has two red LEDs, labeled ALM and ACK, on the left side of the dial. The left LED lights steadily when there is a Major or Minor alarm at the switch cabinet. The right LED lights steadily if the alarm has been successfully reported to INADS. If the system is unable to report the alarm to INADS, the LED flashes; signaling the attendant to call INADS and report the alarm.

Cabinet power unit LEDs

For a description of Cabinet Power Unit LEDs, refer to “AC-POWER” for AC-Powered Systems and “DC-POWER” for DC-Powered Systems in [Chapter 10, “Maintenance Object Repair Procedures”](#).

Power Distribution Unit LEDs

For a description of Power Distribution LEDs, refer to “AC-POWER” for AC-Powered Systems and “DC-POWER” for DC-Powered Systems in [Chapter 10, “Maintenance Object Repair Procedures”](#).

Control and port circuit pack status LEDs

Each circuit pack has three LEDs on the front panel visible at the front of the carrier. On all circuit packs, except the TN736 Power Unit, the LEDs indicate:

1. Red (alarm) — If the circuit pack is communicating with the system, the system has detected a fault in this circuit pack. An on-board alarm for this circuit pack is displayed in the Alarm Log.

The circuit pack also lights this LED when either the circuit pack has not yet initialized communication with the system or when the circuit pack loses contact with the system and stops functioning (circuit pack is said to be “in reset”). In these cases, there may not be an alarm in the Alarm Log. To determine if the red LED is lit because the circuit pack is not in contact with the system, issue the **list configuration board PCSS** command, where PCSS refers to the slot containing this circuit pack. If the system does not detect the circuit pack, this command returns “Identifier not assigned” or “no board.”

If the circuit pack has just been inserted, the system may still be initializing the circuit pack. If, after 5 minutes, the circuit pack still has not initialized communications with the system, check the MO for any special instructions (for example, EPN Maintenance circuit pack can stop EXP-INTF circuit pack from initializing). If the MO does not provide the needed information, perform the following steps:

- Check the Error Log for TONE-BD and TDM-BUS errors. Enter **test tdm P** where P is the port network containing the relevant slot. Refer to “Restarting Nonfunctioning Port Circuit Packs” in [Chapter 10, “Maintenance Object Repair Procedures”](#) in the general description of the “TDM-BUS”. Enter **test tone-clock PC**, where P is the network containing the relevant slot, and C is the carrier containing the relevant slot. Follow appropriate sections for any “TONE-BD” and “TDM-BUS” errors.
- Reseat the suspect circuit pack.

WARNING:

Reseating some circuit packs may be very destructive (for example, Control Carrier circuit packs.)

Wait 5 minutes. Then issue the **list configuration board PCSS** command. If the result indicates that the system still has not registered the circuit pack, go to next step.

- Try to insert the circuit pack into a different slot and try to insert a different circuit pack into the suspect slot (provided the maintenance documentation for this circuit pack does not warn against either of these actions).
 - If the system seems to be functioning correctly, but the circuit pack does not start communicating with the system, replace the circuit pack.
2. Green (test)—the system is running tests on this circuit pack.
 3. Yellow (busy)—indicates that the circuit pack is in use.

NOTE:

A port circuit pack also lights its red LED when it performs initialization tests (for example, when the circuit pack is initially inserted into the system). If all initialization tests pass, the red LED is turned off. If any initialization tests fail, the red LED remains lighted and the circuit pack is not placed into service.

Packet circuit packs such as the TN556 ISDN BRI-Line and TN570 Expansion Interface perform extensive initialization tests and light both the red and green LEDs during that testing.

During the various states of operation (start-up testing, normal operation, circuit failure, and so forth) circuit pack status LED indications appear as shown in [Table 7-1](#).

Table 7-1. Circuit Pack Status LEDs

Equipment Type	LED	Description
Port Circuit Packs	Red	On briefly during power up, circuit pack reseating, resetting, and system reset. Steadily on if circuit pack fails start-up test or fails while in use. Off during normal operation.
	Green	Briefly on during circuit pack testing following power up, circuit pack reseating, and system reset. On during periodic, scheduled, and system technician demanded testing. Off during normal operation.
	Yellow	On when any port in the circuit pack is in use, otherwise, off. The yellow LED on the TN771 Maintenance/Test circuit pack may blink. This has special meaning for systems using Packet Bus. Refer to "Packet Bus" for more information.

Continued on next page

Table 7-1. Circuit Pack Status LEDs — Continued

Equipment Type	LED	Description
Control Circuit Packs	Red	On briefly during power up and system reset. Steadily on if circuit pack fails start-up test or fails while in use. Off during normal operation.
	Green	On briefly during board testing following power up and system reset. Also on during periodic, scheduled, and system technician-demanded testing. Off during normal operation.
	Yellow	<p data-bbox="375 517 568 544">Network Control</p> <ul data-bbox="388 562 1050 700" style="list-style-type: none"> <li data-bbox="388 562 924 589">■ Lit when one of the data channels is in use <li data-bbox="388 611 1050 700">■ On the TN777B Network Control circuit pack, a fourth yellow LED with the label “Card in use” is lit when the translation card is in use. <p data-bbox="375 723 498 750">Processor</p> <ul data-bbox="388 772 1097 974" style="list-style-type: none"> <li data-bbox="388 772 1097 861">■ Lit during processor initialization. Otherwise, off. <p data-bbox="375 1413 624 1440">Duplication Interface</p> <ul data-bbox="388 1462 1093 1614" style="list-style-type: none"> <li data-bbox="388 1462 1093 1614">■ Lit steady on the Active SPE and dark during normal operation on the Standby SPE. Exception: Duplication Interface Circuit Pack A has the yellow LED lit steady if Tone/Clock Circuit Pack 1B is active, regardless of which SPE is active and which is standby.

Maintenance Commands and Trouble-Clearing Aids

8

For Maintenance Objects and Maintenance Commands for the DEFINITY Wireless Business System (DWBS), refer to the appropriate maintenance documentation that accompanies the DWBS.

This chapter provides additional trouble-clearing information for resolving both system-alarmed and user-reported troubles. This chapter supplements the information found in [Chapter 10, "Maintenance Object Repair Procedures"](#). The information consists of using the maintenance commands as trouble-clearing aids. The maintenance commands are used to control, test, and obtain information associated with maintenance objects (MOs). The commands require the use of the administration terminal or remote Initialization and Administration System (INADS) interface (a valid login and password to perform maintenance are required).

In this chapter, the commands are first identified and organized into categories. Thereafter, each command is described individually.

busyout access-endpoint

This command is destructive.

This command busysout a specified access endpoint.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout access-endpoint	<i>extension</i>	Extension number of access endpoint (per dial-plan) Examples: busyout access-endpoint 25012 busyout access-endpoint 77868	init inads craft nms	none	See below

Feature Interactions

- If there is an active call on the specified access endpoint, this command causes the call to drop.

Output

The following example shows the output for the **busyout access-endpoint 22502** command and assumes that access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6. The responses display on a test-by-test basis with one line of data for each test result.

```

busyout access-endpoint 22502                                SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
01C1101   WAE-PORT            22502     PASS
01C1102   WAE-PORT            22502     PASS
01C1103   WAE-PORT            22502     PASS
01C1104   WAE-PORT            22502     PASS
01C1105   WAE-PORT            22502     PASS
01C1106   WAE-PORT            22502     PASS

Command Successfully Completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	Name of maintenance object (WAE-PORT = wideband access endpoint; TIE-DS1 = single port access endpoint)
Alt. Name	The alternate way of identifying the maintenance object - the extension number of the access endpoint.
Result	Test result: Pass, Fail, Abort
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout board

This command puts all the ports associated with the specified access endpoint in a maintenance busy (craft busy) state. No periodic or scheduled tests are performed on the busied out access endpoint ports until they are released. When the access endpoint ports are maintenance busy, the access endpoint is removed from active service on the switch, meaning that no call processing activity can include the busied objects because terminals on the administered

ports do not receive dial-tone. Warning alarms are generated on each busied out port in the access endpoint. The **release access-endpoint** command returns all the ports associated with the specified access endpoint to operation.

WARNING:

This command is service disrupting and may cause extraneous alarms.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout board	<i>location</i>	Board address (PCSSpp) Examples: busyout board 01c11 busyout board 02c15	init inads craft	none	None

Output

The following example shows the output from the **busyout board 1c07** command, and assumes that board in cabinet 1, carrier c, slot 7 is an analog board with three administered ports. The responses display on a test-by-test basis with one line of data for each test result.

```

busyout board 01c07                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
01c07     ANL-BD              PASS
01c0702   ANL-LINE            PASS
01c0701   ANL-LINE            51001     PASS
01c0703   ANL-LINE            PASS

Command successfully completed
    
```

Field descriptions

Port Port address (cabinet-carrier-slot-circuit)

Maintenance Name The name of maintenance object

Alt. Name	Alternate way to identify maintenance objects.
If the Object is	The field contains
station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
private CO line	P/xxx (where xxx = private CO line group number)
Result	Test result: Pass, Abort, or Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout cdr-link

This command busyouts a maintenance object associated with the specified call detail recording (cdr) link.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout cdr-link	<i>link-id</i>	Link identifier (primary or secondary) Examples: busyout cdr-link primary busyout cdr-link secondary	init inads craft nms	Primary	None

Output

The following example shows the output from the **busyout cdr-link primary** command.

```

busyout cdr-link primary          SPE A
                                COMMAND RESULTS
Port      Maintenance Name  Alt. Name  Result  Error Code
1         CDR-LNK           PASS
Command successfully completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit); 1 = primary, 2 = secondary link
Maintenance Name	The name of maintenance object

Alt. Name	Alternate way to identify maintenance objects.
If the Object is	The field contains
station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
private CO line	P/xxx (where xxx = private CO line group number)
Result	Test result: Pass, Abort, or Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout data-module

This command puts the specified data module in a maintenance busy state, even uninstalled data modules. No periodic or scheduled tests is performed on the busied out data module or data channel until it is released and no call processing can be executed on the data modules or over the data channels. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The **release data module** command returns the specified data module (or data channel) to operation.

On duplicated systems, a busyout of a Network Control Data Channel (DATA-CHL) or a Processor Interface Port Data Channels (PI-PT) are preserved across SPE interchanges. The data channel extension must be released before the data channel can be brought back into service.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout data-module	<i>extension</i>	Extension number (per dial-plan) Example: busyout data-module 31300	init inads craft nms	None	None

Output

The following example shows the output from the **busyout data-module 300** command.

```

busyout data-module 300                                SPE A
                                                    COMMAND RESULTS
Port      Maintenance Name  Alt. Name  Result      Error Code
01C1103   DIG-LINE             300        PASS
Command successfully completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) or the data channel number
Maintenance Name	The name of maintenance object
Alt. Name	Alternate way to identify maintenance objects.
	If the Object is The field contains
	station extension
	trunk xxx/yyy (where xxx = trunk group number and yyy = member number)
	private CO line P/xxx (where xxx = private CO line group number)
Result	Test result: Pass, Abort, or Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout journal-printer

This command places the maintenance object associated with a specified pms-log or wakeup-log link in a maintenance busy state. No periodic or scheduled tests are performed on the busied out maintenance object until it is released. Also, no activity occurs over the links (for example, no data is transferred to the printer) and the link drops. Warning alarms are generated (Error type 18) on each busied out maintenance object, so that INADS can access object status. The **release journal-printer** command will return the object to operation.

A link is comprised of several components: a far-end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a

transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For general information on journal printer links, refer to the description of the [“busyout pms-link”](#) command.

For information on what a journal printer is and does, refer to the description of the [“status journal-link”](#) command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout journal-printer	pms-log	Link to pms (in output, port name for pms link =1)	init inads craft nms	None	See below
	wakeup-log	Link to the wakeup logging facility (in output, port name = 0) Examples: busyout journal-printer pms-log busyout journal-printer wakeup-log			

Feature Interactions

Maintenance of a particular component on a link sometimes interferes with the maintenance of the link itself. For example, maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, disable the attempted re-setup of a link with the busyout command and the link remains intact. If the link is already down, the busyout command stops periodic re-setup attempts on the link.

Output

The following example shows the output for the **busyout journal-printer wakeup-log** command.

```

busyout journal-printer wakeup-log                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
0         JRNL-LINK          PASS

Command successfully completed
    
```

Field descriptions

Port	Physical object port address: 0 = wakeup log, 1 = pms log
Maintenance Name	The name of the maintenance object
Alt. Name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout link

This command places maintenance objects associated with a specified link in a maintenance busy state. No periodic or scheduled tests are performed on the busied out maintenance objects until they are released. The link is marked out of service and is inaccessible to call processing. Warning alarms (error type 18) are generated on each busied out maintenance object, so that INADS can determine the state of the objects. The **release link** command reactivates the objects.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout link	<i>link-id</i>	Processor Interface circuit pack 1a1 or 1b1 = 1 – 4 Processor Interface circuit pack 1a2 or 1b2 = 5 – 8 Examples busyout link 1	init inads craft	none	none

Output

The following example shows the output from the **busyout link 1** command. The responses display on a test-by-test basis with one line of data for each test result.

```

busyout link 1                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
01C0301   PI-LINK

Command successfully completed
    
```

Field descriptions

Port	Port address represents link-id
Maintenance Name	The name of the busied out maintenance object
Alt. Name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout mis

This command places the management information system in the maintenance busy state. No periodic or scheduled maintenance is performed until it is released. When the object is busied out no call processing activity may be performed over the link. A warning alarm (error type 18) is generated on the busied out mis, so that INADS can determine its state. The command, **release mis**, reactivates the busied out mis.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout mis		Example: busyout mis	init inads craft cust rcust	None	None

Output

The following example shows the output from the **busyout mis** command. The responses display on a test-by-test basis with one line of data for each test result.

```

busyout mis                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
MIS

Command Successfully Completed
    
```

Field descriptions

Port	Not applicable
Maintenance Name	Name of busied out maintenance object: MIS
Alt. Name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout modem-pool

This command places specified installed and uninstalled modem pool groups or group members in the maintenance busy state. No periodic or scheduled tests are performed on the busied out modem pool groups or group members until they are released. When the object is maintenance busy it is deactivated (no call processing activity may include the busied object). A single group member can be busied out by specifying the group and member number. All members in a modem pool group can be busied out by specifying the modem pool group number. Warning alarms (error type 18) are generated on each busied out maintenance object, so that INADS can determine the state of the objects. The command, **release modem-pool**, reactivates the specified modem pool group or group member.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout modem-pool	group	Group number = 1 – 5	init inads craft	none	none
	member	Member number = 1 – 32 (a member is a pair of analog and digital line ports — two pair for integrated pool modem. Examples busyout modem-pool 1 busyout modem-pool 4/3			

Output

```

busyout modem-pool 1                               SPE B

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code

01C0701   MODEM-PT             PASS
01C0703   MODEM-PT             PASS

Command successfully completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	Name of busied out maintenance object: MODEM-PT
Alt. Name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout packet-control

This command places the packet-control circuit pack in a maintenance busy state, and tears down each point-to-point signaling link that terminates on this packet-control. No periodic or scheduled test is performed on the busied out packet-control until it is released. A warning alarm (error type 18) is generated on the busied out packet-control, so that INADS can determine the state of the object. The **release packet-control** command reactivates the board and initiates recovery on all point-to-point signaling links terminated on this packet-control.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout packet-control	<i>location</i>	Applies to duplicated configurations only - a carrier that contains packet-control in the system. Valid locations = 1A or 1B. Examples busyout packet-control 1A busyout packet-control 1B	init inads craft	simplex systems (optional) = cabinet 1, carrier A duplex systems = cabinet 1, carrier of choice.	See below

Feature Interactions

- In a duplicated system, the packet-control busyout of standby process complex is not allowed.
- When the packet-control in the active control complex is busied out, all connectivity across the Packet Bus is severed. Thus, all ISDN-BRI point-to-point signaling links that have been established through the active packet-control are torn down by the **busyout packet-control** command. The **release packet-control** command re-establishes all Packet Bus connectivity.

Output

The following example shows the output from the **busyout packet-control 1A** command. The responses display on a test-by-test basis with one line of data for each test result.

```
busyout packet-control 1A                               SPE A
                                                    COMMAND RESULTS
Port      Maintenance Name  Alt. Name  Result      Error Code
1A        PKT-CTRL              PASS
Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier)
Maintenance Name	Type of busied out maintenance object (PKT-CTRL).
Alt. Name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout pms-link

This command places all maintenance objects associated with a property management system link in the maintenance busy state. No periodic or scheduled maintenance is performed on the busied out maintenance objects until they are released. When the object is maintenance busy the object is deactivated (no call processing activity may include the busied object) and the

link is dropped. Warning alarms (error type 18) are generated on each busied out maintenance object, so that INADS can determine the state of the objects. The **release pms link** command reactivates the busied out objects on the link.

These links provide asynchronous data connections from switches to peripherals; they are composed of a:

- Far-end data module
- Simulated data channel on a NETCON board
- Manager that initiates and maintains the link
- Controller/protocol that services the link

For information on PMS, see the description of the [“status pms-link”](#) command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout pms-link		Example: busyout pms-link	init inads craft	none	See below

Feature Interactions

Maintenance of a particular component on a link sometimes interferes with the maintenance of the link itself. For example, maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, disable the attempted re-setup of a link with the busyout command and the link remains intact. If the link is already down, the busyout command stops periodic re-setup attempts on the link.

Output

The following example is a display of the **busyout pms-link** command.

```

busyout pms-link                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
-----
          PMS-LINK                PASS

Command Successfully Completed
    
```

Field descriptions

Port	Always blank
Maintenance Name	Name of maintenance object: PMS-LINK
Alt. Name	Not applicable.
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout port

This command places the specified port on a circuit pack in a maintenance busy state. No periodic or scheduled tests are performed on the busied out port until it is released. When the object is maintenance busy, it is deactivated (no call processing activity may include the busied object). Warning alarms (error type 18) are generated on each busied out maintenance object, so that INADS can determine the state of the objects. The **release port** command reactivates the administered port on a circuit pack at a specified location.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout port	<i>location</i>	Port location: PPsspp Examples: busyout port 01c1101 busyout port 02c1501	init inads craft	none	see below

Output

The following example is a display of the **busyout port** command.

```

busyout port 01C0701                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
01C0701   ANL-LINE                PASS

Command successfully completed
    
```

8 Maintenance Commands and Trouble-Clearing Aids
busyout pri-endpoint

8-15

Alt. Name	Alternate way to identify maintenance objects.
If the Object is	The field contains
station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
	private CO lineP/xxx (where xxx = private CO line group number)
Maintenance Name	Type of busied out maintenance object.
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout pri-endpoint

This command places all PRI endpoint ports (B-channels) associated with the specified PRI endpoint in a maintenance busy (system technician busy) state. No periodic or scheduled tests are performed on the busied out PRI endpoint ports until they are released. When the PRI endpoint port is maintenance busy it is deactivated (no call processing activity may include the busied object). Warning alarms are generated on each busied out port. The **release pri-endpoint** command reactivates all ports (B-channels) associated with the specified PRI endpoint extension and the switch attempts to negotiate with the far-end PRI terminal adapter to reactivate each PRI endpoint port (B-channel).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout pri-endpoint	<i>extension</i>	PRI endpoint extension number Examples: busyout pri-endpoint 25012 busyout pri-endpoint 77868	init inads craft nms	none	If active calls resides on specified PRI endpoints, the busyout command drops the call. Once the PRI endpoint is maintenance-busy, call attempts from far-end PRI terminal adapters are denied with a cause value 17.

Output

```

busyout pri-endpoint 22501                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
01B2001   PE-BCHL           22501     PASS
01B2002   PE-BCHL           22501     PASS
01B2003   PE-BCHL           22501     PASS
01B2004   PE-BCHL           22501     PASS
01B2005   PE-BCHL           22501     PASS
01B2006   PE-BCHL           22501     PASS

Command Successfully Completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	Type of busied out maintenance object: PE-BCHL
Alt. Name	Extension number of PRI endpoint
Result	Test result: Pass, Fail, Abort
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout sp-link

This command places the system printer link into a maintenance busy state. No periodic or scheduled maintenance is performed on the busied out system printer link until it is released. Warning alarms (error type 18) are generated on each busied out maintenance object, so that INADS can determine the state of the object. Placing the system printer link in a busyout state blocks access to the system printer. The **release sp-link** command reactivates the system printer link.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout sp-link		Examples: busyout sp-link	init inads craft	none	none

Output

```

busyout sp-link                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
SYS-PRNT

Command Successfully Completed
    
```

Field descriptions

Port	Not applicable
Maintenance Name	Type of maintenance object that is busied out: SYS-PRNT
Alt. Name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout spe-standby

This command raises the Fault Severity Level of the Standby SPE (see reference 5) of the standby Switch Processing Element (SPE) by raising a Warning Off-board alarm against STBY-SPE. Because a Warning Off-board STBY-SPE alarm is defined to have the highest Fault Severity of all alarms the affect the health of an SPE (refer to the Reset System MUS), the chance that an SPE interchange will occur is diminished, but does not guarantee that an SPE interchange will not occur. Once the standby SPE is busied out, an SPE interchange occurs if the standby SPE is hard selected with the SPE Select switches or the active SPE goes into SPE down mode. This command also stops any activity currently executing on the standby SPE and disables memory shadowing to the standby SPE. Periodic and scheduled testing cannot start on the standby SPE while it is busied out. The busyout state of the standby SPE and the STBY-SPE Warning alarm are maintained across a reset system 1 (Warm restart) and a reset system 2 (Cold 2 restart) but are removed after all other levels of restart.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout spe-standby		Examples: busyout spe-standby	init inads craft	none	See below

Feature Interactions

- When a busyout of the standby SPE is performed, the fault severity level of the standby SPE is set to the highest possible value and memory shadowing is turned off. This is done to reduce the probability that the system switches to the standby SPE. However, in some cases a “spontaneous” (hard) interchange of the SPEs may still occur.
- This command can be used as a mechanism to turn off memory shadowing of the standby SPE.
- If the standby SPE is in poor health (less than optimum), memory shadowing can not be disabled, or communication to the standby is impossible a busyout of the standby SPE are still successful.

Output

The following example is a display of the **busyout spe-standby** command.

```
busyout spe-standby                               SPE A

          COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
01B      STBY-SPE                PASS

Command successfully completed
```

Field descriptions

Port	Standby SPE cabinet and carrier location (01A or 01B)
Maintenance Name	Always STBY-SPE
Alt. Name	Always blank
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout station

This command places the installed and uninstalled administered voice terminal extension (station) in a maintenance busy state. No periodic or scheduled tests are performed on the busied out station until it is released. When the object is maintenance busy it is deactivated (no call processing activity can include the

busied object). Warning alarms (error type 18) are generated on each busied out maintenance object, so that INADS can determine the state of the objects. The command, **release station**, reactivates the specified voice terminal extension.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout station	extension	Extension number (per dial-plan) Examples: busyout station 10020 busyout station 32770	init inads craft	none	none

Output

The following example is a display of the **busyout station** command.

```

busyout station 1002                                SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
01C1102   DIG-LINE           PASS

Command successfully completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	Type of busied out maintenance object
Alt. Name	Alternate means to identify maintenance object: extension number
Result	Test result: Pass, Fail, Abort
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout tdm

This command places the specified tdm bus in a maintenance busy state. No periodic or scheduled tests are performed on the busied out bus until it is released. When the object is maintenance busy it is deactivated (no call processing activity may include the busied object). Warning alarms (error type 18) are generated on each busied out tdm bus, so that INADS can determine the state of the objects. The **release tdm** command reactivates the specified tdm bus.

8 Maintenance Commands and Trouble-Clearing Aids
busyout tone-clock

8-20

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout tdm	pn number	pn number = TDM bus Port Network number	init inads craft	none	If a bus is busied out, no calls are torn down; no new calls are set up. Dedicated tone time slots must be moved to another bus (the other half of the duplicated bus) before a busyout of a particular bus is allowed.
	bus	bus = "a" or "b" specifies desired half of TDM bus. Each 512 time slot TDM bus configures as two duplicate 256 time slot buses. This division allows duplication of control channels and dedicated tone time slots. "a" bus = the default control bus; "b" bus = the default tone bus. Examples: busyout tdm 1a			

Output

The following example is a display of the **busyout tdm** command.

```

busyout tdm port-network 1 bus a                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
PN 01A    TDM-BUS                PASS

Command successfully completed
    
```

Field descriptions

Port	Port address and associated TDM number and bus (PNA or PNB)
Alt. Name	Not applicable
Maintenance Name	Type of busied out maintenance object: TDM-BUS
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout tone-clock

This command places the specified tone/clock in a maintenance busy state. No periodic or scheduled tests are performed on the busied out object until it is released. When the object is maintenance busy it is deactivated (no call processing activity may include the busied object). Warning alarms (error type

18) are generated on each tone clock circuit pack busied out, so that INADS can determine the state of the objects. The command, **release tone-clock**, reactivates the specified tone/clock.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout tone-clock	location	Physical location (PC) Examples: busyout tone-clock 01c busyout tone-clock 03d	init inads craft	1 (one)	none

Output

The following example is a display of the **busyout tone-clock** command.

```

busyout tone-clock 1a                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code
01A      TONE-PT                PASS
01A      TDM-CLK               PASS
01A      TONE-BD                PASS

Command successfully completed
    
```

Field descriptions

Port	Tone/clock board address (cabinet-carrier)
Maintenance Name	Circuit pack name: TONE-PT, TDM-CLK, TONE-BD
Alt. name	Not applicable
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

busyout trunk

This command places the specified installed or uninstalled trunk group or trunk group member in a maintenance busy state. No periodic or scheduled tests are performed on the busied out trunk groups or trunk group members until they are released. When the object is maintenance busy it is deactivated (no call processing activity may include the busied object). A single group member can be busied out by specifying the group and member number. All members in a trunk group can be busied out by specifying the trunk group number. Warning

8 Maintenance Commands and Trouble-Clearing Aids
cancel hardware-group

8-23

Alt. Name	Alternate way to identify maintenance objects.
	If the Object is The field contains
	station extension
	trunk xxx/yyy (where xxx = trunk group number and yyy = member number)
	private CO line P/xxx (where xxx = private CO line group number)
Result	Test result: Pass, Abort, Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

cancel hardware-group

This command temporarily or permanently aborts the execution of a **test hardware-group** command. To resume testing, enter **resume hardware-group** or **test hardware-group**.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
cancel hardware-group		Examples: cancel hardware-group	init inads	none	See below

Feature Interactions

- Scheduled and Periodic Maintenance

When the **test hardware-group** command is entered, all activity related to scheduled background maintenance, periodic background maintenance, and data audits suspends for the duration of the **test hardware-group** command. All activity related to scheduled background maintenance, periodic background maintenance, and data audits restarts if the **test hardware-group** command is canceled.

- Status Hardware-group

The **status hardware-group** command displays the state of a canceled **test hardware-group** command as canceled.

change circuit-packs

This command allows users to administer circuit packs that are inserted into the system port, expansion control, and switch node carriers. It is used to configure the system when circuit packs are not physically inserted.

8 Maintenance Commands and Trouble-Clearing Aids
change circuit-packs

8-24

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
change circuit-packs	<i>cabinet number</i>	Cabinet number of the circuit packs Examples: change circuit-packs 1 change circuit-packs 2	init inads craft cust nms	1 (one)	none

Output

The following example shows the output from the **change circuit-packs 1** command (SCC) All five pages are shown here.

```
change circuit-packs 1                               Page 1 of 5

```

Field descriptions

Cabinet	Administered cabinet number
Cabinet Layout	Type of cabinet (single-carrier)
Carrier	In-use cabinet carrier
Carrier Type	Carrier function (port, processor, or expansion control)
Slot	Slot numbers (0 - 21).
Code	Circuit pack code (TN number) to identify the circuit pack type
Sfx	Lists the suffix, if applicable
Name	Alphanumeric circuit pack name

change synchronization

Each system contains a hierarchy of sources used for timing synchronization. DS1 inputs to the external stratum 3 clock affect stratum 3 synchronization hierarchy. Primary and secondary fields reflect Stratum 4 synchronization. If all fields are blank, the tone clock board within each PN provides timing for that PN.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
change synchronization		Examples: change synchronization change synch	init inads craft cust rcust bcms	none	DS1 interface, BRI trunk, or UDS1 board selected as either a primary or secondary synch source cannot be removed on the DS1 circuit pack administration form or the regular circuit pack administration form.

Output

The following example shows the output for the **change synchronization** command. "4" was entered in the stratum field.

```
change synchronization                               Page 1 of 1

      SYNCHRONIZATION PLAN

SYNCHRONIZATION SOURCE (circuit pack location)
  Stratum: 4
  Primary: _____ Secondary: _____
Location Name Slip      Location Name Slip

NOTE: DS1 and BRI trunk source will result in stratum 4, type II synchronization
```

The following output example shows the output for the **change synchronization** command. "3" was entered in the stratum field.

```
change synchronization                               Page 1 of 1

      SYNCHRONIZATION PLAN

SYNCHRONIZATION SOURCE (DS1 circuit pack location)
  Stratum: 3
  Port Network: 1
```

Field descriptions

Stratum: Current synchronization stratum (3, 4)

Primary: First choice system synchronization source (blank entry = no synchronization); field valid only if stratum 4 synchronization is specified.

- Secondary: Second choice system synchronization source (blank = no synchronization); valid if stratum 4 synchronization selected
- Location: Circuit pack location of all administered DS1 circuit packs (port network, carrier, and board slot)
- Name: User-defined name for the DS1 circuit pack (blank = no user-defined name assigned)
- Slip: If DS1 circuit pack has slip alarm, y; if not, n.
- Port Network: Display-only field specifying the port network that supplies synchronization through the tone clock circuit pack (valid for stratum 3 synchronization)

change system-parameters customer-options

All changes to the Customer Options form must be done at the init login level, which is challenged by Access Security Gateway.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
change system-parameters customer-options		Example: change system-parameters customer-options	init inads craft	none	none

Output

The following example shows the output from the **change system-parameters customer-options** command.

OPTIONAL FEATURES

```

Screen 8-1. Customer Options form (page 2 of 5)

change system-parameters maintenance

This command specifies and displays scheduled maintenance operations and maintenance support functions. It also activates and deactivates INADS alarm origination during repairs. To deactivate alarm origination:

1. Make a note of the current entries in the Alarm Origination and CPE Alarm fields so you can restore them later.
2. Change the Alarm Origination to OSS Numbers field to "neither."
3. Change the CPE Alarm Activation Level field to **none**.
4. If daily scheduled maintenance must remain idle during a maintenance procedure, set the Start Time field to a time after the session ends. If daily Scheduled Maintenance is running and needs to be deactivated, set the Stop Time field to one minute after the current time.
5. Press Enter and verify that the screen displays the message:

Command successfully completed

⇒ NOTE:

For earlier releases of system software, disable Cleared Alarm Notification and Restart Notification before submitting the form.

Field descriptions (page 1)

Operations Support Parameters

Product Identification	Identifies switch to an Operations Support System (OSS): 10-digit number starting with 1.
First OSS Telephone Number	Switch reports alarms first to the First OSS telephone number (for example, INADS or Trouble Tracker). The number must be obtained from the National Customer Support Center (NCSC) or the TSC. (# and * are not allowed in the telephone number.)
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the first OSS. (yes)
Second OSS Telephone Number	The switch reports alarms secondly to the second OSS telephone number. For example, INADS or DEFINITY SNMP. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. (# and * are not allowed in the telephone number.)
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the second OSS. (no)
Alarm Origination to OSS Numbers	Indicates one of four options for alarm origination (neither): <code>both</code> = Major and Minor alarms result in an automatic call to both administered OSS telephone numbers. <code>first-only</code> = Major and Minor alarms result in an automatic call to the first administered OSS number. <code>neither</code> = alarm origination does not occur; reports are not sent to either number. <code>second no-backup</code> = Major and Minor alarms result in an automatic call to the first administered OSS telephone number. If calling the first OSS telephone number fails four times, the switch calls the second administered OSS telephone number until calling the first OSS telephone number is successful.
	⇒ NOTE: Before Release 5, the name of this field is Alarm Origination Activated.
	If Alarm Origination is deactivated, Cleared Alarm Notification and Restart Notification deactivate, even though they may still be activate in the administration.
Cleared Alarm Notification	The switch originates calls to the OSS and sends an alarm resolution message once all previously-reported Major and Minor alarms are resolved. Activate Alarm Origination to enable Cleared Alarm Notification. (no)

8 Maintenance Commands and Trouble-Clearing Aids
change system-parameters maintenance

8-32

Restart
Notification

Enables the switch to originate calls to the OSS and report any system restarts caused by switch problems. Activate Alarm Origination to enable Restart Notification.

Suspension
Threshold

Some problems cause alarms to be generated and resolved repeatedly. To detect these problems, the switch suspends Cleared Alarm Notification when it has reported the specified number of Cleared Alarm notifications in a 24 hour period. A suspended Cleared Alarm Notification reactivates with a successfully-completed "logoff" command, a system reset, or when the threshold is changed. This field is irrelevant if Cleared Alarm Notification or Alarm Origination are disabled. (1-15)

Test Remote
Access Port

Indicates if remote access testing on the SYSAM circuit pack is active. This field should be set to **yes** when an INADS line is connected to the switch and a maintenance contract is in effect to maintain alarm origination capability.

If no equipment is connected to the remote access port, or if a trunk for remote access and alarm origination is not provided, running tests on the remote access port on the SYSAM results in test failures. This causes unnecessary maintenance alarms and allows potentially destructive tests to be run. To prevent this, set this field to **no**.

CPE Alarm
Activation
Level

Indicates the minimum level (Major, Minor or Warning) to activate Customer-Provided Equipment (CPE) alarm. If the level is **none**, the CPE does not activate for any alarm. (none)

 **NOTE:**

When the switch goes into Emergency Transfer, the CPE alarm activates regardless of the CPE Alarm Activation Level setting.

Packet Bus
Activated

If this field is set to **yes**, maintenance software assumes that a Packet Control circuit pack is installed. If packet endpoints (for example, ASAI, and/or BRI) are administered, and maintenance testing runs on both the Packet Control circuit pack and Packet Bus (set this field to **yes** after a packet control circuit pack is installed.). If a Packet Control circuit pack is not installed in the system, a major alarm is raised against the PKT-CTRL MO.

Change this field to **no** if no packet endpoints are administered, to ensure that no packet endpoints can be administered if the packet bus deactivated.

Set this field to **yes** after a Packet Control circuit pack is installed.

If a Packet Control circuit pack is not installed, then this field should be set to **no** (the only exception is system translations that do not have all required hardware). (no)

Customer Access
to INADS Port

To prevent customer login ID access to system administration and maintenance interface control, set this field to **no**. Lucent Technologies services has sole access to this field. (no)

Repeat Dial Interval (MMS) Number of minutes that the system must wait before attempting another call origination to an OSS. Lack of a far-end acknowledgment triggers the timer.

Scheduled Maintenance

An automated series of maintenance tests and operations runs daily according to the schedule and settings specified in the following fields

Table 8-1. Scheduled Maintenance Settings

Start Time	Hour and minute (24-hour notation) when daily scheduled maintenance starts
Stop Time	The hour and minute when scheduled daily maintenance ceases. If any daily maintenance operations are not completed by this time, the system notes its stopped sequence location and includes those operations during the next scheduled daily maintenance.
Daily Maintenance	This display-only field lists the standard test series run by maintenance software during daily maintenance.
Save Translation	Indicates days that translation data in memory automatically saves to the Mass Storage System disk and/or tape devices during scheduled maintenance. The operation saves to disk, then completes a backup to tape. Translation data saves to both SPEs, if systems have duplicated SPEs. (daily, days of the week, or no - prevents automatic saves)
Control Channel Interchange	Each port network has a pair of TDM busses (A and B). Each has a set of time slots dedicated to the control channel. One bus (at a time) carries the control channel in each PN. (daily, days of the week, or no - prevents interchanges). (no)
System Clocks Interchange	For High and Critical Reliability systems, this option initiates a Tone-Clock interchange in each port network possessing duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the originally-active Tone-Clock. This field indicates the days that interchanges occur. (daily, days of the week, or no). "No" prevents interchanges. (no)
	The system performs a Tone-Clock interchange, activating the stand by Tone-Clock. After the newly-active Tone-Clock circuit pack is tested, it provides system clocks for its native port network. Then the system interchanges to the originally active Tone-Clock circuit pack.
SPE Interchange	This field indicates the days SPE interchanges execute during scheduled maintenance, for duplicated SPE systems. (daily, days of the week, or no). "No" prevents scheduled interchanges. (no)

Table 8-1. Scheduled Maintenance Settings — Continued

EXP-LINK Interchange	<p>This field indicates if expansion links between port-networks interchange as part of scheduled maintenance. The value, "daily", means that EXP-LINK interchanges automatically occur everyday. The value "no" means that EXP-LINK interchanges do not automatically occur as part of scheduled maintenance. Values represented by the days of the week mean that EXP-LINK interchanges automatically occur automatically on specified days. Since EXP-LINK interchanges apply to duplicated systems, simplex systems do not display this field. (no)</p>
Minimum Threshold for TTRs	<p>When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV. These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748, TN718, TN420, or TN756; TN2182 and TN744 (suffix C or later) each have 8 TTRs. To alarm the first occurrence of a TTR being taken out of service, set this field to the total number of TTRs in the switch.</p>
Minimum Threshold for CPTRs	<p>When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV. These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748, TN718, TN420, or TN756; TN2182 and TN744 (suffix C or later) each have 8 CPTRs. To alarm the first occurrence of a CPTR being taken out of service, set this field to the total number of CPTRs in the switch.</p>
Minimum Threshold for Call Classifier Ports	<p>When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV. Valid entries are 1 to 200. There are 8 ports on each TN744 or TN2182 circuit pack. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to the total number of CLSFY-PTs. If there are no TN744 or TN2182 circuit packs in the system, leave this field blank.</p>

Continued on next page

Table 8-1. Scheduled Maintenance Settings — Continued

Test Type 100, Test Type 102, Test Type 105	<p>This field specifies extensions assigned to receive tie-trunk calls from other switches that have test line origination capability. The system responds by sending a sequence of test tones. Test Type 100 tests far end to near end loss and C-message by sending:</p> <ul style="list-style-type: none"> ■ 5.5 seconds of 1004 Hz tone at 0dB ■ Quiet until disconnect; disconnect is forced after one minute <p>Test Type 102 tests far end to near end loss by sending:</p> <ul style="list-style-type: none"> ■ 9 seconds of 1004 Hz tone at 0dB ■ 1 second of quiet ■ This cycle is repeated until disconnect; disconnect is forced after 24 hours. <p>Test Type 105 tests 2-way loss, gain slope, and C-message and C-notch noise by sending:</p> <ul style="list-style-type: none"> ■ nine seconds of 1004 Hz at -16dB ■ one second of quiet ■ nine seconds of 404 Hz at -16dB ■ one second of quiet ■ nine seconds of 2804 Hz at -16dB ■ 30 seconds of quiet ■ one-half second of Test Progress Tone (2225 Hz) ■ approximately five seconds of quiet ■ forced disconnect
ISDN-PRI Test Call Extension	<p>This field indicates the extension used by far-end ISDN nodes to place calls to the system, for testing ISDN-PRI trunks between the far-end and the system.</p>

Continued on next page

Table 8-1. Scheduled Maintenance Settings — Continued

ISDN-BRI Service SPID	<p>This field shows if the link associates with the Service SPID. If the link is associated with the Service SPID. This number is the test SPID (0 – 99999) (under BRI-SET MO). Otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.</p>
DSO Loop-Around Test Call Extension	<p>The extension used to set up a DSO loop around connection for testing non-ISDN DS1 trunks. The DSO Loop-Around Test Call feature is used primarily for testing DSO channels associated with non ISDN-PRI trunks. The loop-around is activated by dialing the test extension number; multiple DSO Loop-Around connections can be established by placing multiple calls to the loop-around extension.</p> <p>For more information see “Facility test calls” in Chapter 5, “Routine Maintenance Procedures”.</p>
Loss Plan	<p>Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below. Use this field if additional loss is required to maintain transmission quality for conference calls by entering the digits shown below.</p>

No. Of Parties To Be Conferenced	Enter Digit
3	2
4	3
5	4
6	5
7	6

SPE Optional
Boards:

These fields indicate if a Disk circuit pack is present, and identifies administered Packet Interface slots. If a Packet Interface circuit pack is present, the corresponding Packet Interface field is set to **y** when the system boots. No change to that field is allowed. If the system is equipped with duplicated SPEs, the `Packet Interface` field is set to **y** if either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, the value for the `Packet Interface` field is read from translation data, and stored on disk or tape. If the field is set to **n**, a Packet Interface circuit pack may be administered by changing the corresponding `Packet Interface` field to **y**.

Output (page 2)

The following example shows the output from *page 2* of the **change system-parameters maintenance** command.

```

                                                                    Page 2 of 3

    Bus Bridge: _____ Inter-Board Link Timeslots Pt0: _ Pt1: _ Pt2: _
    
```

Field descriptions

SPE OPTIONAL BOARDS section

- Packet Intf11 Identifies the presence of Packet Interface 1 (always set to **y** for csi and si models).
- Packet Intf12 Identifies the presence of Packet Interface 2 (always set to **y** for the si model). It is changeable for the csi model. If set to **y** for the csi model, the Bus Bridge and Inter-Board Link Timeslots fields display. Default is **n**.
- Bus Bridge The location of the C-LAN circuit pack performing the bus bridge functionality when the packet bus is activated. Enter 5-character circuit pack number (CCcss, where CC = cabinet number 1-3, c = carrier A-E, ss = slot number 0-20). Default is blank.
- Inter-Board Link Timeslot Pt0 The number of timeslots to be used for port 0 on the Inter-Board Link. Displays only if the switch model type is csi and the Packet Intf2 field is **y**. Enter the number of timeslots (**1-9**) to be used by this Inter-Board Link port. Default is **6**.

8 Maintenance Commands and Trouble-Clearing Aids
change system-parameters maintenance

8-38

Inter-Board Link Timeslot Pt1 The number of timeslots to be used for port 10 on the Inter-Board Link. Displays only if switch model type is csi and the Packet Intf2 field is **y**. Enter the number of timeslots (1-3) to be used by this Inter-Board Link port. Default is 1.

Inter-Board Link Timeslot Pt2 The number of timeslots to be used for port 2 on the Inter-Board Link. Displays only if switch model type is csi and the Packet Intf2 field is **y**. Enter the number of timeslots (1-3) to be used by this Inter-Board Link port. Default is 1.

Field descriptions (page 3)

Modem Connection

On page 3 of the example forms, 11 fields disappear when the Modem Connection? field is set to **internal**. In this example the Modem Connection field is set to **external**, revealing the 11 fields.

The first 2 fields on page 3 establish the data format for transmitting serial data from the switch to the modem. The two valid combinations for these 2 fields are:

- Data Bits = 8, Parity = None

8 Maintenance Commands and Trouble-Clearing Aids
change system-parameters maintenance

8-39

- Data Bits = 7, Parity = (odd, even, mark, or space)

Modem Connection	Valid entries are <i>internal</i> (default) or <i>external</i> .
Modem Name	This field is 20 characters long and will permit alpha-numeric characters to provide a unique qualifier for a given modem. ()
RTS/CTS Enabled	This field will inform the modem that communication with the data source UART will be driven with RTS/CTS flow control. This field is 6 characters long and is case in-sensitive. (\Q3)
Asynchronous Data Mode	This field will configure the modem as an asynchronous communications device. This field is 8 characters long and is case in-sensitive. (&M0&Q0)
DTE Auto-Data Speed	This option will adjust the speed of the data source (DTE) UART to the outgoing (modem-to-modem) data rate. So, at maximum this speed would be 9600 baud. This field is 6 characters long and is case in-sensitive. Note that this field sets the link speed between the switch and the modem. It does not set the speed of the modem. It is not desirable to have the serial data fill the modem buffer faster than the outgoing data rate especially because data compression is disabled. ()
Disable Data Compression	This field will turn off the default data compression algorithms that are in use by most consumer modems. This field is 6 characters long and is case in-sensitive. ()
Enable Error Control	This field will turn on the V.42 LAPM and MNP error control protocols, if available on the modem. This field is 6 characters long and is case in-sensitive. This V.42/MNP/Buffer mode first attempts to negotiate V.42 error control with the remote modem. If this fails, then the modem transitions to MNP, and if this fails then no error control is used. ()
Misc. Init. Param	This field supports any initialization parameters that are not already specified. The AT commands specified in this free-form field will be always the last initialization parameters to be sent to the external modem. This field is 20 characters long and is case in-sensitive. ()

8 Maintenance Commands and Trouble-Clearing Aids
change system-parameters maintenance

8-40

Auto-Answer Ring Count This field controls the number of rings required before the modem automatically answers an incoming call, if and only if the switch doesn't answer first. (If the switch is healthy, it answers an incoming within the first few rings.) This field is 6 characters long and is case insensitive. Typically, the maximum permissible value for this register is 255. The values 1-255 denote the number of incoming ring cycles. (S0=10)

 **NOTE:**

The number of rings is optimally set above 5, and if at all possible, keep the default of S0=10.

Dial Type This field controls the type of inter-register signaling to be used between the modem and the Central Office. Use "T" for tone dialing and "P" for pulse dialing. The field length is be 3 characters long and is case in-sensitive. This field will be concatenated with the dial string. (T)

Adjustable Make/Break Ratio This field can be of particular importance when using a modem that may be transferable from country to country. The intent of this field is to control the make/break ratios of pulses and DTMF dialing. The Intel product information has support for the different make/break options for pulse dialing only.

Intel uses the option "&P0" to select a ratio of 39% make and 61% break for communication within the U.S. and Canada. The option "&P1" sets a ration of 33% make and 67% break for the U.K. and Hong Kong.

This field is 5 characters long and is case in-sensitive. ()

Dial Command This field simply denotes the dialing command of the modem. This is a fairly standard command. (D)

No Answer Time-Out Most off-the-shelf external modems provide a timer that abandons any outbound data call after a predetermined interval. Some modems provide for this timer to be disabled, thus allowing an outbound call to ring indefinitely. AT&T Paradyne does not provide this capability with their modem line, because it is generally undesirable to have an outbound call attempt ring indefinitely.

The internal modem must have this parameter disabled or set to at least 255 seconds.

This is a non-administrable parameter. For the external modem connection, this parameter will be the first initialization string to be transmitted to the external modem. This field will be visible on the administration form in display mode only.

This hardcoded constant can be overridden for type approval applications, specifically in the U.K and other Western European nations, by the use of the "Misc. Init. Param:" field. (S7=255)

clear audits

This command clears cumulative and/or peak hour's data collected for each data relation audit since the last **clear audits** command. Using this command before the **status audits** command ensures that the **status audits** report reflects current conditions.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear audits	<i>cumulative</i>	Clears peak hour data collected since the last reboot or clear audits cumulative command	init inads	none	See below
	<i>peak-hour</i>	Clears peak hour data Examples: clear audits cumulative clear audits peak-hour			

Feature Interactions

Status audits displays data cleared by the **clear audits** command. After **clear audits** executes successfully, the **display audits cumulative** and/or **display audits peak-hour** commands display information collected since the last **clear audits** command. The start date displays on the status audits screen reflects the time that **clear audits** executed.

clear errors

This command moves errors and resolved alarms to the cleared-error list, making room for new incoming error messages, but it does not clear active alarms from the alarm log. This command must be used with care to prevent overwriting cleared entries. When additional entries are needed to log new errors, the system overwrites cleared errors first. Use the **display errors** command to list the cleared errors.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear errors		Examples: clear errors	init inads craft	none	none

clear interface

This command reinitializes counter values maintained by the Processor Interface (PI) circuit pack. The **status interface** command displays the counters. The PI circuit pack is a front end processor that implements the packet and link layers of the BX.25 protocol and the ISDN procedure-D protocol.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear interface	<i>location</i>	Processor interface address (cabinet-carrier-position): 1 = first processor 2 = second processor Examples: clear interface 01a1 clear interface 01a2 clear interface a2	init inads craft	none	none

clear isdn-testcall

This command cancels any ISDN-PRI test calls in progress. Once a running test call is cleared, another can begin.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear isdn-testcall	<i>group number</i> <i>member number</i>	Trunk group number Member within a trunk group Examples: clear isdn-testcall 80/1 clear isdn-testcall 78/2	init inads craft	none	none

clear link

This command clears the counters associated with a numbered PPP C-LAN link. The **clear clan-port** command accomplishes the same thing. The statistical counters cannot be cleared for an Ethernet C-LAN link.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear link	<i>link-id</i>	Link number (1-8) assigned through communication-interface links form. Examples: clear link 1 clear link 8	init inads craft	none	none

clear mst

This command clears the trace buffer and is generally used before enabling a trace. If this command is executed while a trace is enabled, it clears unwanted data.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear mst		Examples: clear mst	init inads	none	none

clear pkt

This command helps resolve packet bus problems by sending a 'clear stimuli' message over the packet bus.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear pkt	port network location	Physical location of the packet bus (1 - 3) Examples: clear pkt port-network 1	init inads craft	none	none

clear port

This command removes maintenance marks from a port, freeing it for use.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
clear port	location	Port location (PCsspp) Examples: clear port 01c1102	init inads cust nms	none	none

copy update-file

In Duplex systems only, this command copies update files from the active SPE to the standby SPE. This command recovers field update ("patch") files that are downloaded to the switch when the Standby SPE is unavailable. The switch makes validation checks on the standby as it receives the file. If a newer, valid update file exists on the standby, use the override option to force the copy.

8 Maintenance Commands and Trouble-Clearing Aids
disable administered-connection

8-44

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
copy update-file	<i>override</i>	Copies update files from active to standby SPE, regardless of the dates. Examples: copy update-file copy update-file override	init inads	none	See below

Feature Interactions

- The form display for the **list configuration software-vintage** command allows INADS to determine the hardware configuration, software vintage, and patch identifier.
- Because patches are applied on restarts before the system is in normal operation, no interaction with routine periodic or scheduled maintenance exists.
- The flash checksum test acts as a backup check to ensure entire field update files are applied correctly. When the flash Checksum Test fails, a MAJOR on-board alarm is raised on the processor/memory circuit pack. Maintenance runs a data consistency test on a daily basis to check that copies of translations, announcements, and software files are consistent across both processors in a High or Critical Reliability System. If the test detects a difference, a minor, off-board alarm is generated.
- When checking software, the test compares the memory resident software version and the patch identifier. It also searches for the presence of field update files. If found, it compares the old and new patch identifiers to ensure that the same patch file id is loaded on each processor. If the software or update files are inconsistent, the **list configuration software** command displays the patch file status.

disable administered-connection

This command stops both scheduled and periodic testing and stops processing of in-line errors for all or selected administered connections.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
disable administered-connection	<i>ac number</i> <i>all</i>	Number of the administered connection Selects all administered connections Examples: disable administered-connection all disable administered-connection 1 disable administered-connection 128	init inads craft cust rcust mis	none	none

disable mst

This command stops the message trace facility. If the trace was not already disabled, the command inserts a GAP marker into the trace. The user should execute the **disable mst** command when the trace is complete. If left enabled, the trace continues to use CPU time until the time limit expires. Entering **disable mst** command has no effect on the system if the trace is already disabled. To view the results of the trace, enter the **list mst** command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
disable mst		Example: disable mat	init inads	none	none

disable suspend-alm-orig

This command stops entries from the active Suspend Alarm Origination table and disables all board entries that match a specific physical board location.

NOTE:

This command does *not* disable port entries.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
disable suspend-alm-orig	board location	Physical location of the replaced or corrected board (does not support port location): PCs Examples: disable suspend-alm-orig 1C03 disable suspend-alm-orig 1E07	init inads craft cust rcust	none	none

disable synchronization-switch

This command stops the automatic clock switching capability of the maintenance subsystem. The clock refers to the oscillator on a tone/ clock or DS1 interface. The synchronization subsystem (TDM bus clock, DS1 trunk board, and maintenance and administration software) provides error-free digital communication between the switch and other PBXs, COs, or customer equipment.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
disable synchronization-switch			init inads craft	none	none

disable test-number

This command prohibits selected maintenance tests from running. To run a disabled test number, enter the **enable test-number** command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
disable test-number	<i>number</i>	Maintenance test number	init	none	none
	<i>print</i>	Report sent to printer	inads		
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: disable test-number 710 disable test-number 710 print disable test-number 510 schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

display alarms

This command creates an Alarm Report. The user completes an option screen to select the parameters for the report.

The system creates the reports from the logs of the maintenance subsystem. The subsystem monitors the system hardware and logs problems as errors or alarms. The type of alarm indicates the impact of the problem, as defined below:

Warning alarm—A minor interference which does not noticeably impair service.

Minor alarm—A problem which could disable a local area of the system and noticeably impair service.

Major alarm—A problem which widely degrades the system and seriously impairs service. The system automatically calls INADS to report major alarms.

Resolved alarm—A problem which has been corrected, and the system is correctly functioning. The system stamps resolved alarms with the date and time the problem was corrected. The system handles any errors associated with the alarms as “resolved.”

System Reboots and the Alarm Logs

The system saves the alarm and error logs to the *active* SPE memory card if any of the following events occur:

- The **save translation** command is executed
- Translations are saved as part of scheduled maintenance
- A reboot
- The PPN is about to lose all power after having been on battery backup

The attempt to save the alarm and error logs may be unsuccessful if the MSS is not available.

Whenever the system reboots, the logs are restored from the SPE disk that becomes active with the reboot. Since the logs are saved to the disk on the SPE that was active *before* the reboot, the versions restored at reboot time may not be current. This condition occurs if:

- The attempt to save at reboot did not succeed.
- The SPE disk that is rebooted is not the same disk to which the logs were last saved.

In such a case, the logs do not contain the most recent errors and alarms. To determine if the restored logs are complete, look for indications that would have preceded the reboot.

System resets, that are less severe than a reboot, rarely affect the error and alarm logs.

NOTE:

If the error and alarm logs contain SYSTEM errors, then use the **display initcauses** command to search for information that the system could *not* log during reset operation.

8 Maintenance Commands and Trouble-Clearing Aids
display alarms

8-48

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display alarms	<i>print</i>	Report sent to printer	init inads craft cust rcust bcms browse	all alarms displayed	See below
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display alarms display alarms print display alarms schedule			

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

- If the user disables the alarm origination with the **change system parameters-maintenance** command, then the Ack? (Acknowledged) field on the Alarm Report is blank regardless of the true acknowledged state of the alarm.

Options screen

When you enter the **display alarms** command, the system first displays the options screen. Select the options you want to view on the report. The figure below is an example of the options screen for Alarm Reports.

```

display alarms                                     Page 1 of 1
                                     ALARM REPORTS

The following options control which alarms will be displayed.
ALARM TYPES
    Active? y_           Resolved? n_
    Major? y_           Minor? y_           Warning? y_
REPORT PERIOD
    Interval: m_       From: __/__/__:__ To: __/__/__:__
EQUIPMENT TYPE ( Choose only one, if any, of the following )
    Cabinet: _____
    Port Network: _____
    Board Number: _____
    Port: _____
    Category: _____
    Extension: _____
    Trunk ( group/member ): __/___
    
```

The fields on the options screen are described below:

ALARM TYPES	Enter y (yes) or n (no) in any of the 5 alarm type fields
Interval	Enter one of the codes below: m = last month h = last hour d = last day w = last week a = all (default)
From	Month/day/year (example: 01/01/97); if the <code>From</code> date is blank, the report contains all the active alarms for the month <i>prior</i> to the current date.
To	Month/day/year (example: 01/15/97); if the <code>To</code> date is not entered, the report contains all the active alarms starting with the <code>From</code> date to the current date.
Cabinet	Administered cabinet number (1-3)
Port Network	1-3
Board Number:	Board address (PCSS); example: 01A20
Port	Port address (PCSSpp); example: 01A2031
Category	Object code for the equipment category. Press <code>HELP</code> in this field to view a list of the object codes.
Extension	Extension number (per dial-plan)
Trunk	Enter a group number or a group and member number: <ul style="list-style-type: none">■ Enter <i>only</i> the group number (01-99) to display <i>all</i> members in the group. Example: 01/___■ Enter <i>both</i> the group number (01-99) and member number (01-99) to display a <i>specific</i> member in a group. Example: 01/99

Output

After you complete the options screen, the system displays a 1- or 2-page Alarm Report. To toggle between the pages and to exit the report, use the keys described below:

- For 513 and 715 terminals, use **F8** for `NEXT PAGE` and `PREV PAGE` commands
- For all other terminals, use **F7** for `NEXT PAGE` and `PREV PAGE` commands
- Use **Esc** for the `CANCEL` command

The figure below is an example of an Alarm Report.

```
display alarms
```

ALARM REPORT

Port	Maintenance Name	On Brd?	Alt Name	Alarm Type	Svc State	Ack? 1 2	Date Alarmed	Date Resolved
02A	TONE-BD	y		MAJOR		y n	05/22/20:34	00/00/00:00
01C07	ANL-BD	y		MINOR		n n	05/22/20:26	00/00/00:00
01C0702	ANL-LINE	n	311	WARNING	IN		05/22/20:26	00/00/00:00

01C1505	CO-TRK	n	78/01	WARNING	OUT		05/22/20:26	00/00/00:00
02A0201	TONE-PT	n		WARNING			05/22/20:34	00/00/00:00
02A	TDM-CLK	n		WARNING			05/23/13:43	00/00/00:00
PN 02B	TDM-BUS	n		WARNING			05/23/14:53	00/00/00:00

Command successfully completed

Field descriptions

- Port** Lists the location codes for the alarmed object, as follows:
- Circuit packs locations display as: cabinet-carrier-[slot]-[circuit]. Example: **01C0702**.
 - Port network locations display as: port network number-bus. Example: **PN 02B**. PN 02 = Port Network (PN) number and A or B = bus.
 - Fiber link locations display as: fiber link number-PNC side. Example: **x A-PNC**. "X" = fiber link number and "A" = PNC side [A or B].
- Maintenance Name** Lists the logical name of the maintenance object with the alarm.
- On Brd** A **y** (yes) indicates the fault was found on the associated circuit pack. An **n** (no) indicates the fault is **not** connected to the circuit pack.

Alt Name	Identifies the location of maintenance object, as follows: <ul style="list-style-type: none">■ Station = extension number■ Trunk = Group number (78/__) or group and member numbers (78/01)■ Private CO Line = private CO line (P) and group number. (P/xxx)
Alarm Type	Alarm level: MAJOR, MINOR, or WARNING
Service State	Identifies the service state of the station and trunk ports, as follows: <ul style="list-style-type: none">■ RDY = ready for service■ OUT = out of service■ IN = in service■ [Blank] = No associated service state
Ack?	Headings 1 and 2 identify the first and second OSS telephone numbers, respectively. The entries below indicate the acknowledged alarm state: <ul style="list-style-type: none">■ Y (yes) = alarm has been acknowledged■ N (no) = alarm has not been acknowledged■ C (cleared) = alarm was first acknowledged, then resolved and cleared [Blank] = no attempt was made to report the alarm  NOTE: If the user disables the alarm origination with the change system-parameters maintenance command, then the Ack? field is blank regardless of the true acknowledged state of the alarm.
Date Alarmed	Indicates the month, day, hour, and minute of the alarm.
Date Resolved	Indicates the month, day, hour, and minute of the resolution. For active alarms, this field contains zeros (0).

display cabinet

This command displays the cabinet description and location and the carrier description for a selected cabinet number.

8 Maintenance Commands and Trouble-Clearing Aids
display cabinet

8-52

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display cabinet	<i>print</i>	Report sent to printer	init inads craft cust rcust	none	none
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display cabinet 1			

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The example below shows the output for the **display cabinet 1**.

```
display cabinet 1
                CABINET

CABINET Description
    Cabinet: 1
    Cabinet Layout: five-carrier
    Cabinet Type: processor
    Number of Portnetworks: 1
        Room: 30n46
        Floor: first
        Building: main

CARRIER Description
    Carrier      Carrier Type      Number
    C            port                PN    01
    B            not-used           PN    01
    A            processor         PN    01
    X            Fan                PN    01
    D            not-used           PN    01
    E            switch-node        SN    01

Command Successfully Completed
```

Field descriptions

Cabinet	Administered cabinet number
Cabinet Layout	Type of cabinet (five-carrier or single-carrier-stack)
Cabinet Type	Type of port network (processor or expansion)
Number of Port networks	Number of port networks (1 or 2)
Room	Room where cabinet is located, if administered on the cabinet form.
Floor	Floor where cabinet is located, if administered on the cabinet form.
Building	Building where cabinet is located, if administered on the cabinet form.
Carrier	Letter identifying the carrier (A-E or X not applicable)
Carrier Type	Port, processor, switch-node, fan, or not-used
Number	Administered port network number <i>or</i> switch node number

When you enter the command: **display cabinet 3** and the cabinet is a stack of single-carrier-cabinets, the system displays a screen similar to the figure below. The fields on the screen are the same as described above.

```

display cabinet 3

                                CABINET

CABINET Description

Field descriptions (page 3)

Call Coverage

Coverage Answer Groups	The number of Coverage Answer Groups. For further information, see <i>DEFINITY Enterprise Communications Server Administration and Feature Description</i> .
Coverage Paths	Coverage Paths — The number of coverage paths which is a path taken when a call goes to coverage. For further information, see <i>DEFINITY Enterprise Communications Server Administration and Feature Description</i> .
Call Pickup Groups	The number of call pickup groups have been administered. For further information, see <i>DEFINITY Enterprise Communications Server Administration and Feature Description</i> .
Call Records	The maximum number of active calls at a given time. This field does not display real-time data, just the system limit and is not administerable.

Call Vectoring/Call Prompting

Vector Directory Numbers	The number of system VDNs. For further information, see <i>DEFINITY Call Vectoring/Expert Agent Selection</i> .
Vectors Per System	The number of vectors per system. For further information, see <i>DEFINITY Call Vectoring/Expert Agent Selection</i> .
BSR Application - Location Pairs Per System	The number of mappings administered in a multisite network. The maximum number of application-location pairs per system is 1000. For example, for a network of 10 locations, you can assign 100 applications; with 50 locations, you can assign 20 applications. For further information, see <i>DEFINITY Call Vectoring/Expert Agent Selection</i> .

Field descriptions (page 4)

Data Parameters

Administered Connections The number of connections between two access or data endpoints. For further information, see *DEFINITY Enterprise Communications Server Administration and Feature Description*.

Alphanumeric Dialing Entries For further information, see *DEFINITY Enterprise Communications Server Administration and Feature Description*.

Dial Plan

Extensions This includes stations, data endpoints, hunt groups, announcements, TEGs, VDNs, common shared extensions, and code calling IDs.

Miscellaneous Extensions Anything that is not a station, trunk, data module, or attendant. This includes, but is not limited to, PCOL groups, common shared extensions, access endpoints, administered TSCs, code calling IDs, VDNs, LDNs, hunt groups, announcements, and TEGs.

UDP Extension Records The number of 4- or 5-digit extension numbers that allow a user to call from one PBX to another using that number.

- Digital Data Endpoints The number of digital serial communication devices that permit the asynchronous transfer of data. This also includes the number of analog adjuncts.
- Expansion Port Networks The number of port networks connected to the TDM bus and packet bus of a process port network.
- Facility Busy Indicators The number of visual indicators of the busy/idle status of any particular trunk group, hunt group member, or station user. For further information, see *DEFINITY Enterprise Communications Server Administration and Feature Description*.

Field descriptions (page 5)

Hunt Groups, Splits, or Skills

- Groups/Splits/Skills The number of ACD hunt groups.
- Logged-In ACD Agents A *real-time* field displaying the number of agents actually logged in. For example, if an agent is logged into 4 skills (and there are no other agents), then the Logged-In ACD Agents field is 1 and the Group Members Per System field is 4.
- Group Members Per System The number of agent/group pairs.
- CMS Measured ACD Members The number of agent pairs being measured by CMS.

8 Maintenance Commands and Trouble-Clearing Aids
display capacity

8-60

- Queue Slots Per System The number of hunt group queue positions.
- Queue Status Buttons The number of hunt group queue status buttons administered on stations. There are four types of queue status buttons; attendants use the last two queue status buttons:
- q-calls (Queue Calls)
 - q-time (Queue Time)
 - atd-qcalls (ATD - Queue Calls)
 - atd-qtime (ATD - Queue Time)
- Intercom Groups Per System The number of intercom groups set up within your organization.
- Modem Pool Groups Per System The number of modem pool groups. For further information, see *DEFINITY Enterprise Communications Server Administration and Feature Description*.
- Personal CO Line (PCOL) Trunk Groups The number of PCOL trunk groups. For further information, see *DEFINITY Enterprise Communications Server Administration and Feature Description*.

Figure 8-4. System Capacity form (page 6 of 9)

Field descriptions (page 6)

Recorded Announcement Analog Queue Slots
 The number of calls in queue for the system's analog announcements.

Temporary Signaling Connections (TSC)

Administered TSCs
 The number of allowed Temporary Signaling Connections (TSCs).
 NCA-TSC Calls
 The number of allowed Non-Call Associated TSCs.

Trunks

DS1 Circuit Packs
 The number of allowed DS1 circuit packs.
 ICHT For ISDN Trunks
 The number of Incoming Call Handling Table (ICHT) entries administered for trunk groups.
 ISDN CBC Service Selection Trunks
 The number of call-by-call trunk groups.
 Trunk Groups
 The number of trunk groups administered.
 Trunk Ports
 The number of trunk ports administered.

Voice Terminals

Station Button Memory (units)	The percentage of memory being consumed by all administered buttons.
Station Records	The number of resources being used by regular stations, announcements, and music on hold.
Stations	The number of voice terminals.
Stations With Port	The number of connected voice terminals (stations with specific administered ports).
Stations Without Port	The number of voice terminals not having an administered port, such as AWOH.
Other Stations	The number of ports used as conversion resources, agent login ID, MASI, and analog announcements.
TTI Ports	The number of ports assigned by TTI features.

Total Subscribed Ports

ISDN BRI Ports	The number of ISDN-BRI ports.
Station and Trunk Ports	The number of stations with ports and assigned trunk ports.

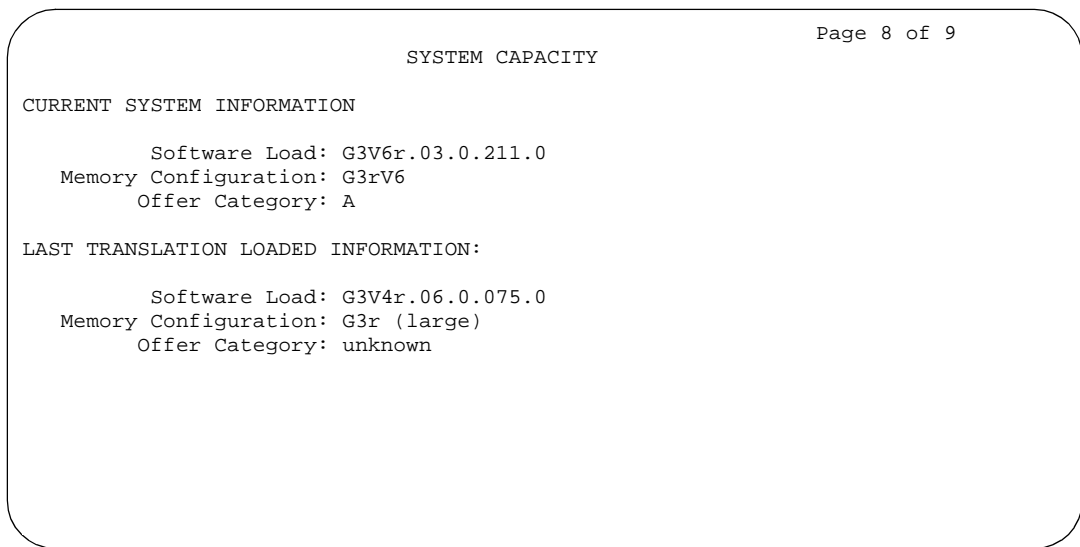

Figure 8-6. System Capacity form (page 8 of 9)

Field descriptions (page 8)

Current System Information

- Software Load The current software load on which the system is running.
- Memory The system platform.
- Configuration
- Offer Category The system's offer category.

Last Translation Loaded Information

- Software Load The software load translations saved before upgrade or reboot. Can also be `unknown/no trans` if no flash card is present. Also, if load translations were upgraded from one prior to G3V4 load 71 or early G3V5 loads, `unknown/no trans` displays.
- Memory The platform on which the translations were saved. Can also be `unknown` if no flash card is present or translations made on old load. This is important because platforms are not always compatible.
- Configuration
- Offer Category The offer category that was set when the last save translation was done before upgrade or reboot. Can also be `unknown` if no flash card is present or translations made on old load.

display communication-interface

The **display communication-interface** command must contain one of the three qualifiers:

- hop-channels: see [“display communication-interface hop-channels”](#)
- links: see [“display communication-interface links”](#)
- processor-interface: see

display communication-interface hop-channels

The **display communication-interface hop-channels** command displays the translation data for hop channels. A hop channel is a bi-directional network channel between two interface links for DCS message hopping. A hop channel is used to tandem DCS messages from one interface link to another interface link.

See also [“status link n”](#) for more details.

8 Maintenance Commands and Trouble-Clearing Aids
display communication-interface hop-channels

8-65

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display communication-interface	hop-channels	See above	init	none	none
	links	See above	inads craft cust rcust		
	processor-channel	See above			
	print 	Report sent to printer			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output for Hop-channels qualifier

When you enter the command **display comm hop**, the systems displays the Hop Channel Assignment screen, similar to the figure below. The number of the local processor channel, used to hop the interface link channels, is not shown.

```

display communication-interface hop-channels           Page 1 of 4
                                     HOP CHANNEL ASSIGNMENT
Link/Channel A   Link/Channel B       Link/Channel A   Link/Channel B
3      1         4      12
    
```

Field descriptions

Link/Channel A

Identifies the first of the two link/channels joined by the hop channel. Links range from 1 to 16. Channels range from 1 to 64. The link/channel must not be assigned to a local processor channel. Also, the link must not be assigned to a PRI local processor channel.

Link/Channel B Identifies the second of the two link/channels joined by the hop channel. Links range from 1 to 16. Channels range from 1 to 64. The link/channel pair must not be assigned to a local processor channel. Also, the link must not be assigned to a PRI local processor channel.

display communication-interface links

This command displays the translation information for each communication interface link. A link is an electronic communication channel transmitted over the Packet Bus for carrying packet-switched data. There are 16 links that terminate at one end on the Packet Interface circuit pack in the SPE. At the physical and link layers, the link terminates at the other end on a port on the PBX's switching matrix. At a higher level, the link continues over a transmission facility to another endpoint, such as a DCS node or AUDIX. The link carries application messages between the SPE and other switches or adjuncts.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list communication-interface	<i>links</i>	Example: list communication-interface links	init inads craft	none	None

Output

The following example shows the output from the **display communication-interface links** command.

```

display communication-interface links                                     Page 1 of 2

Field descriptions

Link	Number of the administered link (data module form).
Enable	Yes (y) or no (n) depending upon data module administration (Processor Interface, X.25, Ethernet, and PPP).
Est. Conn.	Establish Connection data from the data module forms (Processor Interface, X.25, and PPP).
Ext	Extension number of the local data module for this link.
Type	Protocol for this link: <ul style="list-style-type: none"> ■ bx.25 (Processor Interface and X.25) ■ ppp ■ ethernet
Destination Number	Destination of the link as administered on the data module forms (Processor Interface, X.25 and PPP).
DTE/DCE	Processor Interface administration from data module form (Processor Interface only).
Conn. Mod.	Connected Data Module administration from data module form (Processor Interface and X.25 only)
Name	Administered name from the data module forms (Processor Interface, X.25, Ethernet, and PPP)

display communication-interface processor-channel

This command displays the translation information for each of the local processor channels. A processor channel is one several data streams which are multiplexed by the X.25 protocol onto a single data link. The system has 128 total processor channels; up to 64 can be assigned to a single link.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display communication-interface processor-channel	<i>number</i>	Example: display communication-interface processor channel 125	init inads craft	none	none

Output

The following example shows the output from the **display communication-interface processor-channel** command.

Field descriptions

- Proc Chan** Displays the BX.25 virtual channel number or the TCP/IP listen port channel to carry this processor (virtual) channel.
- Enable** Type **y** to enable a processor channel. Type **n** (default) to disable a processor channel.
- Appl.** Identifies the switch application used over this link. The application gateway is used for conversion between ISDN and either TCP/IP or BX.25. Use the **gtwy-tcp** entry for conversion between BX.25 and TCP/IP. Valid entries are: audix, dcs, fp-mwi, gateway, gtwy-tcp, mis, msaamwl, msackl, msahlwc, msallwc, msamcs, qs-mwi, blank (default)
- Gtwy To** Identifies which processor channel the given processor channel is serving as a gateway to. Valid entries are a number between 1-(maximum number of processor channels), or blank (default).
- Mode** Identifies whether the IP session is passive (client) or active (server). This field must be blank if the type of interface link is **x.25** (r model) or **procr-intf** (si model). This field cannot be blank if the type of interface link is **ehternet** or **ppp**. Valid entries are **client**, **server**, or blank (default).
- Interface Link** Identifies the physical link carrying this processor (virtual) channel. Links numbered 1 through (4 times the number of PI circuit packs) for the si model can be either **x.25** or **tcp/ip**. The rest of the links (up to 25) must be **tcp/ip**.

8 Maintenance Commands and Trouble-Clearing Aids
display disabled-tests

8-69

Interface Chan	Identifies the BX.25 virtual channel number or the TCP/IP listen port channel to carry this processor (virtual) channel. The channel number 0 means any port can be used. Valid entries for link type x.25 are 1-64 ; for Ethernet or ppp, 0, 5000-64500 .
Destination Node	Identifies the switch or adjunct at the far end of this link. Enter an adjunct name, switch name, far end IP address, node ID, or leave blank (default) for services local to this switch.
Destination Port	Identifies the port number of the destination. The number 0 means any port can be used. Valid entries are 0 (default), 5000-64500 .
Session Local	Field ported forward from R6.
Session Remote	Field ported forward from R6.
Mach ID	Field ported forward from R6.

display disabled-tests

The **display disabled-tests** command lists the numbers for all maintenance tests that have been disabled by INADS. These tests are not available for background or demand testing.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display disabled-tests	<i>print</i>	Report sent to printer	init inads craft cust rcust	none	none
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output from the **display disabled-tests** command.

```
display disabled-tests                               SPE A

                                     DISABLED TEST INFORMATION

Test Number

710

Command successfully completed
```

display errors

This command creates an Alarm Report from a user-option screen to select the report parameters. The system creates the reports from the logs of the maintenance subsystem, which monitors the system hardware and logs problems as errors or alarms.

Errors can result from in-line firmware errors, periodic tests, failures detected while executing a test command, software inconsistency, or a data audit discrepancy.

System Reboots and the Error Logs

The system saves the alarm and error logs to the *active* SPE memory card if any of the following events occur:

- The **save translation** command is executed.
- Translations are saved as part of scheduled maintenance.
- A reboot
- The PPN is about to lose all power after having been on battery backup.

The attempt to save the alarm and error logs may be unsuccessful if the MSS is not available.

Whenever the system reboots, the logs are restored from the SPE disk that becomes active with the reboot. Since the logs are saved to the disk on the SPE that was active *before* the reboot, the versions restored at reboot time may not be current. This condition occurs if:

- The attempt to save at reboot did not succeed.
- The SPE disk that is rebooted is not the same disk to which the logs were last saved.

In such a case, the logs do not contain the most recent errors and alarms. To determine if the restored logs are complete, look for indications that would have preceded the reboot.

System resets, less severe than a reboot, rarely affect the error and alarm logs.

NOTE:

If the error and alarm logs contain SYSTEM errors, then use the **display initcauses** command to search for information that system could *not* log during reset operation.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display errors	high resolution	Highlights the time stamps on the Error Report for the first and last occurrences of the error.	init inads craft cust nms browse	all errors displayed	none
	print	Report sent to printer			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display errors display errors print display errors schedule display errors high-resolution print			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Input form

When you enter the **display errors** command, the system first displays the options screen. Select the options you want to view on the report. The figure below is an example of the options screen for an Error Report.

```

display errors                                     Page 1 of 1
                                ERROR REPORT
The following options control which errors will be displayed.
ERROR TYPES
  Error Type: _____ Error List: active-alarms
REPORT PERIOD
  Interval: _           From: __/__/__:__ To: __/__/__:__
EQUIPMENT TYPE ( Choose only one, if any, of the following )
  Cabinet: _____
  Port Network: _____
  Board Number: _____
  Port: _____
  Category: _____
  Extension: _____
  Trunk ( group/member ): __/___
    
```

Field descriptions

- Error Type** Enter a specific error type; press HELP in this field to view a list of codes. If the field is blank, the system displays all errors.
- Error List** Enter one:
- active-alarms (default)
 - errors
 - cleared-errors
- The title for the Hardware Error Report includes the name of the selected error list.
- Interval** Enter one:
- m = last month
 - h = last hour
 - d = last day (default)
 - w = last week
 - a = all
- From** Enter 2-digit numbers for the month/day/year (Example: 01/01/97). The default is the earliest time of the existing error records in the log.
- To** Enter 2-digit numbers for the month/day/year (Example: 01/01/97). The default is the current date.
- Cabinet** Enter 1, 2, or 3 (the administered number)
- Port Network** Enter 1, 2 or 3
- Board Number:** Enter the **PCSS** location. Example: 01A20
- Port** Enter the **PCSSpp** location. Example: 01A2031
- Category** Enter the object code for the equipment category. Press HELP in this field to view a list of the object codes

- Extension Enter the extension number.
- Trunk Enter a group number or a group and member number:
- Enter *only* the **group** number (01-99) to display *all* members in the group. Example: 01/___
 - Enter *both* the **group** number (01-99) and **member** number (01-99) to display a *specific* member in a group. Example: 01/99.

Form output

After completing the options screen, the system displays a 1- or 2-page Hardware Error Report. To toggle between the pages and to exit the report, use the keys described below:

- For 513 and 715 terminals, use **F8** for NEXT PAGE and PREV PAGE commands
- For all other terminals, use **F7** for NEXT PAGE and PREV PAGE commands
- Use **Esc** for the CANCEL command to exit the report.

The figure below is an example of an Hardware Error Report -- Active Alarms, **without** the high-resolution qualifier in the command line.

```
display errors                                     Page 1   SPE A
                                     HARDWARE ERROR REPORT - ACTIVE ALARMS
```

Field descriptions

Port	<p>Lists the location codes for the alarmed object, as follows:</p> <ul style="list-style-type: none">■ Circuit packs locations display as: cabinet-carrier-[slot]-[circuit]. Example: 01C702.■ Port network locations display as: port network number-bus. Example: PN 02B. PN 02 = Port Network (PN) number and A or B = bus.
Maintenance Name	<p>The of the maintenance object.</p>
Alt Name	<p>Identifies the location of maintenance object, as follows:</p> <ul style="list-style-type: none">■ Station = extension number■ Trunk = Group number (78/__) or group and member numbers (78/01)■ Private CO Line = private CO line (P) and group number (P/xxx)
Error Type	<p>Error number for the type of problem encountered. The technician must use this error number in conjunction with the logical name information to determine the exact nature of the error.</p>
Aux Data	<p>Additional information concerning the error condition. Like the error type, this data is specific to the maintenance object type. However, unlike the error code, only the most recent value of the auxiliary data is retained for each error record.</p>
First Occur	<p>Displays the month, day, hour, and minute (and second if the high-resolution command line option is used) that the error was first recorded.</p>
Seq Cnt	<p>Sequence Count - This number indicates the order of errors logged within a second for the time stamps associated with the first occurrence and last occurrence of an error. This information is displayed only if the high-resolution command line option is entered. There may be gaps for the sequence numbers within a given second, since the last occurrence of an error may replace an existing entry that had been assigned the missing sequence number. Gaps may also appear in the numbers since sequence counts are also used with software event information not shown in the hardware error log.</p>
Last Occur	<p>Displays the month, day, hour, and minute (and second if the high-resolution command line option is used) of the most recent error. Note: if the system is unable to retrieve the time of day when the error occurred, a 'dummy' date is stamped in the log and appears as: 00/00/01:07.</p>

8 Maintenance Commands and Trouble-Clearing Aids
display errors

8-75

Err Cnt	Error Count - The total number of times that the error type has occurred for this maintenance object. If the number of errors exceeds 3 digits, the system enters the number 256 , which indicates that a larger number of errors occurred, but could not be displayed correctly.
Err Rt	Error Rate - The average rate at which the errors have occurred from the first occurrence to the present. If the number of errors exceeds 3 digits, the system enters the number 256 , which indicates that a larger number of errors occurred, but could not be displayed correctly.
Rt/Hr	Rate per Hour - An approximation of the rate that this error occurred in the last hour. If the number of errors exceeds 3 digits, the system enters the number 256 , which indicates that a larger number of errors occurred, but could not be displayed correctly.
Al St	Alarm Status - A character indicating the status of this MO in the error and alarm logs. The allowed values are: a = Active r = Resolved c = Resolved as a result of the long "clear" option s = Resolved; software-requested system restart t = Resolved; technician-requested system restart n = Not alarmed
Ac	Active? - A y (yes) entry indicates the maintenance object is still active. A n (no) entry indicates the object is no longer a problem.

The figure below is an example of an Hardware Error Report -- Active Alarms, using the high-resolution qualifier.

When you enter the command **display errors high-resolution**, the system adds the Seq Cnt (sequence count) column. The number in the column indicates the order of errors logged within a second for the time stamps associated with the first occurrence and the last occurrence of an error. Refer to the field description above for more details.

Command successfully completed

display events

A vector event is the occurrence of something unexpected during a vector-routed call due to resource exhaustion or faulty vector programming. For example, route-step failures are typically due to the programming of an invalid extension. These types of failures are not due to faulty hardware or system software error and do not constitute incorrect feature operation. This command allows you to diagnose and correct vectoring problems due to the above-mentioned causes. See *DEFINITY Communications System Generic 3 Call Vectoring and Expert Agent Selection (EAS) Guide, 555-230-520*, for information on how to interpret this report.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions

Field descriptions

Category	Vector specifies the type of event report and is the only valid entry.
Report Period	View only those vector events that occurred within a specific time period. If left blank, all recorded vector events are displayed.
Interval:	Displays all events within the last time period. Enter the first letter of one of the following selections: <i>all, month, day, hour, minute</i> .
Start/Stop Time	Start and end times of the interval to be reported in 24-hour notation.
Vector Number	Vector number (1-256) for which events is reported; if left blank, events for all vectors are reported.
Event Type	Specific types of vector events are associated with numbers from 50000 to 50999. Entering one of these numbers limits the report to events of this type. If left blank, events for all types of vectors are reported.

Output

See *DEFINITY Communications System Generic 3 Call Vectoring and Expert Agent Selection (EAS) Guide*, 555-230-520, for more information on how to interpret this report. In particular, the Event Data 2 field are associated with possible causes and repair strategies for the event.

Event Type	Type of vector event (50000 to 50999)
Event Description	A text string describing the event.
Event Data 1	Vector/step numbers are displayed as 200/10; split numbers display as Split 2.
Event Data 2	Additional data (hex number) concerning the event.
First Occur	The date and time when the vector event first occurred.
Last Occur	The date and time when the vector event last occurred.
Evnt Cnt	Total number of times that vector events of this type have occurred (max. 255).

The following example shows a typical vector event report.

```

display events                                     Page 1   SPE B

                                EVENTS REPORT

```

display initcauses

The **display initcauses** command displays a history of recovery steps taken by the system. *This command displays information for restarts of the active processor only.* Each time the system performs some type of recovery (user request or a hardware or software problem), the recovery information is stored. The software error log also contains information pertaining to restarts. If a reset 4 (reboot) occurs, the software error log are also stored on tape. Information in the software error log should be used in conjunction with information in the initcauses log.

The history of the last 16 restarts performed by the system is recorded to the initcauses buffer in chronological order. This buffer fills an entire screen with

8 Maintenance Commands and Trouble-Clearing Aids
display initcauses

8-79

information if it is completely full. Power failures in the processor complex wipe out the entire *initcauses* buffer. In duplex systems, both processors have to lose power before the information is lost.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display initcauses	print	Report sent to printer	init inads craft nms	none	none
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display initcauses display initcauses print display initcauses schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output from the **display initcauses** command.

```
display initcauses
```

INITIALIZATION CAUSES

Cause	Action	Escalated	Carrier	Time

Command successfully completed

Field descriptions

Cause

Reason for the restart:

- **Active Down:** (High or Critical Reliability system only) The Active SPE went into SPE Down mode. The Duplication Interface initiated an SPE-interchange to the Standby SPE. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability system does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Bad Handshake:** (High or Critical Reliability system only) The Duplication Interface received inconsistent handshakes from the Active SPE. Thus, the Duplication Interface initiated an SPE-interchange to the Standby SPE. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a COLD 2 restart to recover properly only minutes after the warm start has occurred.
- **Bad Memory:** A defective memory circuit pack generating too many errors caused a restart.
- **System Technician Request:** The restart was performed because of system technician demand. A system technician-requested **reset system 4** command entry should always precede an **upgrade software** command entry.
- **Failed Interchange:** A “hot-start” interchange (system technician-demanded, scheduled, or software-requested) failed because shadowing was disabled.
- **Initialized:** This is always the first entry in the history and is present until more than 15 restarts have been performed. It indicates power-up and also occurs if the Maintenance/Tape Processor is reset during initialization.

- **LMM Request:** A sanity time-out was requested by the LMM firmware. The three processor circuit pack LEDs blink until the sanity timer goes off. The LMM requests a restart like this when it gets into trouble, usually with memory.
- **Maintenance Reset:** The Maintenance/Test Processor or Duplication Interface reset the system. This refers to resets of the SPE by maintenance in SPE Down mode in which maintenance periodically tries to awaken the SPE.
- **No Handshake:** (High or Critical Reliability System only) The Duplication Interface lost handshaking with the active SPE and has requested a SPE-interchange to the Standby SPE. [A defective tape drive may cause the Active SPE to miss handshakes with the Duplication Interface which, in turn, could result in an initialization cause of "No Handshake." Check the Hardware Error Log for TAPE-related error types and alarms and follow the recommended repair procedures in the TAPE Maintenance documentation.] If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Oryx Request:** A sanity time-out was requested by the Oryx operating system. The three processor circuit pack LEDs blink until the sanity timer goes off. Oryx requests a restart like this when it gets into trouble, usually with software.
- **Sanity Timer Reset:** The sanity timer on the processor timed out and reset the system. This event usually indicates a software fault.
- **Scheduled Interchange:** A scheduled SPE-interchange occurred.
- **Software Request:** Software requested the system restart. In a system equipped with High or Critical Reliability, software can also request SPE-interchanges when it detects problems. See the Software Requested Interchanges Caused by Alarm Conditions table ([Table 6-2](#)) in [Chapter 6, "Reliability Systems: A Maintenance Aid"](#). If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the opening description for a complete explanation.

- **SPE-Select Lead Change:** (High or Critical Reliability system only)
The system could not determine why the SPE changed its status from Active or Standby. However, this change usually indicates a transition from Active to Standby. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **SPE-Select Switch:** (High or Critical Reliability system only) The SPE-Select switches on the Duplication Interface circuit packs were thrown to select the Standby SPE, which became the Active SPE, using the restart level shown. It is also possible to get an initialization cause of SPE-Select Switch when SPE B is active and power to carrier B is lost. In this case, an SPE switch to SPE A occurs and the initialization cause can show either SPE-Select Switch or SPE Down. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of [“display initcauses”](#) for a complete explanation.
- **Stby-SPE Core Dump:** (High or Critical Reliability system only) The Standby SPE had finished a core dump when an interchange took place that made the Standby SPE the Active SPE. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of [“display initcauses”](#) for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Stby-SPE Tests:** (High or Critical Reliability system only) The Standby SPE was in the process of running tests at the request of the Active SPE when an interchange occurred. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of [“display initcauses”](#) for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Unknown:** A restart that could not be classified. The Software Error Log may contain more information about the restart.
- **Upgrade Software:** (High or Critical Reliability system only) This indicates that the system was upgraded to a new software generic using the Standby SPE to load the new software via the **upgrade software** command. A system technician-requested **reset system 4** command should be the previous entry.

- **LMM Put Fail:** This initcause occurs when the LMM has failed to place the request for initcause message in the DPR. This could occur if the MTP does not respond to the DPR handshake. Level of Restart: Warm (escalation turned on).
- **LMM Get Fail:** This initcause occurs when the LMM does not receive a response to the request for initcause message from the MTP. This could occur if the MTP is not taking messages out of the DPR. Level of Restart: Warm (escalation turned on).
- **Dupint Unknown:** This initcause occurs when the LMM receives an UNKNOWN initcause from the Dupint. This could occur in a High or Critical Reliability System where the MTP thinks a PEI has occurred but the dupint disagrees. Level of Restart: Warm (escalation turned on).
- **MTP Reset Unknown:** This initcause occurs when the LMM has reset the MTP during the process of trying to get initcause from the MTP. Level of Restart: Warm (escalation turned on).
- **S-vintage Mismatch:** This initcause occurs when a mismatch in the duplication super vintage is detected by the LMM. Level of Restart: Reboot (no escalation).
- **Monitor Reset:** (For Development Environment Only) This initcause occurs when "ini 1" is executed from the Flash Monitor. This initcause can occur only in systems with SBB. Level of Restart: Reboot (no escalation).
- **Bad GDT:** (For Development Environment Only) This initcause occurs when the LMM fails to transfer control to Oryx/Pecos because of absence of entry in GDT to point at O/P. This usually occurs in a system with no data. Again, this should only occur in systems with SBB.

Action The level of recovery performed by the system. The recovery levels are:

- Reset system 1 (Warm)
- Reset system 2 (Cold-2)
- Reset system 3 (Cold-1)
- Reset system 4 (Reboot)
- Reset system 5 (Extended Reboot)
- Reset system interchange (High or Critical Reliability System only - hot restart interchange)

Escalated Whether the restart was escalated to a higher level to clear the problem. There is a software escalation strategy that can cause a higher level of restart than the one previously performed to be executed if the need arises.

Carrier The "carrier" statement indicates the carrier on which the recovery was performed (possible values are **1A** and **1B**). In most cases, this "carrier" is the Active SPE carrier when the restart occurs. However, it is possible in a High or Critical Reliability System that this carrier was the Standby carrier. See the preceding description of "[display initcauses](#)" for a complete explanation.

Time The date (month and day) and time of the restart.

display memory-configuration

This command indicates the total memory available for the active, and if present, the standby processor(s). This command is a single page display with hidden fields for the standby-processor, if available.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display memory-configuration	long	Displays the standby SPE Flash ROM and DRAM configuration.	init	none	none
	print	Report sent to printer	inads craft cust		
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display memory-configuration display memory-configuration long	browse		

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following output example is for the **display memory** command.

```

display memory-configuration                               SP_A
                PROCESSOR MEMORY-CONFIGURATION
                (M bytes)

                SPE_A   SPE_B

Flash ROM:      16

Total DRAM:    12

SIMM A:        4
SIMM B:        4
SIMM C:        4
    
```

Field descriptions (page 2)

Name	Non-specific node name (up to 15 characters each) for CMS nodes, DCS nodes, and so forth. Valid entries are alpha-numeric and/or special characters for identification.
IP Address	IP address for the adjunct or switch. Enter 0 - 255 or leave blank (default).

display port

This command displays the port location, the equipment connected to the port, and the means by which the port can be identified (for example, an extension number, the trunk group and member, and so on).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display port	<i>location</i>	Port address (PCSSpp)	init	none	none
	<i>print</i>	Report sent to printer	inads craft cust browse		
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display port 1c0801 display port 1c0802 print display port 2c1504 schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output for the **display port 1c0801** command.

```
display port 1c0801                               SPE A

          PORT INFORMATION

          Port: 01C0801
          Equipment Type: Station
          Identification: 1021
```

Field descriptions

Port:	Port address (cabinet-carrier-slot-circuit)	
Equipment Type:	Hardware that is physically connected to the specified port.	
Identification:	Depends on the hardware that is physically connected to the port:	
	If hardware is	The field contains
	station	station extension
	trunk	trunk group and member number)
	modem pool	modem pool group number

display synchronization

This command calls up the synchronization form where the administered synchronization stratum and reference sources are displayed. (No changes can be made to the system synchronization with this command.)

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display synchronization	<i>print</i>	Report sent to printer	init inads craft cust rcust bcms browse	none	See below
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display synchronization display synchronization print display synchronization schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

- A DS1 interface or a UDS1 board that has been selected as either a primary or secondary synchronization source cannot be removed on the DS1 circuit pack administration form or the regular circuit pack administration form.

Output

The following example shows the output for the **display synchronization** command.

```
display synchronization                               Page 1 of 2
SYNCHRONIZATION SOURCE (DS1 circuit pack location)
    Stratum: 4
    Primary:           Secondary:
DS1 CIRCUIT PACKS
Location  Name      Slip      Location  Name      Slip
02B10 D92D1 ds1 2b10  n
02B11 d92D1 ds1 2b11  n
01C10 D92D1 ds1 1c10  n
01C11 D92D1 ds1 1c11  n
NOTE: TN722B DS1 sources result in stratum 4, type II synchronization
```

Field descriptions

- Stratum:** Synchronization stratum that is used (3 or 4)
- Primary:** First choice system synchronization source (blank = no synchronization); valid only if stratum 4 synchronization specified
- Secondary:** Second choice system synchronization source (blank = no synchronization); valid only if stratum 4 synchronization specified
- Location:** Circuit pack location (cabinet-carrier-slot) of all administered DS1 circuit packs are listed here.
- Name:** User-defined name administered for the DS1 circuit pack. Blank means no user-defined name administered.
- Slip:** If the DS1 circuit pack has slip alarm, field shows *y*; otherwise it shows *n*.
- Port Network:** Only valid for stratum 3 synchronization; specifies the port network supplying synchronization through the tone clock circuit pack.

display system-parameters duplication

This command displays the status (enabled or disabled) of Switch Processing Element (SPE) and Port Network Connectivity (PNC) duplication. The following must be duplicated:

- Each switch node record and every switch node with its duplicate (cabinet administration is a prerequisite)
- Every fiber link containing either an expansion interface circuit pack as an endpoint, or a DS1-C (fiber link administration is a prerequisite; circuit pack administration then follows duplication administration)

All nonduplicated switch node interfaces (SNI) to SNI fiber links are automatically duplicated.

NOTE:

You must enable (y) the PNC Duplication field on the customer options form (**change system-parameters customer-options**) before you can do any duplication administration.

PNC Duplication cannot be enabled until all pnc-a and pnc-b boards are released from the “busyout” state.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display system-parameters	duplication	SPE or PNC duplication Examples: display system-parameters duplication	init inads craft	none	none

Output

The following example shows the output from the **display system-parameters duplication** command.

```

                                                                    Page 1 of 1

Field descriptions

Defaults for data entry fields are listed in parentheses.

Product Identification	10-digit number (starting with 1) that identifies the switch to an Operations Support System (OSS), for example, INADS.
First OSS Telephone Number	First telephone number that the switch dials to report alarms; must be obtained from the National Customer Support Center (NCSC) or the TSC. (# and * are not allowed)
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the first OSS. (yes)
Second OSS Telephone Number	Second telephone number that the switch dials to report alarms; must be obtained from the National Customer Support Center (NCSC) or the TSC. (# and * are not allowed)
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the second OSS. (no)

8 Maintenance Commands and Trouble-Clearing Aids
display system-parameters maintenance

8-94

Alarm Origination to
OSS Numbers

One of four options for alarm origination (neither):

- If *both*, all Major and Minor alarms result in an automatic call to both OSS telephone numbers. Both OSS telephone numbers must be administered.
- If *first-only*, all Major and Minor alarms result in an automatic call to the first OSS number only. The switch does not call the second OSS telephone number even if the number is administered. The first OSS telephone number must be administered
- If *neither*, alarm origination does not take place. Warning alarms are not reported to either numbers.
- If *second-as-backup*, all Major and Minor alarms result in an automatic call to the first OSS telephone number. If calling the first OSS telephone number fails four attempts, the switch starts to call the second OSS telephone number as a backup until calling the first OSS telephone number becomes successful. Both OSS telephone numbers must be administered.

Before Release 5, the name of this field is *Alarm Origination Activated*. If Alarm Origination is deactivated, both Cleared Alarm Notification and Restart Notification are disabled, even though they may still be activated in the administration.

Cleared Alarm
Notification

Enables the switch to originate a call to the OSS and send an alarm resolution message whenever all previously-reported Major and Minor alarms are resolved. Alarm Origination must be activated in order for Cleared Alarm Notification to work. (no)

Restart Notification

Enables the switch to originate a call to the OSS and report any system restarts caused by problems with the switch.

Suspension Threshold

The threshold for suspending Cleared Alarm Notification (1-15). Some problems may cause alarms to be generated and then resolved repeatedly. To detect these problems (by not sending additional Cleared Alarm notifications to indicate a problem-free system), the switch suspends Cleared Alarm Notification when it has reported this administrable number of Cleared Alarm notifications in a 24-hour period. A suspended Cleared Alarm Notification is only enabled again with a successfully completed "logoff" command, a system reset, or when the threshold is changed. This field is irrelevant if Cleared Alarm Notification or Alarm Origination is disabled.

Test Remote Access
Port

Specifies whether testing of the remote access port on the SYSAM circuit pack is enabled. This field should read *yes* whenever there is an INADS line connected to the switch and there is a maintenance contract in effect so that alarm origination capability is maintained.

8 Maintenance Commands and Trouble-Clearing Aids
display system-parameters maintenance

8-95

CPE Alarm Activation Level Indicates the minimum level (Major, Minor or Warning) at which the Customer-Provided Equipment (CPE) alarm is activated. If the level is *none*, the CPE does is not activated for any alarm. (none)

NOTE:

The CPE alarm is always activated when the switch goes into Emergency Transfer, regardless of the CPE Alarm Activation Level setting.

Packet Bus Activated Enables the system Packet Bus. If this field reads *yes*, then maintenance software assumes that there is a Packet Control circuit pack installed in the system. The packet endpoints (for example, ASAI, and/or BRI) may be administered, and maintenance testing runs on both the Packet Control circuit pack and on the Packet Bus (This field should read *yes* after a packet control circuit pack is installed.). If a Packet Control circuit pack is not installed in the system, then a major alarm is raised against the PKT-CTRL MO. This field can only be changed from *yes* to *no* if there are no packet endpoints administered, thus ensuring that there can be no packet endpoints administered if the packet bus is not activated.

This field should be set to **yes** after a Packet Control circuit pack is installed.

If a Packet Control circuit pack is not installed, then this field should be set to "no" (the only exception is when setting up translations for a system for which not all of the required hardware is available). (no)

Customer Access to INADS Port Provides the capability to prohibit access to system administration and maintenance interface, via the INADS port when using customer login ID's. This field can only be activated by Lucent services through system-parameters maintenance administration. (no)

Repeat Dial Interval (MMS) Indicates the number of minutes that the system must wait before attempting another call origination to an OSS. This timer is triggered by the lack of a far-end acknowledgment. (7)

Scheduled Maintenance

A series of maintenance tests and operations runs automatically every day according to the schedule and settings specified in the following fields.

Start Time The hour and minute (24-hour notation) at which daily scheduled maintenance begins. (22:00)

8 Maintenance Commands and Trouble-Clearing Aids
display system-parameters maintenance

8-96

Stop Time	Time (hour and minute) when scheduled daily maintenance stops. If any daily maintenance operations are not completed by this time, the system notes where in the sequence it stopped and performs those operations during the next scheduled daily maintenance.
Daily Maintenance	The series of tests that are always run by maintenance software as part of daily maintenance. (display-only field)
Save Translation	This field indicates on which days translation data in memory is automatically saved to the flash card, MSS disk, and/or tape devices during scheduled maintenance. On systems with duplicated SPEs, translation data is saved on both SPEs. Valid entries are daily , days of the week, or no . "No" specifies that no automatic saves are to be executed. (daily)
Control Channel Interchange	Each port network has a pair of TDM busses called A and B, each of which has a set of time slots dedicated to use by the control channel. At any one time, the control channel in each PN is carried on only one of the two busses. This field indicates on which days the control channel in each port network will be switched from one of the paired TDM busses to the other. Valid entries are daily , days of the week, or no . "No" specifies that no interchange be executed. (no)
System Clocks Interchange	On High and Critical Reliability systems, this option causes a Tone-Clock interchange in each port network with duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the Tone-Clock that was originally active. This field indicates on which days the interchanges are to take place. Valid entries are daily , days of the week, or no . "No" specifies that interchanges be executed. (no)
SPE Interchange	On systems with duplicated SPEs, this field indicates on which days an SPE interchange will be executed during scheduled maintenance. Valid entries are daily , days of the week, or no . "No" specifies no scheduled interchanges. (no)
EXP-LINK Interchange	This field indicates whether or not the expansion links between port-networks are interchanged as part of scheduled maintenance. The value "daily" means that EXP-LINK interchange occurs automatically everyday. The value "no" means that EXP-LINK interchange is not done automatically as part of scheduled maintenance. Values represented by the days of the week mean that EXP-LINK interchange occurs automatically on the specified day only. Since EXP-LINK interchange only applies to duplicated systems, simplex systems do not display this field. (no)

8 Maintenance Commands and Trouble-Clearing Aids
display system-parameters maintenance

8-97

Minimum Threshold for TTRs	When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV. These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748, TN718, TN420, or TN756; TN2182 and TN744 (suffix C or later) each have 8 TTRs. To alarm the first occurrence of a TTR being taken out of service, set this field to the total number of TTRs in the switch.
Minimum Threshold for CPTRs	When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV. These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748, TN718, TN420, or TN756; TN2182 and TN744 (suffix C or later) each have 8 CPTRs. To alarm the first occurrence of a CPTR being taken out of service, set this field to the total number of CPTRs in the switch.
Minimum Threshold for Call Classifier Ports	When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV. Valid entries are 1 to 200. There are 8 ports on each TN744 or TN2182 circuit pack. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to the total number of CLSFY-PTs. If there are no TN744 or TN2182 circuit packs in the system, leave this field blank.
Test Type 100, Test Type 102, Test Type 105	An extension assigned to receive tie-trunk calls from other switches with test line origination capability. The system responds by sending a sequence of test tones. Test Type 100 tests far-end to near-end loss and C-message by sending: <ul style="list-style-type: none">■ 5.5 seconds of 1004 Hz tone at 0dB■ Quiet until disconnect; disconnect is forced after one minute
ISDN-PRI Test Call Extension	The extension used by a far-end ISDN node to place a call to the system to test the ISDN-PRI trunks between the far-end and the system.
ISDN-BRI Service SPID	This field shows whether or not the link is associated with the Service SPID. If the link is associated with the Service SPID, this field contains a "yes" and the extension field is blank; otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.

display system-parameters maintenance

8-98

DSO Loop-Around
Test Call
Extension

Extension number for the test call. This test extension number is used to establish a loop-around connection on the selected trunk.

The DSO Loop-Around Test Call feature is used primarily for testing DSO channels associated with non-ISDN-PRI trunks. The loop-around is activated by dialing the test extension number. Multiple DSO Loop-Around connections can be set up by placing multiple calls to the loop-around extension.

The DSO Loop Around feature provides a loop around connection for incoming non-ISDN DS1 trunk data calls. This feature is similar to the far-end loop around connection provided for the ISDN Test Call feature. This DSO loop around is provided primarily to allow a network service provider to perform facility testing at the DSO level before video teleconferencing terminals are installed at the PBX.

The feature is activated on a call-by-call basis by dialing a test call extension specified on the second page of the System Parameters Maintenance form. No special hardware is required. When the test call extension is received by the PBX, a non-inverting, 64 kbps connection is set up on the PBX's Time Division Multiplexed bus. More than one loop around call can be active at the same time.

For calls routed over the public network using the ACCUNET Switched Digital Service (SDS) or Software Defined Data Network (SDDN), the data transmission rate is 56 Kbps, since robbed bit signaling is used. For calls established over a private network using common channel signaling, the full 64 kbps data rate is available.

When the incoming trunk group is used only for data calls (SDS), the Communications Type on the associated Trunk Group form should be set to "data." When the incoming trunk group is used for robbed bit alternate voice and/or data (SDN/SDDN), the Communications Type on the Trunk Group form should be set to "rbavd" (robbed bit alternate voice data). For private network trunks using common channel signaling, the Communications Type on the associated Trunk Group form can be set to "avd."

Loss Plan

Use only when extra loss is required to maintain quality of transmission on conference calls. Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below.

No. of Parties to Be Conferenced	Enter Digit
3	2
4	3
5	4
6	5
7	6

SPE Optional Boards:

These fields indicate whether a Disk circuit pack is present in the system, and which Packet Interface slots are administered. If a Packet Interface circuit pack is physically present, the corresponding Packet Interface field is set to **y** when the system boots, and no change to that field is allowed. If the system is equipped with duplicated SPEs, a Packet Interface field is set to **y** when either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, then the value for the Packet Interface field is read from translation data stored on disk or tape. If the field is set to **n**, a Packet Interface circuit pack may be administered by changing the corresponding Packet Interface field to **y**.

Modem Connection

On page 3 of the example forms shown below, there are 11 fields that are hidden when the `Modem Connection?` field is set to **internal**. In this example the `Modem Connection` field is set to **external** and these additional 11 fields are visible.

The first 2 fields on page 3 help setup the data format for the serial data from the switch to the modem. The field names are `Data Bits:` and `Parity?`. There are only two valid combinations for these 2 fields:

- Data Bits = 8, Parity = None
- Data Bits = 7, Parity = (odd, even, mark, or space)

The remaining fields are listed below:

<code>Modem Connection</code>	Valid entries for this field are "internal" or "external". The default is set to internal. (internal)
<code>Modem Name</code>	This field is 20 characters long and will permit alpha-numeric characters to provide a unique qualifier for a given modem. ()
<code>RTS/CTS Enabled</code>	This field will inform the modem that communication with the data source UART will be driven with RTS/CTS flow control. This field is 6 characters long and is case in-sensitive. (\Q3)

8 Maintenance Commands and Trouble-Clearing Aids
display system-parameters maintenance

8-100

Asynchronous Data Mode This field will configure the modem as an asynchronous communications device. This field is 8 characters long and is case in-sensitive. (&M0&Q0)

DTE Auto-Data Speed This option will adjust the speed of the data source (DTE) UART to the outgoing (modem-to-modem) data rate. So, at maximum this speed would be 9600 baud. This field is 6 characters long and is case in-sensitive.

Note that this field sets the link speed between the switch and the modem. It does not set the speed of the modem. It is not desirable to have the serial data fill the modem buffer faster than the outgoing data rate especially because data compression is disabled. ()

Disable Data Compression This field will turn off the default data compression algorithms that are in use by most consumer modems. This field is 6 characters long and is case in-sensitive. ()

Enable Error Control This field will turn on the V.42 LAPM and MNP error control protocols, if available on the modem. This field is 6 characters long and is case in-sensitive.

This V.42/MNP/Buffer mode first attempts to negotiate V.42 error control with the remote modem. If this fails, then the modem transitions to MNP, and if this fails then no error control is used. ()

Misc. Init. Param This field supports any initialization parameters that are not already specified. The AT commands specified in this free-form field will be always the last initialization parameters to be sent to the external modem. This field is 20 characters long and is case in-sensitive. ()

Auto-Answer Ring Count This field controls the number of rings required before the modem automatically answers an incoming call, if and only if the switch doesn't answer first. (If the switch is healthy, it answers an incoming within the first few rings.) This field is 6 characters long and is case insensitive. Typically, the maximum permissible value for this register is 255. The values 1-255 denote the number of incoming ring cycles. (S0=10)

⇒ NOTE:

The number of rings is optimally set above 5, and if at all possible, keep the default of S0=10.

Dial Type This field controls the type of inter-register signaling to be used between the modem and the Central Office. Use "T" for tone dialing and "P" for pulse dialing. The field length is be 3 characters long and is case in-sensitive. This field will be concatenated with the dial string. (T)

8 Maintenance Commands and Trouble-Clearing Aids
display test-schedule

8-101

Adjustable
Make/Break Ratio

This field can be of particular importance when using a modem that may be transferable from country to country. The intent of this field is to control the make/break ratios of pulses and DTMF dialing. The Intel product information has support for the different make/break options for pulse dialing only.

Intel uses the option "&P0" to select a ratio of 39% make and 61% break for communication within the U.S. and Canada. The option "&P1" sets a ration of 33% make and 67% break for the U.K. and Hong Kong.

This field is 5 characters long and is case in-sensitive. ()

Dial Command

This field simply denotes the dialing command of the modem. This is a fairly standard command. (D)

No Answer
Time-Out

Most off-the-shelf external modems provide a timer that abandons any outbound data call after a predetermined interval. Some modems provide for this timer to be disabled, thus allowing an outbound call to ring indefinitely. AT&T Paradyne does not provide this capability with their modem line, because it is generally undesirable to have an outbound call attempt ring indefinitely.

The internal modem must have this parameter disabled or set to at least 255 seconds.

This is a non-administrable parameter. For the external modem connection, this parameter will be the first initialization string to be transmitted to the external modem. This field will be visible on the administration form in display mode only.

This hardcoded constant can be overridden for type approval applications, specifically in the U.K and other Western European nations, by the use of the "Misc. Init. Param:" field. (S7=255)

display test-schedule

Automatic Transmission Measurement System (ATMS) provides advanced maintenance procedures for monitoring system trunk facilities. This system performs transmission tests on system trunks to determine if trunks are performing satisfactorily. These tests can be initiated in two ways:

- | | |
|-----------|---|
| demand | user enters command at the System Administration Terminal (SAT) to initiate a test immediately |
| scheduled | schedules tests through a schedule form to automatically initiate tests at a predetermined time |

Output

The following is the output from the **display test-schedule *n*** command.

Field descriptions

- Schedule** The current schedule number.
- Schedule Time** The hour and minute that the test begins (24-hour time, with "00:00" being midnight). This time must be greater than the current time.
- Schedule Date** Month (**1 to 12**), day (**1 to 31**), and year on which testing begins (default is the system date). This date must be equal to or greater than the current date.
- Schedule Test Days** A **y** next to the days of the week indicates which days of the week this test runs.
- Interval** The length of this schedule in weeks. If this field is **0** (default), the schedule runs on the specified days only once.
- OTL Throttle** The number of concurrent tests run within a schedule. This guarantees that all trunk members within a schedule are tested serially or if multiple trunk members are tested from the same schedule.

Test Type	<p>One of the following types of test to be performed on the trunk group/members in this schedule:</p> <ul style="list-style-type: none">■ full (default) runs the most comprehensive test and collects all associated measurements for each TTL type.■ supv performs a supervision test and only confirms the presence of the test set at the far end. No measurements are taken for this test.■ no-st runs the "full" test, but skips any self-test sequences. This saves about 20 seconds on the type 105 test and does not have any effect on type 100 or 102 tests.■ no-rl runs the "full" test, but skips any return loss sequences. This saves about 20 seconds on the type 105 test and does not have any effect on type 100 or 102 tests.■ no-st/rl runs the "full" test, but skips all self-test and return loss sequences. This saves about 40 seconds on the type 105 test and does not have any effect on type 100 or 102 tests.
Duration	<p>The maximum number of hours (1 to 24) a schedule can remain active. Schedules continue to run until all trunk group/members for that particular schedule are tested or until the schedule duration is reached. If the duration is reached before all trunk groups/members can be tested, the schedule stops.</p>
Trk Trp	<p>The trunk group numbers to be tested when this schedule runs. There is no limit to the number of times that a trunk group can appear on any particular schedule, or to the number of different schedules in which a trunk group can appear. Default is blank.</p>
Bgn Mbr	<p>The beginning member number of the trunk group to be tested; default is 1.</p>
End Mbr	<p>The ending member number of the trunk group to be tested. This value must be greater than or equal to the value of the beginning member field.</p>

display time

The **display time** command brings up the time form. The system time displays on this form. This command does not allow for any changes to be made to the system time.

8 Maintenance Commands and Trouble-Clearing Aids
display time

8-104

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
display time	print	Report sent to printer	init inads craft cust browse	none	Date and time are generally used by the switch.
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: display time display time print display time schedule			

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output for the **display time** command.

```
display time

                DATE AND TIME

DATE
Day of the Week:  Sunday           Month:  January
Day of the Month:  1              Year:   1990

TIME
                Hour:  6           Second:  20
                Minute: 8
```

Field descriptions

- Day of the Week The day of the week that the system has stored.
- Day of the Month The numerical day of the month.
- Month The month of the year stored by the system.
- Year The current year stored by the system.
- Hour The hour of the current day.
- Minute The number of minutes into the hour.
- Second The number of seconds into the minute stored by the system.

download update-file

The update file is transferred to the switch asynchronously from either an INADS host or a personal computer (PC) using the XMODEM protocol.

Remote download

Remote users can dial into the switch by either using the “call” command (from an INADS host) or by dialing the switch directly with a modem. Once the connection has been established, the user logs into the switch as a remote system access terminal (SAT) using the inads login.

NOTE:

Only the INADS and INIT logins have the necessary permission to send an update file to the switch.

1. Type the **download update-file** command and press ENTER. Please `wait...` displays on the screen.

After completing some initialization, `Please start file transmission now...` displays.

2. Start an XMODEM session on the remote end and send the update file.
 - a. INADS host: enter **~dload <file_name>** to start the file transmission.
 - b. PC: follow the instructions in the emulator’s manual for invoking an XMODEM session to send the update file.

Each block is written to tape or flash card as it is received by the switch. The link level of XMODEM provide error detection and retransmission. Additional protection is provided within the application level. After the entire file has been written to tape or flash card, it is read back and each update file block is validated, and the file checksum is also checked. If the file appears to be sound, the status word in the header block is changed to indicate that it is a valid update file.

There may be a delay (up to 5 minutes on a duplex system) between the end of the file transmission and command completion. This delay is caused by the patch application of any immediate sub-patches and, if on a duplex system, the automatic copy of the update file to the standby SPE, which takes place after receiving a valid update file.

In a High or Critical Reliability System, the connection to the INADS host computer can be dropped by the INADS side, but the process of copying the patch file to the standby processor continues. The standby is placed in maintenance mode and a call placed between active and standby SPE over the data channels. The file is transmitted in the same way for both tape and flash card systems. The same checks are made on the receiving side as were made

during and after the original download. If no errors are found, the file is marked valid.

There is no feedback to the user on the status of the standby copy. If an error is encountered during the copy or validation process on the standby, an error is logged in the software error log. Because the data consistency audit discovers that the two patch files are inconsistent, the user must manually copy the valid file on the active processor over to the standby processor.

The software does not indicate when the copy has completed, so scripts run by the TSC must not issue an immediate reset on High or Critical Reliability Systems. This interrupts the copy and guarantees that the field update files on the two processors are inconsistent. This problem can be avoided by using one of the following techniques:

- Use two scripts: the first to apply the patch and a second (run later) to issue the reset that applies the patch. This requires two calls to each duplicated switch.
- Put a delay into the scripts, causing the scripts to wait a period of time after downloading the file and before issuing the reset. This requires only one call, but the amount of delay time required is not well defined, as it varies by system load.
- Use a manual means of detecting when the copy has completed: either a "PASS" on the data consistency audit or a match on the List Configuration Software form. This requires only one call and introduces less delay in requesting the reset.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
download update-file			init inads	none	See below

Feature Interactions

- The form displayed for the list configuration software-vintage command has been modified to reflect the changes imposed by the flash architecture. The **list configuration software** command allows INADS to determine with one query the hardware configuration, software vintage, and patch identifier.
- There is no interaction with routine periodic or scheduled maintenance, because patches are only applied on restarts before the system is in normal operation.
- The flash checksum test acts as a backup check to ensure that the entire field update file was applied correctly. It can fail because of a bad checksum update from a poorly constructed update file or because the patching operation has aborted. When the flash Checksum Test fails, a MAJOR on-board alarm is raised on the processor/memory circuit pack. Maintenance runs a data consistency test on a daily basis to check that

copies of translations, announcements and software files are consistent across both processors in a High or Critical Reliability System. If the test detects a difference, a minor, off-board alarm is generated.

- When checking the software, the test compares the memory resident software version and patch identifier. It also checks for the presence of a field update file and, if found, compares the old and new patch identifiers to make sure the same patch file id loaded on each processor. If the software or update files are inconsistent, the **list configuration software** command can be used to display the status of the patch file.

Recovery procedures

In the event of a failure encountered during the download and application of the update file, follow the recommended recovery procedures. The instructions apply to both simplex and duplex switches; additional detail is given when needed.

Error on the download transmission

If the error displayed on the terminal indicates that the download step in the process failed, there are several culprits:

1. The transmission line could have been noisy. Retry after making all the following checks. Failed attempts take up room in the hard patch file and may require a warm start to clear the file.
2. The user may have downloaded the tape/MIPS version of the patch instead of the flash version.
3. The vintage of the update file may not match the vintage of software currently running in the system. Check the customer's vintage using **list configuration software** and patch vintage provided in the documentation.
4. The switch may have had difficulty in writing to the hard patch file. Check the hardware error log for processor/memory board failures.
5. The hard patch file may be full. Issue a **reset system 1**. This should cause valid files to be applied and invalid ones to be erased.

Error on Application of the Patch

A patch may not have been applied for the following reasons:

1. The memory card is write-protected. Remove this protection and issue a **reset system x** command.
2. The patch identifiers are inconsistent. Run **list configuration software** and compare the old patch identifier with the values in the update file.

3. The LMM encountered a problem with the patch file. This is unlikely because the same checks (and more) were performed when the file was downloaded, prior to marking the file valid. This implies that the memory that stored the update file was corrupted.
 - a. Apply the back out file immediately to back out the changes.
 - b. Run the flash checksum test to make sure the system is back to its prepatch state.
 - c. Check the validity of the file again.
 - d. Try redownloading and applying the patch immediately.
4. The LMM reports a hard error. Symptoms of this are an entry in the hardware error log for the processor/memory board (if you're lucky), or extremely odd switch behavior followed by SPE down mode (if you're not). The problem is that the LMM cannot complete the programming of memory with the result that memory is in a corrupted state. The only recovery is to get or order new software and processor/ memory circuit packs.

In a High or Critical Reliability System, the failure causes a interchange to the standby processor. The hardware on the standby must be repaired and the patch redownloaded. (There was nothing wrong with the patch.)

Good application - bad patch

This error is not caused by a failure in the download or application, but by a fault in the patch file itself. To recover from this type of problem, the back out file that backs out the patch should be downloaded and applied. This requires that the system be sane enough to receive the file correctly and be able to apply it.

In a High or Critical Reliability System, the user has approximately 8 minutes to recognize that a problem exists and force an interchange to the standby processor. If this can be done, the file on the newly-active processor can be invalidated using a file containing a destroy tuple or the *wp byte* command. The standby processor can be restored to a normal state using the back out file.

Inconsistent software versions on a duplicated switch

As indicated by a failure in the data consistency test, inconsistent software can be caused by problems in copying the update file to the standby or validation test failures on the standby. Unlike the tape or MIPS systems which revert to the same version of software as a result of a refresh, a flash system remains inconsistent until some manual intervention occurs:

1. Use the **list config software** command to determine the status of the vintages, patch identifiers, and patch file data on both the active and standby processors.

2. If one processor looks as if it has been patched (updated patch identifier and no update file) and the other looks as if the patch file is still present (no patch identifier and valid update file), the application of the patch can be forced by making that processor active and requesting the system restart indicated in the accompanying documentation.
3. If one processor has a copy of the update file and the other doesn't (neither has been patched), the file can be copied using the **copy update-file** command.
4. If patch identifiers disagree but neither side has a valid update file, the missing patch should be redownloaded to the system. During the download process, the file should pass the vintage test and then be copied to the standby processor. Validation tests are then be run on both processors. The patch is applied to memory on the next restart. This procedure is less disruptive to the customer if the unpatched processor is the standby at the time of the restart.

enable administered-connection

This command restarts scheduled and periodic maintenance for a single or all administered connections and can be used to track the maintenance processing of administered connections without interference from other maintenance processing. This command also restarts the processing of in-line errors for all or the selected administered connection.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
enable administered-connection	<i>ac number</i>	The number of the administered connection	init inads craft cust rcust mis	none	none
	<i>all</i>	All administered connections are enabled. Examples: enable administered-connection 128 enable administered-connection all			

enable mst

Enables the message trace that is controlled according to the parameters created with the **change mst** command. If executed while the trace is enabled, the command has no effect and returns a screen message indicating that the command was successful.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
enable mst			init inads	none	none

enable suspend-alm-orig

This command enables Suspend Alarm Origination for a board (including all ports and endpoints on the board) or for a port (including all endpoints on the port) for both on- and off-board alarms or for off-board alarms only. Many control circuit packs do not have a board location, so this command cannot support all circuit packs. Each enable command becomes a new entry or replaces an existing entry in the Suspend Alarm Origination table. A new entry that matches both the physical location and off-only, on-, and off-board specifications of an active entry replaces the active entry in the Suspend Alarm Origination table.

This command may be particularly useful for:

- Improved control over customer requests. For example, to suspend off-board DS1 alarms temporarily for customers who periodically disconnect DS1 trunks for testing or other business-related purposes.
- Improved control over external (non-Lucent) problems such as suspending off-board DS1 alarms before a customer resolves facility problems (for example, a T1 trunk that has developed an off-board condition).
- Improved control over internal (Lucent) problems that cannot be resolved immediately. For example, the command can be used to suspend Alarm Origination for a bad circuit pack detected late Friday night when dispatch personnel cannot respond until Monday.

NOTE:

Also see other Suspend Alarm Origination related commands, including **disable suspend-alm-orig** and **list suspend-alm-orig**.

Action/ Object	Qualifiers	Qualifier Description	Permissions	Defaults	Feature Interactions
enable suspend-alm-orig	board/port location off-board-only expires-in-hrs	Physical location of the hardware optional; if not specified, both on-and off-board alarms suspended No. of hours (1-72) Examples: enable suspend-alm-orig 1B03 expires-in-hrs 3 enable suspend-alm-orig 1B0701 expires-in-hrs 72 enable suspend-alm-orig 1B07 off-board-only expires-in-hrs 24	init inads craft cust rcust	Both on- and off-board alarms if the off-board-only keyword is not specified	none

enable synchronization-switch

This command re-enables automatic clock switching or returns the maintenance subsystem back to the normal state. The synchronization subsystem consists of the TDM bus clock, DS1 trunk board, and SPE-resident maintenance and administration software and provides error free digital communication between the switch and other PBXs, COs, or customer-premise equipment (CPE).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
enable synchronization-switch			init inads craft	none	none

enable test-number

This command enables a previously disabled test number. At the next request by maintenance or the technician, this test number runs.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
enable test-number	<i>number</i>	The test number to re-enable Example: enable test-number 102	init inads craft	none	The display disabled-tests command gives a list of all disabled tests.

format card-mem

This command erases and formats the active processor Flash Read-Only Memory card before writing translation, announcements, coredump, and firmware data.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
format card-mem	<i>translation</i> <i>announcements</i> <i>coredump</i> <i>firmware</i>	Erases and formats the memory card for: translations only translations and announcements translations, announcement, and coredump translations, announcements translations, announcements coredump, and firmware	init inads craft cust browse system	none	none

Output

The server shows the active SPE and returns `Command completed successfully` if completed.

get vector

This command displays the conditions and the Switch Processing Element (SPE) associated with a core dump of memory to tape or memory card. The dump occurs on the tape or disk of the previously active SPE or the SPE previously specified using the **set vector** command in systems with duplicated SPEs.

CAUTION:

The vector is cleared when a system restart of the proper level is performed regardless of whether the core is actually dumped.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
get vector	long	Core dump timestamps printed; if SPEs are duplicated, timestamps are printed for both SPEs.	init inads craft	none	none
	print	Report sent to printer. Examples: get vector get vector print get vector long get vector long print			

Output

```
get vector
```

```
GET RESULTS
```

```
Core Dump Vector          Set Vector Command Option
    0                      spe-active

Field descriptions

Core Dump Vector

A hexadecimal value representing the condition(s) that cause(s) a core dump. This hexadecimal value is a bit map of the four reset conditions (from least to most significant bit):

- warm start
- cold 2 restart
- cold 1 restart
- reboot

A value of 0 indicates that the vector is cleared or not set. See the Vector-Condition Mapping table that follows.

Vector-Condition Mapping

value	warm-start	cold-2	cold-1	reboot
0	n	n	n	n
1	y	n	n	n
2	n	y	n	n
3	y	y	n	n
4	n	n	y	n
5	y	n	y	n
6	n	y	y	n
7	y	y	y	n
8	n	n	n	y
9	y	n	n	y
a	n	y	n	y
b	y	y	n	y
c	n	n	y	y
d	y	n	y	y
e	n	y	y	y
f	y	y	y	y

Set Vector Command
 Option

The user-specified SPE prior to the core dump. For simplex SPE systems this field is always *spe-active* unless the vector is cleared or not set. In duplex SPE systems, the field is either *spe-active* or *spe-standby* unless the vector is cleared or not set. If the vector is cleared or not set in either a duplex or simplex SPE system, this field is blank.

Core Dump Time

The time of the core dump for SPE A and SPE B. If the system has a simplex SPE, a timestamp for SPE A (or the active SPE) and non duplicated SPE" are displayed for SPE B. If the core dump cannot be accessed, *can't access* displays for the corresponding SPE. For example, in a High or Critical Reliability System where SPE B is not refreshed, SPE B displays *can't access* instead of a timestamp. If the MSS device storing the core dump timestamp is busy for any reason, *device busy* displays at the terminal.

list configuration

Hardware configuration reports list, for each circuit pack in the group specified, the type, code, suffix, and vintage of the requested circuit packs as installed in the switch, and all ports assigned to the circuit pack.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list configuration	hardware-group	Enter a group listed in the Hardware Groups section below.	init	none	none
	print	Report sent to printer.	inads craft cust rcust		
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list configuration carrier 2c schedule list configuration port-network 5 schedule list configuration stations print schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

NOTE:

The **list configuration software-version** command is discussed separately under its own heading.

Hardware Groups

Enter one of the following hardware groups:

`carriers all` Displays all circuit packs administered and/or physically inserted in the port, switch node, and control carriers on the system.

board PCSS	Displays all assigned ports on the circuit pack specified by cabinet, carrier, and slot.
carrier c	Displays all circuit packs and assigned ports on a specified carrier.
control	Displays all circuit packs in the control complex.
dsl	Displays all the DS1 (TN722, TN767, and TN464) port circuit packs administered and/or physically inserted.
port-network pn#	Displays all circuit packs located in a specified port network. (The list cabinet command gives the port network number(s) associated with a particular cabinet.) Circuit packs on switch node carriers are not displayed when the port-network qualifier is entered. To display switch node circuit packs, use the all , carrier or board qualifiers.
stations	Displays all circuit packs that can be assigned stations, including DS1 circuit packs for remote stations.
trunks	Displays all circuit packs that can be used for administering trunks.

Output

The following display shows the output from the **list configuration all** command.

```
list configuration all                                     Page 1

Field descriptions

Board Number	The functional name of the circuit pack
Code	The TN or UN code and suffix of the circuit packs
Vintage	The vintage number of the circuit pack
no board	The circuit pack is administered but not physically installed
conflict	The circuit pack administered to the slot differs from the circuit pack that is physically installed
no link	The T1 link is down to a DS1 circuit pack

The following display shows output from the **list configuration ds1** command.

```
list configuration ds1

                SYSTEM CONFIGURATION - DS1 Circuit Packs

Location      Code      Vintage      Signaling      Name      CSU MOD

01C18         TN464F    000002      isdn-pri      none
```

Field descriptions

Signaling	Displays only when list configuration ds1 is entered. The contents of the field are the same as the signaling mode administered for the ds1 circuit pack or <i>none</i> if the circuit pack is not administered.
Name	Displays only when list configuration ds1 is entered. The contents of the field are the same as the signaling mode administered for the ds1 circuit pack or <i>none</i> if the circuit pack is not administered.
CSU MOD	Displays only when list configuration ds1 option is selected. The field contains the identification number of the Integrated CSU module present on the DS1 circuit pack (TN767E or later / TN464F or later) or <i>none</i> . If the circuit pack is a TN464E or TN767D, <i>unknown</i> displays. If the circuit pack is a TN464D or TN767C or earlier suffix DS1 board, then <i>n/a</i> displays.

list config software-version

This command displays

- Software version numbers and compatibility indexes of the software load modules stored in system memory (RAM) and on the MSS devices (tape).
- The dates and times when translation and announcement data were last saved to the MSS.
- Information about any software update files that have been applied to the system. See “Software Upgrade” in [Chapter 5, “Routine Maintenance Procedures”](#) for an explanation of software versions and compatibility indexes.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list configuration software-version	<i>memory-resident / long</i> ¹	Data for the active SPE or both SPEs (High or Critical reliability systems) ²	init inads craft	none	none
	<i>print</i>	Report sent to printer.			
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ³ RAM-resident files only. Fields for tape data contain n/a			

1 On high and critical reliability systems, only fields for the active SPE are displayed unless the long option is specified.

2 Fields in the SPE-B column are blank for standard reliability systems.

3 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

If the tape or memory card contains a core dump file, fields for tape or memory card data display `coredump`. When a core dump is present, all other files on the device are marked invalid.

If the memory card cannot be read at the time the command is entered, the relevant fields display `no tape or memory card`. (This does not indicate that the system does not recognize the presence of the device.)

The following display shows the output from the **list configuration software-version** command.

```
list configuration software-version                               Page 1

Field descriptions, Page 1

Update File Section Displays information pertaining to software field-update files or "patches."

Creation (GMT) Tape and (GMT) Disk When the update file was originally created, in Greenwich Mean Time (GMT). Note that this is *not* the time at which the update file was written to the MSS device.

Old-Version Tape and Disk The software version for which the update was created.

Old-Identifier Tape and Disk Which previous update file this update file expected to find stored in the MSS when it was applied.

New-Identifier Tape and Disk Uniquely identifies the current update file.

Software Version Section Displays information related to the current software-load module stored in memory and in the MSS.

Memory Resident Version number of the RAM-resident load module.

Mem Card Resident Version of memory card resident load module. If a memory card is not installed, this field will display "no card".

Update-identifier (Patch Identifier) This uniquely identifies the update file, if any, that has been applied to memory.

Update-state (Patch State) The status of the software field-update ("patch") file id is displayed.

Translation Date Section Displays information related to the translation files as stored in memory and the MSS.

Memory Resident Date and time when translation data was last read from the MSS into memory. This is stored in SPE memory and is not modified by changes to translation data. A **save translation** command updates this date. If *Date invalid* is displayed, the timestamp does not contain the expected information.

Mem Card Resident The date and time when translation data was last saved to the memory card. If a memory card is not installed, this field will display *no card*.

```

Field descriptions, Page 2

P1 FW Version Section Displays information related to the Processor Interface (PI) circuit pack (resident copy and corresponding tape file) firmware.

PI 1 Resident The version of firmware in the first PI circuit pack in the control carrier.

PI 2 Resident The version of firmware in the second PI circuit pack in the control carrier.

Flash Resident The version of PI firmware residing on the system flash memory.

Announcement Date Section Displays information related to the announcement files. Information is displayed for the memory resident copy as well as the corresponding MSS file

Mem Card Resident The last date and time that announcement data was saved to the memory card. If the memory card is not installed, this field displays *no card*.

**PKT-CTRL FW
Version Section** displays information related to the Packet Control firmware. Information is displayed for the Packet Control circuit pack resident copy as well as the corresponding tape file

Pkt-ctrl Resident The version of firmware in the Packet Control circuit pack.

Flash Resident The version of the Packet Control circuit pack residing on the system flash memory.

Some things to note when using the **list configuration software-version** command are:

1. For simplex systems, the fields under column "SPE_B are always blank and the optional **Long** qualifier is not part of the command line.
2. For a High or Critical Reliability System, the fields under the column of the standby SPE are blank if the optional **long** modifier is not given.
3. If the tape or memory card contains a core dump file system, fields for the tape or memory card will contain **coredump**. This is because in a coredump file system all files other than the **coredump** file are marked as invalid.
4. If for any reason, MSS cannot be read when the command is issued, the string **no tape** or **none** for no memory card will be placed in the appropriate fields on the screen. This does not mean that the system thinks there is no tape, only that the software was unable to read the appropriate information when requested.
5. If the command is issued using the **memory-resident** option, the fields on the form associated with the tape will contain the string **n/a**.
6. When the status of the update field is displayed, the following strings will be used (for more information refer to step c of this list):
 - a. *none in memory* — no update has been applied to memory.
 - b. *immediate partially applied* — an error condition that is valid only when an update that is in the process of being applied fails. Check the validity of the update file that was sent, and then check the hardware error log for tape errors, and follow standard maintenance procedures.
 - c. *all immediate applied deferred pending* — a valid update file was received by the switch, and all the immediate sub-patches were applied. This state indicates that there are deferred sub-patches in the update file, and a system reset of the proper level has not occurred since the update file was received.

- d. *deferred partially applied* — an error condition that is valid only when a update that is in the process of being applied fails. Check the validity of the update file that was sent, and then check the hardware error log for tape errors, and follow standard maintenance procedures.
- e. *entirely applied to memory* — the update associated with the memory-resident identifier has been completely applied to memory.

list disabled-mos

This command displays all the MOs that have been maintenance disabled in the system.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list disabled-mos	<i>print</i>	Report sent to printer.	init inads	none	none
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list disabled-MOs list disabled-MOs print list disabled-MOs schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

```
list disabled-MOs

      DISABLED MAINTENANCE OBJECT INFORMATION

Maintenance Name  Location  Status
ALL              Enabled
DIG-LINE         02A1203 Disabled

Command successfully completed
```

Field descriptions

Maintenance Name	The type of maintenance object (or group of maintenance objects) that have been disabled. All is also valid.
Location	The physical location of the disabled maintenance object that has been disabled. This field displays blanks if all maintenance objects have been disabled (disable all) or all MOs of a specific type have been disabled (disable MO-all).
Status	Whether the maintenance object or group of maintenance objects is Enabled or Disabled.

list history

The list history command generates a log listing of the most recently completed "data affecting" administration and maintenance commands. Data commands are those administration and maintenance commands that change the data state associated with any object and qualifier in the system. Administration data commands affect translation data, while maintenance data commands affect state information. For example, **change station** is a data command, whereas **display station** is not.

All information in the transaction log is saved as translation data when the **save translation** command is performed (LIFO order). When the switch COLD I starts or reboots, the saved translation, and thus the transaction log, is loaded. This way, the translation data and the data in the transaction log remain compatible.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list history	<i>print</i>	Report sent to printer.	init inads craft cust browse nms	none	See below
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list history list history print list history schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The translation log is written to the memory card as translation data when the **save translation** command is executed. The translation data is time stamped when saved. This time stamp is noted when translation is loaded from the memory card and included in all recent change history reports.

When a user requests a recent change history report, there could be other users concurrently issuing data commands and altering the contents of the transaction log. Therefore, if the user pages the entire way through the report, the oldest entries in the transaction log (maximum 250 commands) may have been overwritten by data commands issued by these other users. Should this occur, the final entries of the report show the data commands issued by the other users since the recent change history report was originally requested.

Also, use of the **set time** command to alter the system clock could make it look as if the recent change history report is not in true LIFO order.

Output

```
list history                               Page 1   SPE A

Field descriptions

Date The date the command was issued (mm/dd)
Time The time the command was issued (hh:mm)
Port The port type to which the user was connected when the command was issued.

Port Number	Board	List History Display
0 - 30	EPN Maintenance Board Port	MAINT
31 - 40	System Access Port	SYS-PORT
41	Maintenance Board Port	SYSAM-LCL
42	Remote Maintenance Board Port	SYSAM-RMT

Login User login
Actn The action part of the command, specifying the operation to be performed. This field is truncated after 4 characters to allow enough space for objects and qualifiers and to uniquely identify each action.
Object The qualifier (12 characters) specifying the object of the command. Where the object is multiple words in length, only the first word is displayed in the object field; all succeeding words are treated as qualifiers.
Qualifier One or more qualifiers describing the characteristics of the action/object pair. This field is truncated after 31 characters to keep information for a command on a single line.

list ip-route

This command displays a list of the IP route from DEFINITY ECS out to the LAN. You can enter the "board" parameter and specify which C-LAN's circuit pack to show the IP routes for that circuit pack (for example, **list ip-route board UUCss**).

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list ip-route	<i>n</i> <i>board</i> <i>UUCss</i>	Route number Location Example: list ip-route board 01A03	init inads craft	none	none

Output

The following example shows the output from the **list ip-route n** command.

```
list ip-route 1 Page 1 of 1
                IP ROUTING

Route   Destination
Number  Node
Gateway
C-LAN   Board   Metric   Accepted
by C-LAN?

xxx     xxxxxxxxxxxxxxxxxxxx  xxxxxxxxxxxxxxxxxxxx  xxxxxx  x      x
xxx     xxxxxxxxxxxxxxxxxxxx  xxxxxxxxxxxxxxxxxxxx  xxxxxx  x      x
xxx     xxxxxxxxxxxxxxxxxxxx  xxxxxxxxxxxxxxxxxxxx  xxxxxx  x      x
```

Field descriptions

Route Number	IP-route number
Destination Node	Destination of the route. The destination is a name administered on the Node Name form that can include the keyword DEFAULT indicating the default route. Default is blank.
Gateway	The node name of the Gateway through which the destination is to be reached. The Gateway is a name administered on the Node Name form. Default is blank.
C-LAN Board	Indicates the giving circuit pack location for the circuit pack that provides the interface for the route. Default is blank.
Metric	Specifies the hop count metric which gives an indication of how many hops are involved on this route in order to reach the destination from the given C-LAN circuit pack. Valid entry is 0 (a simple route), 1 (a complex route), or blank (default).
Accepted by CLAN	Indicates whether a C-LAN circuit pack has accepted the administered IP-route. This is initialized to no by the system when a new route is administered and then set to yes after the C-LAN has accepted the given routing information and is displayed as an "x."

list isdn-testcall

This command displays the ISDN-PRI trunks in use for ISDN-PRI test calls. This command is useful to determine which trunk is in use for an outgoing ISDN-PRI test call.

8 Maintenance Commands and Trouble-Clearing Aids
list marked-ports

8-126

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list isdn-testcall	print	Report sent to printer.	init inads craft	none	none
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list isdn-testcall list isdn-testcall print list isdn-testcall schedule			

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

```
list isdn-testcall

                ISDN-PRI TESTCALLS
B-Channel  Start Time  Duration  M/T Port
078/001    25/12:36    120      1B1102

Command successfully completed
```

Field descriptions

- B-Channel** The trunk in use for the ISDN-PRI test call (trunk group number/member number).
- Start Time** The time the test call started (dd/hh:mm format).
- Duration** The expected duration of the test call.
- M/T Port** The TN771 Maintenance/Test circuit pack's digital port address (in cabinet/carrier/slot/circuit format) in use for the outgoing asynchronous ISDN-PRI test call.

list marked-ports

This command lists all the ports that have been marked unusable with the **mark port** command (maximum of fifteen marked ports per page).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list marked-ports	print	Report sent to printer.	init	none	none
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list marked-ports list marked-ports print list marked-ports schedule	inads craft cust rcust bcms browse		

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

```
list marked-ports

          MARKED-PORT INFORMATION
Port      Board-Type
1C0101    DIG-BD
1C0601
1C0702    DIG-BD

Command successfully completed
```

Field descriptions

- Port** The port address (cabinet-carrier-slot-circuit) of the marked port.
- Board-Type** The type of circuit pack containing the marked port. If this circuit pack information is no longer available because the circuit pack was removed after the port was marked, the `Board-Type` field is blank.

list measurements

This command lists performance measurements of a DS-1 link indicating the quality of the DS-1 physical interface between the system and a far end system. The **ds1 summary** option provides a summary report while the **ds1 log** option provides a detailed report.

NOTE:

The **list measurements** command has many more options than documented here. Only those options dealing with DS1 board are documented below.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list measurements	<i>log</i>	Detailed report generated	init	none	none
	<i>summary</i>	Summary report generated	inads		
	<i>ds1_location</i>	The physical location of a DS1 circuit pack entered as cabinet-carrier-slot.	craft		
	<i>print</i>	Report sent to printer.	cust		
	<i>schedule</i>	Report sent to printer. Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list measurements ds1 log 2a18 list measurements ds1 summary 2a18 print list measurements ds1 summary 2a18 schedule	rcust browse nms bcms		

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

```
list measurements ds1 summary 2a19                               SPE A

Command successfully completed
```

Field descriptions (list measurements ds1-summary)

Counted Since: The start time and date when the associated measurement counters were cleared or the DS1 circuit pack was administered.

Number of Seconds Elapsed Into Current 15-min Interval: The number of seconds from the beginning of the current 15-minute interval (0 - 900).

Total of Valid 15-min Intervals in Past 24-hr Period: The total number of 15-minute intervals in the past 24-hour period that contain valid data (0 - 96).

Category The four categories correspond to four measurement error counters. The four categories are "E", "B", "S", and "F". The meanings of each category follow:

- **Errored Seconds:** the value of the errored seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).
- **Bursty Err Secs:** the value of the bursty errored seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).
- **Severely Err Secs:** the value of the severely errored seconds counter for the specified 15-minute interval(0 - 900 or N/A if data for the 15-minute interval is invalid).
- **Failed Seconds:** the value of the failed seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).

Worst_15-Min_Interval The date(Date), end time(Time), and error count (Count; from 0 to 900 in increments of four) of the 15-minute interval in the previous 24-hour period that contains the maximum value for each of the four error categories.

Total of 24-Hour Count The sum of all valid 15-minute counts for the previous 24-hour period for each of the four error categories (0 - 65535).

Current 15-Minute Interval The error count for the current (incomplete) 15-minute interval for each of the four error categories (0 - 900 or N/A if data for the 15-minute interval is invalid).

```
list measurements dsl log 2a19                               SPE A

Field descriptions (list measurements ds1 log)

Counted Since:	The start time and date when the associated measurement counters were cleared or the DS1 circuit pack was administered.
DATE	The date of the 15-minute interval.
TIME	The time of the 15-minute interval.
ERRORED SECONDS	The value of the errored seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).
BURSTY ERR SECS	The value of the bursty errored seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).
SEVERELY ERR SECS	The value of the severely errored seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).
FAILED SECONDS	The value of the failed seconds counter for the specified 15-minute interval (0 - 900 or N/A if data for the 15-minute interval is invalid).
VALID INTERVAL	<p>This field indicates whether the data for the specified 15-minute interval is valid. Data is considered valid when a count for that 15-minute interval. If the field has a value of y, the data for the four error categories is valid; otherwise, the data is invalid.</p> <p>Data is considered valid when a count for that 15-minute interval is retrieved and none of the following invalid conditions occur:</p> <ul style="list-style-type: none">— If a system warm start or a system cold start occurred during the interval— If the DS1 circuit pack was not inserted during the interval— If the system time was changed during the interval— If the system was too busy to respond to a poll request for the interval.

list mst

This command displays the messages in the trace buffer and can be used when the trace is disabled or active, but if active, older messages may be sporadically omitted if wraparound is selected and the message rate is high. The command can be used repeatedly without destroying the integrity of the buffer.

8 Maintenance Commands and Trouble-Clearing Aids
list mst

8-132

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list mst	<i>from message number</i>	Message number to start the display; if the number is not in the buffer, then that is indicated on the display, and no additional messages are displayed. Omitting this qualifier causes messages to be displayed starting with the oldest FIFO and continuous messages.	init inads	FIFO order	See documentation on the system printer feature.
	<i>count number</i>	Message count; can be used to limit the trace			
	<i>continuous</i>	Display updates as new messages enter the trace buffer (FIFO). This option is most useful in conjunction with "auto-page." The command terminates only when canceled by the user.			
	<i>LIFO</i>	Newest message displayed first.			
	<i>FIFO</i>	Messages displayed in the order received.			
	<i>[auto-page]</i>	The screen will automatically page when full. Used in combination with <i>continuous</i> (above), provides a way to "watch" as messages arrive.			
	<i>print</i> <i>schedule</i>	Report sent to printer. Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list mst continuous list mst continuous auto-page list mst LIFO list mst from 222 count 7			

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

```
list mst

0xD3	X.25 Link status message
0xE2	X.25 Session Timer Expirations
0xF0	X.25 Error Message (Outgoing Message Lost)
0xF1	X.25 Unrecognized Messages
0xF2	X.25 Error Message (DIP ICOM Record Aborted) (R2 Only)
0xF9	Snapper instrumentation message
0xFA	Snapper continuation message (for large msgs)

Detailed description of Messages**

Note that the X.25 messages discussed below really follow the BX.25 Message Protocol.

The terminology Message[n] used below refers to the byte at offset n in the message being displayed.

MST message types contain a version number. Whenever the structure of the MST message changes, the version field in the MST buffer is changed. Version 1 (default) displays a blank in the version field which is immediately after the MST message type field. Subsequent versions display the version number after the MST message type field and are connected with a hyphen ("-"). For example: Version 2 of the X.25 Application error/notification message has added the text of the pm state table stimulus which was ignored.

Version 1 of MST message type 0xA2 would appear on the 'list mst' output:

Number	Date/Time	Type	Message
1	11:41:22:425	A2	17 10

Version 2 of MST message type 0xA2 would appear on the list mst output:

Number	Date/Time	Type	Message
90	12:41:14:112	A2-02	17 10 21 03 32 05 01 80

Vector Trace

Message type: 0x10

Message format:

- Message[1-4] = call identifier (CID) (defined in \$BASEPJ/hdrs/capro.h)
- Message[5-6] = vector number (defined in \$BASEPJ/hdrs/dpm_calls.h)
- Message[7] = step number (defined in \$BASEPJ/hdrs/callr.h)
- Message[8] = step type (defined in \$BASEPJ/hdrs/dpm_calls.h)
- Message[9] = step state (defined in \$BASEPJ/hdrs/dpm_calls.h)
- Message[10-12] = VDN
- Message[13] = port network number
- Message[14] = endpoint number
- Message[15] = angel number
- Message[16] = circuit number
- Message[17-20] = trunk number
- Message[21+] = auxiliary data (based on step type)

Vector Event Trace (D92 Only)

Message type:

0x11

Message format:

- Message[1-4] = cid (defined in \$BASEPJ/hdrs/capro.h)
- Message[5-6] = event
- Message[7+] = auxiliary data (based on event)

Events are defined in \$BASEPJ/hdrs/evnt_defs.h. Events based on the call_p will have the following auxiliary data:

- Message[7-8] = vector number
- Message[9-10] = step number

Events based on the grp_m will have the following auxiliary data:

- Message[7-10] = hunt group number

IMT (D92)

The messages described in this section cannot be controlled directly through any of the MST screens. They are enabled/disabled through TCM but their output goes to the MST buffer. See [IMT] for details on these messages.

A read-only field in the "change mst" screen, "Other Tracing?", alerts the user that one or more of these types of messages is enabled.

0x21 - IMT proc_errs

Message format:

- Message[1-4] = process number(lname)
- Message[5-8] = sequence number (defined in *.p/hdrs/main_err.h, for example: \$BASEPJ/gmtce.ss/hmm.p/hdrs/main_err.h)
- Message[9-12] = data 1
- Message[13-17] = data 2

0x22 - IMT crec

Message format:

- Message[1+] = call record (defined as CALLR typedef in \$BASEPJ/hdrs/callr.h)

0x23 - MT_IMT (miscellaneous IMT hooks)

This message type is for miscellaneous IMT hooks. The only sub-type currently available is for a debug button (dbut). The button number is provided in the debug button MST message so that more than one button can be administered (through IMT) to convey different meanings. For example, depression of button N could signify the start of the problem symptoms, while depression of button N + X could signify the end of the problem symptoms. Note that the button number being logged represents the position of a button on a particular set type, and will be different depending on set type and module type (feature, coverage, display, ...), etc. The mapping of the button number stored in the IMT_BUT_DEBUG MST message to a position on the set is not trivial, however, the debug buttons can be administered through TCM, debug button filtering enabled through TCM and MST enabled using the 'enable mst' command and the resultant messages sent to MST when each button is depressed can be examined for the button data and noted.

Message format:

Message[1] = 0x01 (debug button sub-type, IMT_BUT_DEBUG)
Message[2-3] = button number
Message[4-7] = user id

0x40 - internal message tracing of call_p, conn_m, grp_m, serv_d, suser_m

Message formats: conn_m, grp_m, and suser_m:

Message[1-4] = user identifier
Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
Message[7+] = standard message (depends on hook type)

serv_d (map-type messages):

Message[1-4] = user identifier
Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
Message[7] = STIM type
Message[8-11] = service identifier
Message[12] = port network number
Message[13] = endpoint number
Message[14] = angel number
Message[15] = circuit number
Message[16+] = message

serv_d (other serv_d messages):

- Message[1-4] = user identifier
- Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
- Message[7] = STIM type
- Message[8-11] = service identifier
- Message[12-13] = interpreted STIM
- Message[14-17] = aux data 0
- Message[18-21] = aux data 1
- Message[22-25] = aux data 2
- Message[26-29] = aux data 3
- Message[30] = hwtype field
- Message[31] = hwdata field

call_p:

- Message[1-4] = call identifier
- Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
- Message[7] = supervisor
- Message[8] = digit prep
- Message[9+] = message

CCMS

Message types:

0x30 uplink
0x31 downlink

Message format:

- Message[1] = port network number
- Message[2] = endpoint number
- Message[3] = angel number
- Message[4] = circuit number
- Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)

- Message[7] = message length
- Message[8] = angel id
- Message[9+] = standard CCMS message

Packet (D92)

Message type:

0x32 uplink

Message format:

- Message[1-4] = user identifier
- Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
- Message[7-10] = link identifier
- Message[11-12] = message type (defined in \$BASEPJ/hdrs/pcd_calls.h)
- Message[13+] = standard packet message

Message type:

0x33 downlink

Message format:

- Message[1] = port network number
- Message[2] = endpoint number
- Message[3] = angel number
- Message[4] = circuit number
- Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
- Message[7-10] = link identifier
- Message[11+] = standard packet message

ASAI

ASAI messages listed on the MST screen consist of a 4 octet header and a variable length body. The header contains the ASAI port address encoded with 8 hexadecimal digits. This same encoding is also used for BRI and PRI.

In message types other than 50 and 51 (Level 2 Primitives), following the port address is a one octet field called the qualifier. The meaning of the qualifier varies according to the type (as specified by the MST encode) of ASAI message

traced. The body which is a real ASAI message (except for Level 2 Primitives) follows the qualifier.

When the display is administered for abbreviated format, the body contains only the initial part of the ASAI message (all information in beginning of message up to and including the Q.931 IE tag) plus the cause IE (if present).

0x50 - ASAI level 2 uplink primitive

Message[1] = Port Network Number of ASAI port

Message[2] = GAP count (since last clear - high byte)

Message[3] = GAP count (since last clear - low byte)

GAP reasons:

0x01 - disabled, disable mst command executed

0x02 - disabled, mst timer expired

0x03 - disabled, buffer full on no-wrap

0x04 - disabled, restart occurred

0x05 - disabled, by stop trigger or count

0x06 - disabled, audit error

0x07 - not disabled, stopped by stop trigger or count

0x72 - Time changed while trace enabled

Message[1] = 0x00

Message[2] = timestamp indication

timestamp indication:

0x00 - MST timestamp is old time

0x01 - MST timestamp is new time

X.25 Application Data

The processor channel number is the R1/R3 term, and R2 calls it the port number. The processor channel number is equal to the Application port number in R1. In R3, the processor channel admin screen should be inspected to determine the mapping.

0xA0 - X.25 outgoing application message

Message[1] = processor channel number

Message[2] = sequence number

Message[3] = buffer id

Message[4] = 0x00

Message[5+] = application message¹

¹ Application messages will contain the session layer data headers and the data.

In abbreviated mode, the application message is not saved.

0xA1 - X.25 incoming application message

Message[1] = processor channel number

Message[2] = sequence number

Message[3+] = application message

In abbreviated mode, the application message is not saved.

Application Control

0xA2 - X.25 application error or notification

NOTE:

The 'X.25 application error message' category contains notifications as well as errors.

0xA2, 0xF0 and 0xF2 messages will be turned on by responding 'y' to the 'Application Errors?' field.

Version 1:

Message[1] = processor channel number

Message[2] = application error/notification

Version 2:

Message[1] = processor channel number

Message[2] = application error/notification

Message[3+] = pm stimulus ignored (For message[2] == 0x10 only)

Errors/Notifications:

R1/R3:

- 0x01 - no outgoing buffer available
- 0x05 - pvc session down
- 0x06 - pvc session up
- 0x07 - pvc session connect
- 0x08 - pvc session restart
- 0x09 - message buffer overload uplink
- 0x0A - message buffer overload downlink
- 0x0B - message buffer exhaustion
- 0x0C - max # of outgoing msgs allowed
- 0x0D - bad msg type in message buffer routine
- 0x0E - no message buffers available
- 0x0F - message buffer pointer error
- 0x10 - pm state table stimulus ignored
- 0x11 - bad session connect message

Session Layer Control

NOTE:

The session layer header is considered part of the session layer message.

PRI_ALLOC 0x07 /* pri port allocated but not yet used */
PRI_CONN 0x08 /* pri port connected */
HIGH_STATE 0x08 /* Highest value a port state can be*/

X.25 Errors

0xF0 - X.25 Error Message (Outgoing Message Lost)

Note that 0xA2, 0xF0 and 0xF2 messages will be turned on by responding 'y' to the 'Application Errors?' field.

Version 1:

Message[1] = processor channel number
Message[2] = sequence number
Message[3+] = message

Version 2:

Message[1] = processor channel number
Message[2] = sequence number
Message[3] = reason code
Message[4+] = message

Reason Codes:

0x00 /* message lost */
/* 1 reserved */
0x02 /* message ignored, sequence number is within window but less
* than expected
*/
0x03 /* message ignored, bad sequence number */
0x04 /* message ignored, other port has sent a disconnect message */
0x05 /* message ignored, send request is rejected*/
0x06 /* message ignored, from ig_l3 */

8 Maintenance Commands and Trouble-Clearing Aids
list suspend-alm-orig

8-163

```
0x07 /* message ignored, from l3_err */  
0x08 /* sequence number is within window but less  
    * than expected (resync)  
    */  
0x09 /* bad sequence number (resync) */
```

In abbreviated mode, the application message is not saved.

0xF1 - Unrecognized X.25 Messages

Message[1] = processor channel number
Message[2] = Failure type
Message[3+] = session message

Failure types:

0x00 - Reserved
0x01 - Unknown session layer message type
0x02 - unrecognized control message

0xF2 - BX.25 Error Message (DIP ICOM Record Aborted)

R2 only

list suspend-alm-orig

This command lists active entries in the Suspend Alarm Origination table. Even though this command only lists active entries, an entry that expires during the list process still appears in the output. If the Suspend Alarm Origination table is empty, the output contain only the title and field headings.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
list suspend-alm-orig	<i>print</i>	Report sent to printer.	init	none	none
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: list suspend-alm-orig list suspend-alm-orig print list suspend-alm-orig schedule	inads craft		

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

```
list suspend-alm-orig
```

```
        Suspend Alarm Origination Entries
```

```
Physical   Board      Expires At
01C03     off-only   06/11/15:06
01E0407   on-and-off 06/11/17:26
01E0406   on-and-off 06/12/45:34
```

list testcalls

This command generates an Automatic Transmission Measurement System (ATMS) report. The ATMS allows the voice and data trunk facilities to be measured for satisfactory transmission performance. The performance of the trunks is evaluated according to measurements produced by a series of analog tests and are compared against user-defined threshold values. The purpose of the report is to provide measurement data to help determine the quality of trunk lines. The measurement report contains data on trunk signal loss, noise, singing return loss, and echo return loss.

The measurements are produced by a set of analog trunk tests. The tests are initiated by a maintenance demand test or by a set of scheduled tests. The largest portion of these measurements are generated through scheduled testing during system quiet hours (hours where the traffic volume is low). Each trunk test

performed by the system stores the results in a database. The trunk measurements in this database reflect the state of each trunk at the time of its last test.

Action/Object	Qualifiers/Options	Qualifier/Option Description
list testcalls	<i>detail</i>	Detailed measurement report displayed
	<i>summary</i>	Summary measurement report displayed
	<i>grp group number</i>	Measurements for a specific trunk group displayed. When used with the to-grp option, this option is the starting trunk group in a range of user-specified trunk groups.
	<i>to-grp group number</i>	Measurements for all trunk groups from 1 to the specified "to-grp" trunk group are displayed. When used with the grp option, this option is the ending trunk group in a range of user-specified trunk groups.
	<i>mem member number</i>	Measurements for a specific trunk group member displayed. When used with the to-mem option, this option is the starting trunk group member in a range of user-specified trunk group members.
	<i>to-mem member number</i>	Measurements for all trunk group members from 1 to the specified "to-mem" trunk group member displayed. When used with the mem option, this option is the ending trunk group member in a range of user-specified trunk group members.
	<i>port location</i>	Measurements for a specific trunk circuit (port) displayed
	<i>result result identifier</i>	This option is used to filter out all measurement results that do not match the user-specified result, that is, only measurement results that match the user specified result are displayed. Examples of results are pass, marg, fail, etc.
	<i>not-result result identifier</i>	This option is used to filter out all measurement results that do match the user-specified result, that is, only measurement results that do not match the user specified result are displayed. Examples of results are pass, marg, fail, etc.
	<i>count count number</i>	This option is used to specify (limit) the number of records displayed.
	<i>print</i>	Report sent to printer
<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹	

1 Refer to the Report Scheduler and System Printer feature specification for more details.

Examples

```
list testcalls detail
list testcalls detail print
list testcalls detail grp 78
list testcalls detail grp 78 result marg count 3 schedule
list testcalls detail grp 78 to-grp 80
list testcalls detail grp 78 to-grp 80 mem 1 print
```

```
list testcalls detail grp 78 to-grp 80 mem 1 not-result pass
list testcalls detail grp 78 to-grp 80 mem 1 count 2 schedule
list testcalls detail grp 78 to-grp 80 mem 1 to-mem 5
list testcalls detail grp 78 to-grp 80 mem 1 to-mem 5 count 3 print
list testcalls detail grp 78 to-grp 80 mem 1 to-mem 5 count 3 result pass
list testcalls detail mem 1 count 3 result pass
list testcalls detail to-grp 78 to-mem 4 count 3 result pass
list testcalls detail to-mem 3 result pass
list testcalls detail port 1c1504
list testcalls detail port 1c1504 count 5 schedule
list testcalls detail port 1c1504 count 5 not-result marg print
list testcalls summary
list testcalls summary grp 78
list testcalls summary grp 78 print
list testcalls summary grp 78 count 5
list testcalls summary grp 78 count 5 schedule
list testcalls summary grp 78 to-grp 80
list testcalls summary grp 78 to-grp 80 count 3
list testcalls summary to-grp 78
list testcalls summary to-grp 78 count 7 schedule
```

Output

The following example is of the output for the **list testcalls detail grp 80** command.

```
list testcalls detail grp 80                               Page 1   SPE A

Detail report field descriptions

Group	The trunk group number selected.
Type	The trunk group type.
Vendor	The vendor of this trunk group.
TTL Type	The kind of test line for this trunk group.
Threshold Values	<p>The list of marginal and unacceptable threshold values defined on the trunk group form.</p> <p>The following fields appear on the lower section of the form. Many of the column headings contain the abbreviations "FE" for far end and "NE" for near end. These abbreviations define which end took the measurements.</p>
Trk Mem	The trunk member within the trunk group.
Test Date	The month and day this trunk was tested.
Test Time	The time of day this trunk was tested.
Tst Rslt	This field describes the results of the trunk transmission test.
1004Hz-loss Min	Far-to-near and near-to-far measurements of 1004-Hz loss from low-level tone.
1004Hz-loss Max	Far-to-near and near-to-far measurements of 1004-Hz loss at 0 dBm.
Loss dev at 404Hz	Transmission tests at low frequency. These tests measure a maximum positive and negative deviation of +9 and -9 dB from the 1004-Hz loss measurements.
Loss dev at 2804Hz	Transmission tests at high frequency. These tests measure a maximum positive and negative deviation of +9 and -9 dB from the 1004-Hz loss measurements.
C-msg Noise	Maximum noise interference (in dBmC: decibels above reference noise, which is B(EQ)10 sup -12E(EQ) watts) terminating on a voice terminal within the voice-band frequency range (500 to 2500 Hz) between 15 and 55 dBmC.
C-ntch Noise	Maximum signal-dependent noise interference on a line between 34 and 74 dBmC.
SRL-LO	Singing return loss from 0 to 40 dB between the sum of the circuit (repeater) gains and the sum of the circuit losses. SRL-LO occurs most often in the frequency range of 200 to 500 Hz.
SRL-HI	Singing return loss from 0 to 40 dB between the sum of the circuit (repeater) gains on a circuit and the sum of the circuit losses. SRL-HI occurs most often in the frequency range of 2500 to 3200 Hz.

ERL

Echo return loss from 0 to 40 dB between the level of signal strength transmitted and the level of signal strength reflected. ERL occurs most often in the frequency range of 500 to 2500 Hz.

The following example is the output from the **list testcalls summary grp 80** command.

```
list testcalls summary grp 80                               SPE A

                ATMS MEASUREMENT SUMMARY REPORT

```

Summary report field descriptions

Trk Grp Num	The trunk group number which is being summarized. Only outgoing or two-way analog trunks will be listed.
Num Of Trks	The total number of members per trunk group.
Last Test Date	The date of the oldest measurement in the trunk group.
Last Test Time	The time of the oldest measurement in the trunk group.
Trunks Passed Transm Test	The number of trunks that have passed the trunk transmission tests.
Trunks Failed Marginal Threshld	The number of trunks that failed a marginal threshold, but not an unacceptable threshold according to the threshold values defined on the trunk group form.
Trunks Failed Unaccept Threshld	This is taken from the unacceptable threshold administered on the Trunk group form.
Trks In-Use	The number of trunks that were in-use at the time of testing.
Trks Not Test	The number of trunks that were not tested due to error conditions.
Busied Out Trunks	The number of trunks that were busied out at the time. This could be due to hardware problems, incorrect threshold values, etc.

mark port

The **mark port** command marks faulty ports as defective to prevent their use in other administrative operations (for example, adding a data-module or station). Ports on any type of circuit pack may be marked except for installed circuit packs that are administered automatically (for example, Tone Detector, Tone Generator, Announcement, Speech Synthesizer, Call Classifier and Maintenance/Test circuit packs). If the port can be administered manually, and it is unassigned, the port is marked as faulty. The **clear port** command reactivates the port. The **list marked-ports command** displays marked ports in a list format. All marked port information is saved as part of translations.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
mark port	<i>location</i>	Physical location: PCSSpp Examples: mark port 1c0208 mark port 2a1001	init inads craft	none	none

monitor bcms

The **monitor bcms** command displays output for agents and splits and summarizes the bcms condition. This on-line status report automatically updates every 30 seconds (or by pressing the Update key) until the command is canceled by pressing the Cancel key. Three display options are available: skill, split, and system.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
monitor bcms	<i>split</i> <i>split number</i> <i>system</i> <i>system number</i> <i>skill</i> <i>skill number</i>	see below	init inads craft cust rcust bcms browse	none	none

Qualifier Description

split Specifies that the command display status information for a specified split number (an ACD hunt group).

split number The split's identity to the switch and BCMS; an ACD hunt group number (split number). This parameter is entered only when the "split" parameter is entered.

system This specifies that the command display split queue status as well as cumulative split information for all the BCMS measured splits.

- system number** ACD hunt group numbers (split numbers) separated by spaces and/or split number ranges separated by a hyphen ("-").
- skill** This specifies that the command display status information for a specified skill number.
- skill number** The skill's identity to the switch and BCMS; an ACD hunt group number (skill number). This parameter is entered only when the "skill" parameter is entered.

Output

The following examples shows the output from the **monitor bcms system** command.

```

monitor bcms system                               Page 1 of 1

                BCMS SYSTEM STATUS

                Date: 14:02 THU OCT 17 1991

                AVG                AVG
                CALLS OLDEST  ANSW AVAIL  #      ABAND #      AVG      AVG
                WAIT  CALL  SPEED AGENT ABAND TIME ACD  TALK  AFTER
Service      3    1:03    :45   0     3     :30  20   2:30  1:25
Sales        5     :33    :15   0    11     :45  36   1:32  :35
    
```

Field descriptions

- Date:** The current date and time which is updated every 30 seconds or when the UPDATE key is pressed.
- SPLIT** The name of the split being reported, if no name is administered then the split extension is displayed in the form "EXTxxxxx". Splits are displayed in split number order. This field is translation data.
- CALLS WAIT** The number of calls currently waiting in this split's queue. If any of these calls are Direct Agent Calls, the field is preceded by an asterisk. This field is real-time status data.
- OLDEST CALL** The amount of time that the oldest call has waited in queue. This field is real-time status data.

AVG ANSW SPEED	The average speed of answer for this split during the current period. This includes time in queue and time ringing at the agent's voice terminal. Calls that intraflow (calls that overflow from one ACD split to another split) do not have queue time from previous splits included in the average. The calculation is Total Answer Time/Total Automatic Call Distribution (ACD) Calls. This field is measurement data and includes only those calls that have completed (terminated).
AVAIL AGENT	The number of agents in this split currently available to receive an Automatic Call Distribution (ACD) call from this split. This field is real-time status data.
# ABAND	The number of calls that have abandoned during the current period. This field is measurement data.
AVG ABAND TIME	The average time abandoned calls waited in queue before abandoning during the current period. The calculation is Total Abandon Time/Total Calls Abandoned. This field is measurement data and includes only those calls that have completed (terminated).
# ACD	The number of Automatic Call Distribution (ACD) calls handled by this split during the current period. This includes calls that intraflow into the split. This field is measurement data.
AVG TALK	The average talk time for Automatic Call Distribution (ACD) calls handled by this split during the current period. This does not include ring time at the agents' voice terminal. The calculation is Total ACD Talk Time/Number of ACD Calls. This field is measurement data and includes only those calls that have completed (terminated).
AVG AFTER CALL	The average After Call Work (ACW) time for Automatic Call Distribution (ACD) calls handled by this split during the current period. ACD calls with no ACW time are included in the average. Time spent on direct incoming or outgoing calls while in ACW are not included in the average. The calculation is (Total ACW Time - Total ACW Incoming Time - Total ACW Outgoing Time)/Total ACD Calls. This field is measurement data and includes only those calls that have completed (terminated).

The second example shows the output from the **monitor bcms split 1** command.

```
monitor bcms split 1                               Page 1 of 1   SPE A

          BCMS SPLIT (AGENT) STATUS

Split: 1
Split Name: hunt group 1           Date: 9:02 TUE OCT 22 1991
Calls Waiting: 0
Oldest Call: 0:00
0=Staffed  0=Avail  0=ACD  0=ACW  0=AUX  0=Extn  0=OtherSplit
AGENT      EXT     STATE   TIME    ACD  EXTN IN  EXTN OUT
          CALLS  CALLS   CALLS
```

Field descriptions

- Split:** The number of the split requested. This field is translation data.
- Split Name:** The name of the split requested. If no name exists the split extension is displayed in the form "EXT xxxxx". This field is translation data.
- Date:** The current date and time which is updated every 30 seconds or when the UPDATE key is pressed.
- Calls Waiting:** The number of calls currently waiting in this split's queue. If any of these calls are Direct Agent Calls, the field is preceded by an asterisk. This field is real-time status data.
- Oldest Call:** The time in minutes:seconds that the current oldest call has waited in this split's queue. This field is real-time status data.
- Staffed** The number of agents currently logged into this split. This field is real-time status data.
- Avail** The number of agents currently available to receive an Automatic Call Distribution (ACD) call in this split. Agents are in either the Auto-in or Manual-in work modes and are not currently on a call. If the agent is on another split's call or in After Call Work (ACW) for another split, this agent is not considered available and is not recorded here. This field is real-time status data.
- ACD** The number of agents in this split currently on an Automatic Call Distribution (ACD) call for this split. This includes ACD calls that are being handled by this split that arrive as coverage from another split. This field also includes outbound calls (Outgoing Call Manager) that are distributed through the ACD. Note that if an agent puts an ACD call on hold, but does not enter another state (for example, the agent does not enter the AVAIL state), the agent is still seen as in the ACD state. This field is real-time status data.

ACW	The number of agents in this split currently in After Call Work (ACW) for this split. This field is real-time status data.
AUX	The number of agents in this split currently in AUX work for this split. If an agent is on another split's call or in After Call Work (ACW) for another split, this agent is not considered in AUX work and is not be recorded here. This field is real-time status data.
Extn	The number of agents in this split currently on non-ACD (Automatic Call Distribution) calls, either incoming or outgoing directly to or from their extensions. If the agents are also in After Call Work (ACW) or AUX they is recorded as Extn rather than ACW or AUX. This field is real-time status data.
OtherSplit	The number of agents in this split on another split's call or in After Call Work (ACW) for another split. Only used if agents belong to multiple splits. This field is real-time status data.
AGENT	The name of the agent associated with the extension. If no name exists this field is left blank. This field is translation data.
EXT	The extension of the agent. This field is translation data.
STATE	The current state of the agent for this split. This possible states are Avail, ACD, ACW, AUX, Extn In, Extn Out, OtherSplit, and Unstaff. If an agent is staffed, the agent must also be in one of the above states. This field is real-time status data.
TIME	The clock time that the agent entered the current state in hours:minutes. This field is real-time status data.
ACD CALLS	The number of Automatic Call Distribution (ACD) calls (inbound and outbound), that the agent has completed for this split during the current period (half hour or hour). The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.
EXTN IN CALLS	The number of non-ACD (Automatic Call Distribution) calls that the agent has received (incoming) and completed during the current period. The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.
EXTN OUT CALLS	The number of non-ACD (Automatic Call Distribution) calls that the agent has made (outgoing) and completed during the current period. The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.

monitor health

This command displays the current system alarm summary, maintenance busy summary, user summary, critical system status, and cabinet status that are updated each minute.

After this command terminates, all users are logged off.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
monitor health			init inads craft cust nms browse	none	If standby SPE Emergency Transfer Select Switches change and handshakes are down, the displayed Emerg Trans field is incorrect until handshake reinitializes. When the monitor health command terminates, users are logged off of the system.

Output

The following example is a display of the **monitor system health** command.

```
status health

ALARM SUMMARY                      CABINET STATUS
  Major: 0
  Minor: 9
  Warning: 4
                                Emerg Alarms

Field descriptions

- Major The number of logged major alarms (0 – 200).
- Minor The number of logged minor alarms (0 – 200).
- Warning Number of warnings logged in the alarm file (0 – 200).
- Trunks Number of busied out maintenance trunks.
- Stations Number of busied out maintenance stations.

8 Maintenance Commands and Trouble-Clearing Aids
monitor health

8-175

Others	Combined number of busied out maintenance objects excluding trunks and stations.
Static	Proportion of the CPU currently dedicated to high priority items. This percentage is rounded to the nearest integer, therefore 0 percent means that the occupancy is less than one half of a percent.
SM	Proportion of the CPU currently dedicated to system management or periodic and scheduled maintenance. If large amounts of periodic or scheduled maintenance testing performs, this occupancy percentage can be high without affecting service. This percentage is rounded to the nearest integer, therefore 0 percent means that the occupancy is less than one half of a percent.
CP	Proportion of the CPU currently dedicated to call processing. This occupancy has priority over SM and IDLE occupancy categories and takes processor time away from these occupancy categories, if needed. This percentage is rounded to the nearest integer, therefore 0 percent means that the occupancy is less than one half of a percent.
Idle	Proportion of the CPU currently available. This percentage is rounded to the nearest integer, therefore 0 percent means that the occupancy is less than one half of a percent.
Active SPE	A or B indicate the currently-active processor complex. When the active processor complex is locked on-line with lock switching on DUPINT, the "lock" option displays; otherwise, "auto" displays.
Duplicated?	Duplication status of SPE components are indicated. Duplication = "y"; no duplication = "n".
SPE Power	Current power source for the processor complex. The normal state is "commercial". When commercial power is unavailable, in-use battery backup is indicated with "backup".
Time Source	Current timing source is displayed. The display values for this field vary according to timing sources selected. If the site administers the optional Stratum-3 hardware, "external" displays and "internal" displays when an internal source, such as a tone clock, is used. Primary and secondary timing sources must be administered when using the Stratum-4 option. "primary" = primary administered source is in use "secondary" = secondary administered source is in use. "local" = neither the primary or secondary sources are in use.
# Logins	Number of current users.
Cab	Assigned cabinet number, ranging from 1 to the highest cabinet number in the system.

Emerg Trans	Current setting of the emergency transfer switch for each cabinet. Five options are available: auto-on ("auto+" or "a+"), auto-off ("auto-" or "a-"), "on", "off", and "n.a.". If "auto+" or "auto-" option are enabled, emergency transfers automatically activate when cabinets fail ("+" indicates that emergency transfer is activated, while "-" indicates that emergency transfer is inactive). When "on" is displayed, emergency transfer automatically activates. The "off" option shows that cabinets cannot activate emergency transfers. In duplicated SPE systems, switch settings for both processors of the PPN (cabinet 1) display. In this case, "auto+" is abbreviated "a+", "auto-" is d "a-", and "off" is "of". "on" does not changed. If "n.a." displays, emergency transfer switch settings are not available.
Mj	Number of major alarms associated with the cabinet. An asterisk fills the field when the number exceeds 99.
Mn	Number of minor alarms associated with the cabinet. An asterisk fills the field when the number exceeds 99.
Wn	Number of warnings associated with the cabinet. An asterisk fills the field when the number exceeds 99.
PNC	Displays current Port Network Connectivity (PNC) status for each port network within a cabinet. When multiple port networks exist within a cabinet, a slash separates Carriers A, B, and C (listed first) from Carriers D and E (up/up). Availability of the Expansion Archangel Link (EAL) determines the PNC status of a port network. "Up" denotes EAL availability. When the EAL is not available, then "dn" (down) displays.
Time of Day	Displays current time of day acquired from the system.

monitor security-violations

This command displays information about failed attempts to access the system, including the time of the violation, the login entered, and the port accessed during the failed login attempt. The system logs trunk group numbers, members, and extensions for remote access violations. The system logs remote and local invalid access attempts with a total of 16 entries maintained for each access type. This online status report automatically updates every 30 seconds until the command is canceled by pressing the CANCEL key.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
monitor security-violations	<i>print</i>	Report sent to printer. Examples: monitor security-violations monitor security-violations print	init inads craft cust rcust bcms browse	none	none

Output

The following example is a display of the **monitor security-violations** command.

```
monitor security-violations                               SPE A

                SECURITY VIOLATIONS STATUS

                Date:   9:12 MON DEC 30 1991

SYSTEM MANAGEMENT VIOLATIONS          REMOTE ACCESS VIOLATIONS

Date  Time  Login  Port   Ext   Date  Time  TG No.  Mbr  Ext
12/30 09:12 init   MGR1   Ext   12/30 12:42  80      1   1111
12/30 09:12 init   MGR1
12/30 09:12 init   MGR1
```

Field descriptions

- Date: Current date and time.
- Date: Date of the logged security violation shown as MM/DD (where MM = month and DD = day).
- Time: Time of the logged security violation shown as HH:MM (where HH = the hour and MM = minute of the invalid access attempt).
- Login: Login ID entered for the login violation attempt.
- Port: Type of port used when login violation occurred. The following is a table of valid port types:
- MGR1: MGR1 represents a connection to a system SAT port. Connections are either hardwired or dialed-up.
- Ext: Extension assigned to the data module that failed during "logging in" session. If a data module is not used, this field is blank.
- Date: Date of the logged security violation shown as MM/DD (where MM = month and DD = day).
- Time: The time of the logged security violation shown as HH:MM (where HH = the hour and MM = the minute).
- TG No.: The trunk group number associated with the trunk from the failed remote access attempt (remote access violations only).
- Mbr: The trunk group member number associated with the trunk from the failed remote access attempt (remote access violations only).
- Ext: Extension that interfaces with remote access features (remote access violations only).

monitor system

The **monitor system view1** and **view2** commands summarize the system's condition. This on-line status report automatically updates every minute (or by pressing the UPDATE key) until the command is canceled by pressing the CANCEL key. For security reasons, the cancel command automatically logs of technicians.

Overall system status is available with either view option. "View1" displays attendant, maintenance, and traffic status. Attendant and maintenance status update every minute and traffic status updates hourly. "View2" displays all "view1" items, except hunt group measurements that are omitted from traffic status portions. These screens contain simplified high-level information about the system's health. The **monitor system conn** command displays connection's status in the connection manager process. Data is collected frequently in the connection manager for key information items used to create this report.

The single option to the command line entry, is **monitor system conn** and its parameter is *pnn*. The command line parameter *pnn* indicates the desired 3 pnn's.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
monitor system	<i>view 1</i> <i>view 2</i> <i>conn</i> <i>pnn ###</i> <i>pnn ###</i> <i>pnn ###</i>	see below Examples: monitor system view1 monitor system view2 monitor system conn monitor system conn pnn 1 5 7	init inads craft cust nms browse	none	none

Qualifier Description

- view1** This screen displays attendant status, maintenance status, last hour's measurement of trunk groups, hunt groups, attendant groups, and the time of day.
- view2** This screen displays a subset of view1 form entries. It includes view1 forms except the last hour's hunt group measurements.
- conn** This option displays the connection monitor output for key information.
- entering no options** Omitting "pnn # # #" arguments on the command line displays the default configuration of Pnn's 1, 2 and 3.
- pnn # # #** Entering "pnn # # #" (where a pnn number from 1 to 3 replaces "#", and displays data for specified pnn's.
- entering no options** Omitting the "pnn # # (# argument on the command line displays default configurations of Pnn's 1, 2 and 3.

pnn # # # Entering "pnn # # #", where "#" is replaced by a pnn number from 1 to 3, displays data for specified pnn.

Output

Below are displays of **monitor system view 1** and **monitor system view 2**.

```
monitor system view1
      ATTENDANT STATUS                               MAINTENANCE STATUS

Field descriptions

Console #	A list of console numbers that are activated or deactivated.
Activated:	The attendant console is active. An attendant console activated if: <ul style="list-style-type: none">■ its handset/headset is plugged in■ it is not busied out, and the system is in day service and the console is a day or day/night or principle console, or the system is in night service and the console is a night or day/night console.
Deactivated:	The attendant console is inactive. The attendant console deactivated if it does not meet activated conditions.
# of alarms for trunks	The number of existing minor and major trunk port alarms.
# of alarms for other resources	The number of existing minor and major alarms on all maintainable objects in the system, except trunks and stations.
First OSS number has been informed?	Questions if the first OSS telephone number reports and acknowledges alarms. If "Alarm Origination" is disabled or there are no active alarm, the field is "n".
Measurement Hour	The starting time for taking measurements. For example, if the measurement hour is shown as 1800, traffic status data display is the time period from 6 PM to 7 PM (The measurement is taken hourly).
Grp no	A number between 1 and the maximum trunk or hunt group number.
Grp dir	Group direction: incoming, outgoing or two way.
Calls qued	Total calls that arrive and are placed in the trunk group queue.
Calls aban	Total abandoned calls by the caller.
%Out blkg:	The ratio of outgoing calls that are not carried (due to overload conditions) on a trunk group to outgoing calls offered.
% Time ATB:	The percentage of time within polling intervals that all trunks in the trunk group are unavailable for use.
Time of day	The current time of day acquired from the system.

The following example is a display of the **monitor system conn** command.

```

Time Slot Status                Bus Status
Pnn   Bus   State  *Idle Count   Pnn   Bus   State

Field descriptions

- Time Slot Status** 4 numbers are associated with time slot status for each specified pnn; the two buses (0 and 1) have a maintenance and a normal state, and a number of idle counts. These fields represent real-time status data.
- Bus Status** Two numbers are associated with the two buses for each pnn. Shown are the pnn number; the associated bus (0 or 1); and the bus's state (avail or unavail). These fields represent real-time status data.
- Callrate** The callrate field represents call rates currently executing on the switch. This is a counter that is bumped for each call attempt. This field represents real-time status data.
- Interval** This field represents the interval applied to the call rate. It is normally a 36 second time period. This field represents constant status data.
- Max_callrate** This field represents the maximum call rate achieved since the last hour. If, at 20 minutes past 12:00, the system executes this command, the maximum call rate obtained during the past 20 minutes displays. This field represents real-time status data.
- Next_hour** This field contains a value of 0 or 1 depending related to measurements taken this hour or the next. This hour reflects maximum call rates. When this flag is set, statistics accumulate for the next hour and shortly thereafter.

<code>tot_ts_req</code>	This field holds the total time slots in use during the time period elapsed since the top of the last hour. Data is internally collected every 100 seconds. When the timer fires and the data collection occurs, a check is made as to how many time slots are currently in use. That's where the total comes from. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.
<code>ts_denied</code>	This field records total time slots requests denied since the beginning of the last hour. Data is collected internally every 100 seconds. Three numbers display for this field; one for each requested pnn. This field represents real-time status data.
<code>tot_fts_req</code>	This field represents the total number of requested fiber time slots. This field increments each time a fiber time slots is allocated since the last top of the hour measurement polling. Three values display; one for each requested pnn. This field represents real-time status data.
<code>ts_count</code>	The value in this field represents the requests for time slots during the last 100 second interim. An internal timer initiates polling every 100 seconds. Three numbers display for this field on the form; one for each requested pnn. This field represents real-time status data.
<code>ts_total</code>	This field represents the total number of time slots requested since the top of the last hour. This field represents real-time status data.
<code>fts_count</code>	The value in this field represents the requests for fiber time slots during the last 100 second interim. An internal timer initiates polling every 100 seconds. Three numbers display for this field; one for each requested pnn. This field represents real-time status data.
<code>fts_total</code>	This field indicates the total number of fiber time slots during the last 100 second interim. This field represents real-time status data.
<code>Requests-TN74</code> <code>8 TTRs</code>	This field reflects the total number of requested touch tone receivers that are currently-active. It decrements when tone receivers are freed and increments when they are requested. This field applies strictly to the TN748 board. This field represents real-time status data.
<code>Requests-TN74</code> <code>8 CPTRs</code>	This field reflects the total number of requested call progress tone receivers that are currently active. It decrements when call progress tone receivers are freed and increments when they are requested. This field applies strictly to the TN748 board. This field represents real-time status data.
<code>Requests-TN74</code> <code>4 CPTRs</code>	This field reflects the total number of requested call progress tone receivers that are currently active. It decrements when call progress tone receivers are freed and increments when they are requested. This field applies strictly to the TN744 board. This field represents real-time status data.

8 Maintenance Commands and Trouble-Clearing Aids
monitor traffic

8-183

Requests-TN74
 4 TTRs

This field reflects the total number of requested touch tone receivers that are currently active. It decrements when tone receivers are freed and increments when they are requested. This field applies strictly to the TN744 board. This field represents real-time status data.

Requests-TN74
 4 MFC

This field reflects the total number of requested multi-frequency receivers that are currently active. It decrements when multi-frequency receivers are freed and increments when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data.

monitor traffic

This command provides information on the number of trunk group and hunt group calls waiting to be serviced, and the time the oldest call in the group has been waiting for service.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
monitor traffic	<i>trunk-groups</i> <i>hunt-groups</i>	see below Examples: monitor traffic trunk-groups monitor traffic trunk-groups 4 monitor traffic hunt-groups	init inads craft cust rcust bcms browse	none	none

Qualifier Description

trunk-groups The number of trunk group calls waiting to be serviced, members in the group, and number of members that are active on calls in the group. This field displays up to 60 administered trunk groups. Technicians specify the starting trunk group. If technicians enter 5, the displayed trunks start at 5. Numbers 1-4 do not appear.

hunt-groups This field displays the waiting time for oldest call in each hunt group. Screen data updates every minute; only changed fields refresh. Unadministered hunt groups have blank values.

Output

The following output example is a display of the **monitor traffic hunt-groups** command.

```
monitor traffic hunt-groups

          HUNT GROUP STATUS      22:49 SAT DEC 31 1988
#   S   A   Q   W   LCIQ      #   S   A   Q   W   LCIQ
1   15  10  10  0   20      17
2                                     18
3                                     19
4                                     20
5                                     21
6                                     22
7                                     23
8                                     24  10  5  0  0  10
9                                     25
10                                    26

13                                    29
14                                    30
15                                    31
16                                    32

( #: Group; S: Grp Size; A: Active Members; Q: Q Length; W: Calls Waiting)
(LCIQ: Longest Call In Queue in seconds)
```

Field descriptions

- # Group number for trunk group or hunt group.
- S Number of members administered for each trunk or hunt group.
- A Number of group members that are active on a call. This does not include busied out members.
- Q The length of queues administered for groups.
- W Number of calls waiting in group queues to be serviced.
- LCIQ The longest call in queue (LCIQ) indicates the time in seconds the oldest call in the hunt group queue has been waiting to be serviced.

```
monitor traffic trunk-groups
```

```

                TRUNK GROUP STATUS   22:49 SAT DEC 311988
#  S  A  Q  W  #  S  A  Q  W  #  S  A  Q  W  #  S  A  Q  W
1  15 10  0  0
2  22 21 10 10
9  31 12 20  0
65 5  5 10  8
99 12  0  0  0
    
```

(#: Group; S: Grp Size; A: Active Members; Q: Q Length; W: Calls Waiting)

monitor trunk

This command displays internal software status information. This command helps to locate facilities to which the trunk is communicating.

If a trunk group number is entered without a member number, and with or without “/”, it is member 1. If a trunk group and member number are both entered, status for specified members displays.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
monitor trunk	<i>group</i>	1 – 99. If a group number is entered with out a member number, the member number defaults to 1.	init inads craft cust	1 (one)	none
	<i>member</i>	1 – 99. If a member number is entered, the member status displays. Examples: monitor trunk 78 monitor trunk 80/ monitor trunk 78/1 monitor trunk 80/2	rcus bcms browse		

Output

The following example shows the output from the **monitor trunk 78/1** command.

```
monitor trunk 78/1

                                TRUNK STATUS

Trunk Group/Member: 078/001      Service State: in-service/idle
Port: 01C1505                    Maintenance Busy? no
Signaling Group ID:              CA-TSC State:
Connected Ports:
```

Field descriptions

Trunk Group/Member	Trunk group and group member number. (1-99/1-99).
Port	The port location (cabinet-carrier-slot-circuit) for trunks.
Signaling Group ID	If the trunk is ISDN, this field contains the number of the ISDN Signaling Group. Otherwise, this field is blank.()
Connected Ports	Port locations (cabinet-carrier-slot-circuit) connected to the trunk.
Service State	In-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to the "end" of the trunk that has placed the facility in its current state.
Maintenance Busy	This field identifies maintenance testing that occurs on the trunk.
CA-TSC State	The state of temporary signaling connections. (connection set up to pass call information over PRI signaling links).

netstat ip-route

This command displays the routing tables that are resident in the C-LAN circuit pack. With the "board" option, the command **netstat ip-route board UUCss** displays the routing tables that are resident on the specified C-LAN circuit pack.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
netstat ip-route	<i>board UUCss</i>	Example: netstat ip-route board 01A03	init inads craft	none	none

Output

The following example shows the output from the **netstat ip-route** command.

```
netstat ip-route                               page 1 of xxx
                IP ROUTING - C-LAN

  Destination      Gateway          C-LAN Bd/Pt      Interface
1: .....          .....          01C0514          ppp13
2: .....          .....          01C0517          cmp0
3: .....          .....          01C0518          1o03
```

Field descriptions

Destination Fixed field giving the destination of the route. The destination is a name administered on the Node Name form which can include the keyword "Default," indicating the default route.

Gateway The node name of the Gateway by which the Destination can be reached. The Gateway must be a name administered on the Node Name form.

C-LAN Board/Pt The circuit pack location for the circuit pack that provides the interface for the route.

Interface

- **pppn** represents one of the PPP interfaces on the C-LAN, which is administered as port n+1.
- **cpm0** represents the ethernet interface on the C-LAN which is administered as port 17.
- **1o0** represents the loopback interface on the C-LAN which does not need to be administered.

ping ip-address

This command sends a "ping" to the given IP address and returns the port used to perform the test, the pass/fail results of the test, the round-trip delay time for successful tests, and the error code on tests that failed. You can also specify which circuit pack that is used to perform the test in the case of multiple C-LAN circuit packs.

If the command fails (for example, if the port or far end is not responding etc.), the system returns one of the following messages ([Table 8-3](#)):

Table 8-3. Ping command error messages

Message	Interpretation
www.xxx.yyy.zzz Internet address not assigned	The system cannot find the IP address.
Internet address not reachable from this board	The IP address is not in the route table of the specified board.
More than one default route exists, specify board	The IP address is not in the route table, and more than 1 C-LAN circuit pack has a default route.
Invalid internet address	Invalid Internet address parameter
"CCcss" is an invalid identifier; please press HELP	Invalid board location (when using the "board" option).
Error encountered, could not complete request	The internal error of not being able to find the port through which the IP address is reached.

Action/ Object	Qualifier	Qualifier Description	Permissions ¹	Defaults	Feature Interactions
ping ip-address	<i>ipadd</i>	The IP address of the device to ping Example: ping ip-address 192.68.3.26	init inads craft	none	none

1 The ping ip-address command is restricted to the init, inads, and craft logins. You can place additional restrictions on the command by selecting the object "ip-address" on the Restricted Object List:

Enter **change permissions loginid**, where loginid is an administered login such as inads) and press Enter.

Set the Additional Restrictions to **y** in the Administration Commands section of the form.

Go to the second or third page of the form.

Enter **ip-address** in the list of Restricted Objects and press Enter.

Output

The following example shows the output from the **ping ip-address 192.68.3.26** command.

PING RESULTS					
End-pt IP	Port	Port Type	Result	Time(ms)	Error Code
192.68.3.26	01C0202	PPP-PT	PASS	221	

Screen 8-5. Ping results

Field descriptions

End-pt IP	The actual TCP/IP destination address of the ping command.
Port	Location of the C-LAN circuit pack.
Port Type	Can be either PPP-PT for PPP ports (ports 1-16) or ETH-PT for the Ethernet port (port 17).
Result	PASS or FAIL
Time (ms)	The round-trip time (in milliseconds) of the ping.
Error Code	_____

ping node-name

This command performs a ping test exactly like the **ping ip-address** command, except you enter an administered node-name (**display node-names**).

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
ping node-name	<i>board repeat</i>	Example: ping node-name nname	init inads craft	none	none

Output

The command output looks the same as [Screen 8-5](#).

recycle carrier

This command recycles power for specified carriers. When power units are replaced in carriers, this command recycles that carrier's power. *Processor carriers and their duplicates and EPN control carriers or SCC carriers cannot be recycled. Carriers with active, recycled EIs, experience disrupted communications with their cabinets. Carriers with active, recycled tone-clock*

boards experience disrupted service for ports in port networks. For more details on recycling and trouble shooting power units, refer to “Troubleshooting Control Carrier Power Units” in [Chapter 5, “Routine Maintenance Procedures”](#).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout mis	location	Physical location of desired carrier. Carrier b-e. (b not applicable for SPE duplex PPNs)	init inads craft	cabinet = 1 none for carrier	see below

Feature Interactions

Carrier “a” cannot recycle its power. When carrier “b” of the PPN contains SPE duplication hardware, it cannot recycle its power.

Recycling maintenance objects results in:

Recycled component	Result
Port Carriers	Interrupted service
Carriers with active EIs	Disrupted communication with that cabinet
Carriers with active tone-clock boards	Interrupted service for ports port network

Carrier The list configuration command causes circuit packs to display red LEDs and NO BOARDS.

The **test tdm command** accelerates retirement of these problems.

Output

The following output example displays the **recycle carrier c** command.

```

recycle carrier c

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C      CARR-POW                126        PASS

Command successfully completed
    
```

Field descriptions

Port	Port address (cabinet-carrier) for tested maintenance objects. This field displays cabinet and carrier values.
Maintenance Name	CARR-POW.
Alt. Name	Not applicable.
Test Number	T126.
Test Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

refresh spe-standby

This command immediately places Standby SPEs into Standby Mode. This command preempts in-progress Standby SPE maintenance activity, resets the Standby SPE Processor, and refreshes the Standby SPE's DRAM memory (that is, all of Active SPE DRAM memory is shadowed to the Standby SPE memory). Refresh reactivates memory shadowing that is disabled while standby SPE is in maintenance mode. When Standby SPEs return to Standby Mode, their memory up-date with Active SPE memory.

Because it preempts Standby SPE maintenance activities, the **refresh spe-standby** command should be used judiciously. The following potential side-effects can occur:

- Tests that detect faults and/or lack of faults on Standby SPE components might not run. Accordingly, alarms are not raised or retired.
- Translation saves might not execute so translations data on Active and Standby SPE mass storage devices do not reflect the changes made since the last translation save.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
refresh spe-standby			init inads craft	none	Standby SPEs must be in maintenance mode before the refresh command can be invoked.

release access-endpoint

This command removes all ports associated with the specified access endpoint from a maintenance busy state. Periodic and scheduled tests subsequently resume on the released ports. Maintenance completes background initialization testing on the released ports. For details of the test sequence, refer to [3].

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release access-endpoint	extension	number associated with desired access endpoint. Examples: release access-endpoint 25012 release access-endpoint 77868	init inads craft nms	none	none

Output

The following example shows the output from the **release access-endpoint 22502** command and assumes that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

```

release access-endpoint 22502                page 1 of 1

                COMMAND RESULTS

Port Maintenance Name Alt. Name Result  Error Code
01C1101 WAE-PORT    22502    PASS
01C1102 WAE-PORT    22502    PASS
01C1103 WAE-PORT    22502    PASS
01C1104 WAE-PORT    22502    PASS
01C1105 WAE-PORT    22502    PASS
01C1106 WAE-PORT    22502    PASS

Command Successfully Completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of released maintenance.
Maintenance Name	The type of released maintenance object. (wideband access point = WAE-PORT, single port access endpoint = TIE-DS1).
Alt. Name	Alternate way to identify maintenance objects. This field contains the extension number of the access endpoint.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release board

This command activates administered maintenance objects on the circuit pack at specified locations. Tests are executed to ensure its usability.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release board	location	Physical location: PCsspp Examples: release board 01c11 release board 02c15	init inads craft nms	none	none

Output

The following example shows the output from the **release board 1c07** command and assumes that the board in cabinet 1, carrier c, slot 7 is an analog board with three ports administered.

```
release board 01C07

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01C07   ANL-BD
01C0702 ANL-LINE
01C0701 ANL-LINE      51001     PASS
01C0703 ANL-LINE      PASS
Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot) of released maintenance object.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	Alternate way to identify maintenance objects.
If the Object is	The field contains
station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
private CO line	P/xxx (where xxx = private CO line group number)
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release cdr-link

This command removes maintenance objects associated with specified call detail recording (cdr)-links from a maintenance busy state.

These links provide asynchronous data connections from switches to peripherals; they are composed of a:

- Far end data module
- Simulated data channel on a PKTINT board
- Manager that initiates and maintains the link
- Controller/protocol that services the link

For information on what a CDR link is and does, see the description of the [“status cdr-link”](#) command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release cdr-link	<i>link-id</i>	primary secondary Examples: release cdr-link primary release cdr-link secondary	init inads craft	none	none

Output

The following example shows the output from the **release cdr-link primary** command.

```
release cdr-link primary

                COMMAND RESULTS

Port  Maintenance Name  Alt. Name  Result  Error Code
PRI-CDR

Command successfully completed
```

Field descriptions

Port Not applicable. ()

Maintenance Name Type of released maintenance object. (primary cdr-link = PRI-CDR, secondary cdr-link = SEC-CDR)

Alt. Name	Not applicable. ()
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release data-module

This command activates the specified data module (or data channel). Hardware tests are executed to verify that the equipment is functioning.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release data-module	<i>extension</i>	Extension number associated with desired data module or data channel. Examples: release data-module 310	init inads craft cust nms	none	none

Output

The following example shows the output from the **release data-module 300** command.

```
release data-module 310

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01C1103  DIG-LINE          PASS

Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of the maintenance object that is busied out or released, or the number of the data channel.
Maintenance Name	The type of maintenance object that is being busied out or released.

Alt. Name	Alternate way to identify maintenance objects.
If the Object is	The field contains
station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
private CO line	P/xxx (where xxx = private CO line group number)
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release journal-printer

This command activates maintenance objects associated with a specified pms-log or wakeup-log link. Hardware tests are executed to verify that the equipment is functioning.

For general information on journal printer links, see the description of the ["busyout pms-link"](#) command.

For information on journal printers, see the description of the ["status journal-link"](#) command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release journal-printer	<i>pms-log</i>	releases links to pms printers. (1)	init inads craft nms	none	see below
	<i>wakeup-log</i>	Releases links to wakeup logging facilities. (0) Examples: release journal-printer pms-log release journal-printer wakeup-log			

Feature Interactions

Specific component maintenance performed on a link sometimes conflicts with link maintenance, itself. (busied out objects create link setup failure) Frequent link re-setup attempts may delay faulty component recovery. For best results, technicians should use busyout to disable attempted link re-setup.

Output

The following output example is a display of the **release journal-printer wakeup-log** command.

```
release journal-printer wakeup-log

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
0      JRNL-LINK          PASS

Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of busied out or released maintenance object. (wakeup log = 0; pms log = 1)
Maintenance Name	Type of busied out or released maintenance object.
Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release link

The **release link** command activates MOs associated with a specified link. Hardware tests are executed to verify that equipment is functioning properly.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release link	<i>link-id</i>	Number associated with each link (1–8). 1 through 4 reside on Processor Interface circuit packs “1a1” or “1b1” 5 through 8 reside on Processor Interface circuit pack “1a2” or “1b2.” Examples: release link 1 release link 8	init inads craft	none	none

Output

The following output example is a display of the **release link 1** command.

```
release link 1

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01C0301  PI-LINK                PASS

Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of the busied out or released maintenance object. Port address represents the link-id.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release mis

The **release mis** command activates management information systems. Hardware tests are executed to verify that equipment is functioning properly.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release mis			init inads craft cust rcust	none	none

Output

The following output example is a display of the **release mis** command.

```
release mis

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
          MIS
Command Successfully Completed
```

Field descriptions

Port	Not applicable.
Maintenance Name	MIS
Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release modem-pool

The **release modem-pool** command deactivates specified modem pool groups or group members. Specifying group numbers, member numbers releases single group members. Specifying modem pool group numbers releases members in a modem pool group.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release modem-pool	<i>group</i>	1-5.	init inads craft	none	none
	<i>member</i>	pair of analog and digital line ports (or two pair for the Integrated modem-pool case). 1-32. Examples: release modem-pool 1 release modem-pool 4/3			

Output

The following example shows the output from the **release modem-pool 1** command.

```
release modem-pool 1                SPE B
                                     COMMAND RESULTS
Port      Maintenance Name  Alt. Name  Result  Error Code
01C0701   MODEM-PT                PASS
01C0703   MODEM-PT                PASS
Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of busied out maintenance object.
Maintenance Name	MODEM-PT.
Alt. Name	This field is not applicable to this command.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release packet-control

This command activates the packet-control circuit pack, and reestablishes each terminated point-to-point signaling link on this packet-control. This command is the complement to the **busyout packet-control** command. (deactivates packet control and destroys terminated point-to-point signaling links).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release packet-control	<i>location</i>	simplex = location parameter not used. Duplicated = packet control carrier (1A or 1B) Examples: release packet-control 1A release packet-control 1B	init inads craft	simplex = cabinet 1, carrier A. duplex = cabinet 1. (no default carriers.)	see below

Feature Interactions

High or Critical Reliability Systems disallow attempts to release the packet-control that resides in the standby control complex.

When packet-controls in the active control complex are released from previous busied-out states, connectivity across Packet Buses reestablish. ISDN-BRI point-to-point signaling links reestablish with the **release packet-control** command.

Output

The following output example is a display of the **release packet-control 1A** command.

```
release packet-control 1A

                                COMMAND RESULTS

Port  Maintenance Name  Alt. Name  Result  Error Code

 1A      PKT-CTRL                PASS

Command successfully completed
```

Field descriptions

Port	Cabinet-Carrier where Packet-Control resides.
Maintenance Name	PKT-CTRL.
Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL).
Error Code	System-generated description of a command failure.

release pms-link

The **release pms-link** command deactivates MOs that are associated with a property management system link.

These links provide asynchronous data connections from switches to peripherals; they are composed of a:

- Far end data module
- Simulated data channel on a NETCON board

- Manager that initiates and maintains the link
- Controller/protocol that services the link

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release pms-link			init inads craft	none	see below

Feature Interactions

Specific component maintenance performed on a link sometimes conflicts with link maintenance, itself. (busied out objects create link setup failure) Frequent link re-setup attempts may delay faulty component recovery. For best results, technicians should use busyout to disable attempted link re-setup.

Output

The following output example is a display of the **release pms-link** command.

```
release pms-link
```

COMMAND RESULTS

Port	Maintenance Name	Alt. Name	Result	Error Code
	PMS-LINK		PASS	

Command Successfully Completed

Field descriptions

Port	This field is left blank.
Maintenance Name	PMS-LINK
Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release port

The **release port command** deactivates specified ports on circuit packs.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release port	<i>location</i>	Physical location: PCsspp Examples: release port 01c1101 release port 02c1501	init inads craft	none	none

Output

The following output example is a display of the **release port 1c0701** command. Assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port.

```
release port 01c0701
```

COMMAND RESULTS

Port	Maintenance Name	Alt. Name	Result	Error Code
01c0701	ANL-LINE		PASS	

```
Command successfully completed
```

Field descriptions

Port Port address (cabinet-carrier-slot-circuit) of released maintenance object.

Maintenance Name The type of maintenance object that is being released.

Alt. Name Alternate way to identify maintenance objects.

If the Object is The field contains

station extension

trunk xxx/yyy (where xxx = trunk group number and yyy = member number)

private CO line P/xxx (where xxx = private CO line group number)

Result Success status of a busied out object (PASS, ABORT, FAIL)

Error Code System-generated description of a command failure.

release pri-endpoint

The **release-PRI endpoint** command removes PRI endpoint ports (B-channels) associated with specified PRI endpoint from maintenance busy states. Periodic and scheduled tests resume on released ports. The switch attempts to negotiate with the far-end PRI terminal adapter activating PRI endpoint port (B-channel). Maintenance does background initialization testing on released ports. For details of the test sequence, refer to [3].

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release pri-endpoint	<i>extension</i>	extension number associated with desired PRI endpoint.	init inads craft nms	none	none

Output

The following output example is a display of the **release pri-endpoint 22501** command. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6.

```

release pri-endpoint 22501                page 1 of 1
                                           COMMAND RESULTS

Port      Maintenance Name Alt. Name  Result  Error Code
01B2001   PE-BCHL           22501   PASS
01B2002   PE-BCHL           22501   PASS
01B2003   PE-BCHL           22501   PASS
01B2004   PE-BCHL           22501   PASS
01B2005   PE-BCHL           22501   PASS
01B2006   PE-BCHL           22501   PASS

Command Successfully Completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of released maintenance object.
Maintenance Name	PE-BCHL.
Alt. Name	Alternate way to identify maintenance objects. (PRI endpoint extension)
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release sp-link

The **release sp-link** command reactivates busied out system printer links and resolves active alarms for system printer links.

The system printer link is a link from the switch to an external printer. Administering system printer extensions to call system printers creates the links.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release sp-link			init inads craft	none	none

Output

The following output example is a display of the **release sp-link** command.

```

release sp-link          SPE A

                        COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
      SYS-PRNT
Command Successfully Completed
    
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of busied out maintenance objects. ()
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	Alternate way to identify maintenance objects.
	If the Object is The field contains
	station extension
	trunk xxx/yyy (where xxx = trunk group number and yyy = member number)
	private CO line P/xxx (where xxx = private CO line group number)
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release spe-standby

The **release spe-standby** command removes busyout statuses of standby SPEs. Memory shadowing restores, a memory refresh of the standby SPE occurs, and 1 minute later the equivalent of scheduled standby SPE maintenance returns the standby SPE's Fault Severity Level to its appropriate value.

Standby SPE releases are allowed if communication to the standby is down.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release spe-standby			init inads craft	none	see below

Feature Interactions

When standby SPEs release a memory, a refresh executes and the standby Fault Severity Level lowers to its appropriate level. One minute later, the equivalent of scheduled standby SPE maintenance executes and a spontaneous SPE interchange might occur, depending of Fault Severity Levels of the two SPE's.

If the standby SPE is in poor health, memory shadowing must not enable (communication to the standby is impossible, if it is enabled). Then the standby SPE releases successfully.

Output

The following output example is a display of the **release spe-standby** command and assumes that the standby SPE is located in carrier "B."

```
release spe-standby          SPE A
                             COMMAND RESULTS
Port  Maintenance Name      Alt. Name  Result  Error Code
01B   STBY-SPE              PASS      PASS
Command successfully completed
```

Field descriptions

Port	Port address displays the standby SPE's cabinet and carrier location. (01A or 01B)
Maintenance Name	STBY-SPE

Alt. Name	Not applicable. ()
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release station

This command removes specified administered voice terminal extensions from a maintenance busy state.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release station	extension	extension number associated with the desired voice terminal Examples: release station 10020 release station 32770	init inads craft cust	none	none

Output

The following output example is a display of the **release station 1002** command.

```
release station 1002

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
01C1102   DIG-LINE         

Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit) of the released maintenance object.
Maintenance Name	Type of released maintenance object.
Alt. Name	Alternate way to identify maintenance objects. This field contains an extension when the object is a station.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release tdm

This command removes specified tdm buses from a maintenance busy state.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release tdm	port-network pn number bus bus	specifies the Port Network number of the TDM bus to be released. ("a" or "b") specifies desired half of the TDM bus. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. (1 - 3) Examples: release tdm port-network 1 bus a release tdm port-network 1 bus b	init inads craft	none	System tears down busied out buses. No new calls can be administered on busied out buses

Output

The following output example is a display of the **release tdm port-network 1 bus a** command.

```
release tdm port-network 1 bus a

                        COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
PN 01A    TDM-BUS          PASS

Command successfully completed
```

Field descriptions

Port	Port network number (preceded by "PN") and bus ("A" or "B") associated with the TDM bus.
Maintenance Name	TDM-BUS

8 Maintenance Commands and Trouble-Clearing Aids
release tone-clock

8-209

Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release tone-clock

This command removes specified tone/clocks from maintenance busy states.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release tone-clock	<i>location</i>	Physical location: PCsspp Examples: release tone-clock c	init inads craft	1 (one)	none

Output

The following output example is a display of the **release tone-clock 1a** command.

```
release tone-clock 1a

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01A    TONE-PT            PASS
01A    TDM-CLK            PASS
01A    TONE-BD            PASS

Command successfully completed
```

Field descriptions

Port	The tone clock circuit pack maintenance object displays the cabinet and carrier of the specified tone/clock board.
Maintenance Name	TONE-PT, TDM-CLK and TONE-BD
Alt. Name	Not applicable.
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

release trunk

The **release trunk** command removes specified trunk groups or trunk group members from a maintenance busy state. Specifying the group number, releases a single group member and the member number. Specifying the trunk group number releases members in a trunk group.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
release trunk	<i>group</i>	Group number (1–99)	init inads craft	none	none
	<i>member</i>	Member number (1–99) Examples: release trunk 78 release trunk 78/1			

Output

The following output example is a display of the **release trunk 78/1** command.

```
release trunk 78/1
```

COMMAND RESULTS

Port	Maintenance Name	Alt. Name	Result	Error Code
01C1505	CO_TRK	78/01	PASS	

Command successfully completed

Field descriptions

Port Port address (cabinet-carrier-slot-circuit) of the released maintenance object.

Maintenance Name The type of maintenance object that is being released.

Alt. Name Alternate way to identify maintenance objects.

If the Object is The field contains

station extension

trunk xxx/yyy (where xxx = trunk group number
and yyy = member number)

private CO line P/xxx (where xxx = private CO line group
number)

Result Success status of a busied out object (PASS, ABORT, FAIL)

Error Code System-generated description of a command failure.

reset board

This command performs a soft reset of every specified, administered port on the port circuit pack. Ports must be busied out before the port circuit pack resets.

WARNING:

This command is service disrupting and may cause extraneous alarms.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
reset board	<i>location</i> <i>repeat number</i>	Physical location: PCsspp Number of times each board reset repeats (1–00) Examples: reset board 01c11 reset board c08 reset board 03d12 r 3	init inads craft nms	carrier = 1 repeat number = 1	none

Output

The following output example is a display of the **reset board 1c07** command and assumes that the board in port network 1, carrier c, slot 7 is an analog board with three ports administered.

```
reset board 1c07
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C07	ANL-BD		53	PASS	

```
Command Successfully Completed
```

Field descriptions

- Port Port address (cabinet-carrier-slot) of the reset maintenance object.
- Maintenance Name Type of reset maintenance object.

Alt. Name	Alternate way to identify maintenance objects.
If the Object is	The field contains
station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
private CO line	P/xxx (where xxx = private CO line group number)
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Error Code	System-generated description of a command failure.

reset interface

This command resets the Processor Interface circuit pack, reads its associated software from tape, restarts applications processes, re-establishes permanent switched calls, and sets up each enabled link. If the interface cannot be established, a Major alarm raises on the interface and all enabled links deactivate. When the Message Server Adjunct (MSA), Distributed Communications System (DCS), Audio Information Exchange (AUDIX), or Call Management System (CMS) are initially administered, links for these applications and submitting the form restarts the interface. Before Processor Interface circuit packs are replaced, technicians must power down the switch and restart it. (unless the system is equipped with High or Critical Reliability)

For troubleshooting, see **status interface**, **status link**, and **status processor-channel** commands to locate problems before performing a **reset interfaces**. (link traffic is interrupted)

WARNING:

The interface command interrupts operation of the AP, DCS, AUDIX, CMS or ISDN-PRI.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
reset interface	<i>location</i>	(cabinet-carrier-position) of the processor interface (PI board). The position determines cleared processor interface circuit pack. first processor interface = 1 second processor interface = 2 Examples: reset interface 01a1 reset interface a2 reset interface 01b1 reset interface 01b2	init inads craft	none	none

reset maintenance

This command resets technician-specified EPN maintenance circuit packs. Specifying cabinets 2 or 3 resets EPN maintenance circuit packs in carrier “a” of the specified cabinet.

This command also drops a SAT terminal session on the reset EPN maintenance circuit pack. If this command runs from a EPN maintenance SAT terminal, reset results do not display.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
reset maintenance	location	Physical location of the EPN maintenance circuit pack (carrier number). Examples: reset maintenance 02 reset maintenance 2 reset maintenance 3a	init inads craft	none	SAT is dropped before reset results can display, when command runs from EPNSAT. Examine error and alarm logs for “MAINT” entries to determine reset success.

Output

The following output example is a display of the **reset maintenance 02a** command.

```
reset maintenance 02A
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
02A	MAINT		306	PASS	

```
Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot) of the reset MO.
Maintenance Name	MAINT
Alt. Name	Not applicable. ()
Result	Success status of a busied out object (PASS, ABORT, FAIL)
Test No.	306.
Error Code	System-generated description of a command failure.

reset spe-standby

The **reset spe-standby** command converts standby SPEs from standby mode to maintenance mode with the defined restart level. This command applies to high or critical reliability systems.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
reset spe-standby	<i>level</i>	1 = Warm Restart 2 = Cold-2 3 = Cold1 4 = Reboot 5 = Extended Reboot Examples: reset spe-standby 1 reset spe-standby 2 reset spe-standby 3	init inads craft	none	see below

Feature Interactions

This command invokes standby SPE initialization like low level maintenance. Software never escalates requested reset levels. Technicians always determine reset levels.

If the standby SPE contains a software memory card and the requested restart level is 4 or 5, the standby SPE reloads system software before rebooting.

reset system

This **reset system** command is increasingly destructive as reset levels increase.

This command switches control from currently-active SPEs to standby SPEs in a High or Critical Reliability System through HOT restart interchanges. **Once planned interchanges start, they cannot abort from the CANCEL key.** If **reset system interchange** commands are rejected because standby SPE Fault Severity Levels are higher than active SPEs, the **health-override** command can force a HOT interchange.

The **reset system interchange** command does not disrupt in-progress calls. However, it drops links (including CDR and PMS) to local and remote administration terminals. It also drops and re-establishes connections on the Network Control Circuit Pack data channels. During the interchange, callers cannot place calls, but current calls are unaffected.

When a system restart occurs with the corresponding vector bit set, a core dump is written to memory card, only if the memory card is the special core dump card), the vector is cleared, and the requested restart is performed.

All successful reset system commands log users off.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
reset system	<i>level</i> <i>interchange</i> <i>health-override</i>	See below Examples: reset system 1 reset system 2 reset system interchange health-override	init inads craft	none	see below

level Reset levels are entered numerically:

- 1 = Warm Restart
- 2 = Cold-2
- 3 = Cold1
- 4 = Reboot
- 5 = Extended Reboot

interchange System control passes to standby SPEs as active and standby SPEs change roles. The optional "health-override" qualifier can be entered to bypass Fault Severity Levels of standby SPEs to force an interchange. SPE alarm components determine Fault Severity levels. Each component is assigned a severity level, and the most severe SPE alarm defines Fault Severity Levels for SPEs. The following table lists maintenance objects, their alarms, severities and interchange restart levels that affect SPE Fault Severity Levels.

Maintenance Object	Alarm Level	On/Off Board	Fault Severity Level	Restart Level
STBY-SPE	WARNING	OFF	120	None
MEM-BD	MAJOR or MINOR	ON	110	Hot or Warm
MEMORY	MAJOR or MINOR	ON	110	Hot or Warm
STBY-SPE	MAJOR	ON	100	None
PROCR	MAJOR	ON	70	Hot or Warm
SW-CTL	MAJOR	ON	65	Cold 2
MEM-CARD	MAJOR	OFF	65	Cold 1
12V-PWR	MIN	ON	65	Hot
DUPINT	MAJOR	ON	61	Hot
CARR-POW	MAJOR	ON	61	Cold 2

Maintenance Object	Alarm Level	On/Off Board	Fault Severity Level	Restart Level
SHDW-CIR	MAJOR	ON or OFF	60	Warm
SHDW-LINK	MAJOR	ON	60	Warm
SW-CTL	MINOR	ON	40	Hot
PR-MAINT	MINOR	ON	30	Hot
PI-BD	MAJOR or MINOR	ON	20	Hot
PKT-CTRL	MAJOR	ON or OFF	20	Hot
PKT-CTRL	MINOR	ON or OFF	15	Hot
PI-PT	MAJOR	ON	15	Hot
DATA-CHL	MINOR	ON	15	Hot
DATA-CON	MINOR	ON	15	Hot
DATA-BD	MINOR	ON	15	Hot
MEM-CARD	MINOR	ON or OFF	10	Hot
PR-MAINT	MINOR	OFF	8	Hot

A **reset system interchange** command aborts if:

- The standby SPE is down
- The active SPE is locked active
- Communication to the standby SPE is not possible
- Memory shadowing to the standby SPE is not functioning
- The standby SPE is not fully refreshed
- The standby SPE is busied out

health-override

If HOT restart interchanges fail because Fault Severity Levels of standby SPEs are higher than active SPEs, the health-override command tries to force a switch. If the switch occurs, new active SPE Fault Severity Level raises to prevent a software-initiated HOT SPE interchanger. This artificial raising of active Fault Severity Levels lasts for one hour, then Fault Severity Levels of both SPEs returns to their normal values.

Feature Interactions

- The **reset command** invokes system initialization like low level maintenance. Software never escalates requested reset levels. Technicians determine the levels.

- Two hardware switches are associated with active and standby SPEs. These hardware switches override demand maintenance activities requested by system technicians. If active SPEs are locked active with these hardware switches, interchanges do not occur until the active is unlocked.
- Successful SPE interchanges logoff PPNSAT terminals.
- Restart levels null the effect of the health-override option.

restore announcements

This command copies announcement data from the active MSS devices to announcement boards.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
restore announcements	<i>print</i> <i>schedule]</i>	Report sent to printer. Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: restore announcements	init inads craft cust rcust	Tape-based: Announcement copies from active processor's tape to the announcement board. Card-mem based: Announcement data copies from active processor's to the announcement board.	see below

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

WARNING:

Manager I is blocked for other activities until the command completes (up to 45 minutes)

- If no announcement data module and no NETCON data module are administered, the system denies the command.
- If the announcement data module port is out of service or active (for example, performing an announcement playback), the system denies the command.

- If users are in integrated announcements sessions, the system denies the command.
- If the board is currently uploading or downloading, the system denies the command. Users cannot save or restore announcement after the **restore announcements** command commences.
- If no tape is in the tape drive when users attempt a copy, the command aborts.
- If the MSS is in use by another user or maintenance, the **restore announcements** command is not allowed.
- Unsaved or corrupted announcement files on the MSS, disallow the **restore announcements** command.

To prepare for a failure, users should copy announcement files to announcement boards. If errors result from hardware or firmware failures, MSS software logs hardware errors with maintenance. When errors occur, the system continually attempts to download boards in 10-minute intervals until a download succeeds, announcements record, or downloads initiate from the SAT. Then, error messages display indicating corrective action. If errors result from hardware or firmware failure, MSS software logs a hardware error with maintenance. Maintenance software invokes tests to diagnose and attempt to correct the problem. If maintenance software fails to correct problems, alarms raise indicating additional corrective action.

When the system crashes and/or a spontaneous processor interchange occurs, the restore operation fails. Valid announcement files do not appear on the announcement board. To copy the announcements from the active processor's MSS device to the announcement board, restart the command on the newly-active processor. When announcements completely copy to announcement boards, calls do not connect to announcements on the ANN board.

When announcement boards are plugged in or reset, maintenance performs a series of tests, including a DRAM Checksum test. Tests fail due to power losses to boards, resulting in automatic downloading of announcement files.

Output

The following output example is a display of the **restore announcements** command on a simplex SPE system.

```
restore announcements           Page 1 of 1  SPE A
                                RESTORE ANNOUNCEMENTS
Processor  Command Completion Status      Error Code
SPE-A     Success                          0
```

Field descriptions

Processor	Displays the processor that houses the MSS device used to copy announcement data.
Command Completion Status	Specifies successful completion of the command.
Error Code	System-generated description of a command failure.

resume hardware-group

The **resume hardware-group** command resumes the previous **test hardware-group** command its canceled position. Entering another **test hardware-group** disables the **resume hardware-group** command.

A canceled **test hardware-group** command appears as “canceled” on the **status hardware-group** screen. A resumed **test hardware-group** command appears as “active” on the **status hardware-group** screen.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
resume hardware-group			init inads	none	none

Feature Interactions

Cancel hardware-group

Cancelling a test hardware-group command deactivates the test command. The status hardware-group screen displays the state as “canceled”.

When the **resume hardware-group** command is entered to resume a previously-canceled **test hardware-group** command, the state of the test command changes to 'active' on the **status hardware-group** screen.

save announcements

This command copies announcement data from the announcement board to the MSS. The Card-Mem stores announcements for the system. By default, announcement data writes to the MSS device in a simplex processor (SPE) system, or to both MSS devices in a High or Critical Reliability System. Also, the save announcements command can write to the MSS device on either processor, in a High or Critical Reliability System.

If there integrated announcement boards exist, this command is allowed. The system denies the **save announcement** command if no announcement data modules and no NETCON data modules are administered.

Simplex

In a simplex system, no options for the **save announcements** command exist. This command saves announcement files to the MSS device.

Duplex

If no options are specified, the system saves announcements to both processors' MSS devices.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
save announcements	<i>spe-active</i>	forces the system to write announcement data to specified devices in active processors.	init inads craft cust rcust	none	see below
	<i>spe-standby</i>	forces the system to write announcement data to specified device s in standby processors. Examples: save announcements save announcements spe-active save announcements spe-standby			

Feature Interactions

WARNING:

Manager I is blocked for other activities until the command completes (up to 45 minutes).

- If no announcement and no NETCON data module are administered, the system denies the command.
- If the announcement data module port is out of service or active (performing an announcement playback), the system denies the command.
- If no announcements are on the board or a user is in an integrated announcements session, the system denies the command.

- If the board is currently uploading or downloading, the system denies the command. Users cannot record integrated announcements after the **save announcements** command commences even though 15 channels are available for announcement playback (one is reserved for uploading and downloading).
- If no tape is in the tape drive or the tape is write-protected, the command aborts during a save. The command also aborts if no NETCON data module is available.
- The save announcements command is not allowed if the MSS is in use. The MSS may be in use by either another user or by maintenance.
- The standby processor must be in service with shadowing enabled, so that the system can save announcements to the standby processor.
- When MSS devices on both processors in High or Critical Reliability Systems are specified, the save announcements command saves announcement data from announcement boards to active MSS devices, then to standby MSS devices. The system reports the status of each save operation to users separately. When one save operation fails, the save operation to another device continues, causing saved announcement data to be inconsistent between MSS devices.
- In case of a failure, technicians make announcement files consistent across both MSS devices. Files become inconsistent due to hardware failures or spontaneous processor interchanges. If announcement files are inconsistent due to hardware failures that occur during the **save announcements** command, error messages display indicating corrective action. Maintenance software that monitors hardware logs hardware errors to maintenance. Then, maintenance software invoke tests to diagnose and attempt corrective action. If maintenance software fails to correct the problem, an alarm raises displaying corrective action.
- The **save announcements** command writes two time-stamped, identical copies of announcement data to selected devices. The time-stamp for both copies is the same. Each copy contains a timestamp and the state of the copy (good or bad).
- If good copies of announcement files are not available, the restore announcements command cannot execute until the **save announcements** command completes. Announcements on the board are still usable.

Output

The following output example is a display of **save announcements** command on a simplex SPE system.

```
save announcements          Page 1 of 1  SPE A
                             SAVE ANNOUNCEMENTS
Processor  Command Completion Status      Error Code
SPE-A     Success                        0
```

Field descriptions

Processor	Displays processors when announcement data writes to its devices. (spe-a and spe-b)
Command Completion Status	This field specifies if the command succeeded.
Error Code	0 = successful save 1 = could not write to active spe device 2 = could not write to standby spe device

save translation

This command allows users to save to tape or memory card the in-memory translation data. This command runs as part of scheduled maintenance and/or on demand by the technician. All translation data in memory during system operation is volatile, meaning that if the switch goes down, the system loses all data.

Simplex

The system defaults to save translation to the memory-card on SPE_A.

Duplex

The system defaults to save translation to the memory-card on both SPE-A and SPE-B.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
save translations	<i>spe-active</i>	identifies that save translations should occur on the active processor's MSS device.	init inads craft cust	Simplex = SPE A; Duplex = SPE A & SPE B	Command cannot be performed if data is being changed by an administrative command.
	<i>spe-standby</i>	identifies that save translations should occur on the standby processor's MSS device. Examples: save translation save translation spe-active save translation spe-standby			

Output

The following output example is a display of the **save translation** command on a duplex system. Error Codes are as follows:

- 0 - save successful
- 1 - could not write to the active device
- 2 - could not write to the standby device

```

save translation

                                SAVE TRANSLATION

Processor  Command Completion Status      Error Code
SPE-A     Success                        0
SPE-B     Success                        0

Command Successfully Completed
    
```

Field descriptions

Processor Identifies the processor carrier where translation data saves. (SPE-A, or SPE-B.)

Command Completion Status Displays a variety of messages, identifying the success or failure of the command.

set expansion-link

The set expansion-link command sets the Expansion-Interface Link between:

- the PPN and an EPN
- two EPNs to a specific Interface Link circuit pack between PPN and EPN.

NOTE:

This command can corrupt any active data links between the PPN and an EPN or between two EPNs.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set expansion-link	<i>link-identifier</i>	1A01, 1A02, 1B01, 1B02, 2A01, 2A02, 2B03, 3A01, 3A02, 3AB02, 3B03). Examples: set expansion-link 02a01 set expansion-link 3a02	init inads craft	none	none

set options

This command enables the technician (that is, remote user with INADS permission) to select which types of maintenance categories report alarms automatically and which types require customer call-in. Judicious use of this command can reduce the number of ineffective alarms to the TSC. For effective results, technicians should use the **set options** command default settings specified in this section. Technicians should not change these settings. Special circumstances (for example, special studies) may require temporary changes under the guidance of Tiers 3 and 4.

NOTE:

Alarms do not upgrade.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set options			init inads	see below	none

Form Input

The following example is a display of the **set options** command.

```
set options Page 1 of 8
```

10: 1	20: 1	30: 1	40: 1	50: 1	60: 1	70: 1	80: 1	90: 1	

NOTE:

Remaining Trunk Group information displays on pages 3-8, and is not documented in this Manual.

The first page of the Alarm Reporting Options Form, provides the following alarm options: the four trunk alarm severity groups, the adjunct alarms, off-board DS1 alarms, and PI-LINK alarms, memory card translation capacity alarms, and other

off-board alarms. The second page, known as the Alarm Reporting Options Form, provides alarm severity groups to each trunk group.

1. The following alarm options are available:

- Minor

Maintenance testing discovers raised alarms, downgrades them to minor alarms, and deactivates alarmed resources. LEDs on the port board and maintenance board follow standard minor alarm LED protocol and call receiving OSSs.

- Warning

Maintenance testing discovers raised alarms, downgrades them to warnings and deactivates alarmed resources. The Alarm Log pinpoints customer-reported trunk or station problems. Alarm LEDs light on the port circuit pack and Maintenance circuit pack as before, but no attendant LEDs or stations reporting alarms are affected. No call is placed to INADS.

- Report

The report option treats alarms the same as warnings with one exception: alarms report to INADS with a special WARNING category. When this type of alarm is received, INADS logs the occurrence and creates a trouble ticket or closes it immediately. Retry strategy for this type of call is similar to normal Major or Minor alarm reports. However, the acknowledgment LED on the attendant console or alarm reporting station does not reflect the status of the call.

- Yes

Alarms raise normally without filtering alarm data.

- No

Alarms that raise on trunks, stations, or adjuncts in this category drop. Error information displays as before, but alarm is evident. LED is inactive and calls are not sent to INADS. Because resources are deactivated without any record, this option is recommended only when other options do not provide desired results.

Technicians can administer alarm options on a system-wide basis for the following categories:

- Major on-board station alarms
- Minor on-board station alarms
- Major off-board station alarms
- Minor off-board station alarms

Trunk alarms have four alarm severity groups with administrable alarm options in the categories listed below. For G1, technicians can administer alarm options on a system-wide basis for the following categories:

- Major on-board trunk alarms

- Minor on-board trunk alarms
- Major off-board trunk alarms
- Minor off-board trunk alarms

Technicians assign alarm severity options to the following Adjunct categories:

- Major on-board adjunct alarms
- Major off-board adjunct alarms
- Minor on-board adjunct alarms
- Minor of-board adjunct alarms

Technicians can administer options for Minor off-board DS1 Interface circuit pack alarms and Minor off-board Memory Card Capacity Alarms on a system-wide basis.

The system inspects alarm reporting options information in the Alarm Reporting Options Form as translation data and preserves it through all restart levels.

This command affects the MO alarming listed below. Neither the trunk nor the station category applies to alarms raised on the common portion of the circuit pack.

If the option associated with the alarm type is set to “n,” the system drops the alarm report. Alarm error information remains intact, but no records of alarms and no LEDs light on the port circuit pack, the Maintenance circuit pack, the attendant console, or alarm reporting station to indicate a problem.

If technicians set the option “warning” or “report,” port circuit pack LEDs and LEDs on the Maintenance circuit pack are affected the same as warning alarms.

Default parameters are:

- The system downgrades all station, trunk (except on-board trunk alarms), and Minor DS1-BD alarms to warning alarms.
- On-board Major and Minor trunk alarms, and the Memory Card Capacity alarm continue to raise alarms and report to INADS.

Station MOs Affected By This Command

NOTE:

Although alarms on some MOs appear as warnings, they should be investigated with user-reported problems.

- Analog Lines (ANL-LINE, ANL-NE-L, ANL-16-L)
- Digital Lines (DIG-LINE)
- Hybrid Lines (HYB-LINE)

- MET Lines (MET-LINE)
- ISDN-BRI Lines (BRI-PORT, BRI-SET)

If more than 75% of the members of the trunk group alarm, minor alarms escalate to major alarms. If the trunk category option is set to “warning,” “minor,” “report,” or “no,” this no longer happens. Maintenance reactivates individual trunk members according to Major and Minor alarm criteria.

Trunk MOs Affected By This Command:

NOTE:

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- Auxiliary Trunks (AUX-TRK)
- Central Office Trunks (CO-TRK)
- Direct Inward Dialing Trunks (DID-TRK)
- Direct Inward and Outward Dial Trunks (DIOD-TRK)
- DS1 Central Office Trunks (CO-DS1)
- DS1 Direct Inward Dialing Trunks (DID-DS1)
- DS1 Tie Trunks (TIE-DS1)
- ISDN Trunks (ISDN-TRK)
- Tie Trunks (TIE-TRK)

Circuit Pack MOs Affected By This Command

NOTE:

Although alarms on some MOs appear as warnings, the alarms should be investigated with user-reported problems.

NOTE:

The alarm severity of group one downgrades trunks that are not members of Trunk Groups, (for example, PCOLs).

- DS1 Interface Circuit Pack (DS1-BD)

Adjunct-Related MOs Affected By This Command

NOTE:

Although alarms on some MOs appear as warnings, the alarms should be investigated with user-reported problems.

- ASAI Adjunct (ASAI-ADJ)
- Lucent Adjunct Port (ATT-PORT)
- Ethernet ASAI Port (LGATE-PT)
- Ethernet ASAI Adjunct (LGATE-AJ)
- Ethernet Lucent Port (ATTE-PT)
- Ethernet Lucent Adjunct (ATTE_AJ)
- ISDN-BRI Ports connected to Adjuncts (ABRI-PORT)

Adjuncts are administered as stations; however, the administration of alarm severity for the station alarm group does not affect alarm severity levels for adjuncts. Similarly, the administration of alarm severity for the adjunct alarm group does not affect the alarm severity levels for other stations.

PI-Link and Associated Link MOs Affected by this Command:

NOTE:

Although alarms on some MOs appear as warnings, the alarms should be investigated with user-related problems.

- See Processor Interface Link ["PI-LINK (Processor Interface Link)"] for other associated Link Maintenance Objects.

Memory Card MOs Affected by This Command

NOTE:

While this option does not automatically downgrade CAP-MEM alarms, changes to this options may downgrade alarms to warnings. This alarm raises when memory card translation capacity exceeds 98% and is intended to alert Services that larger flash cards may be required.

- Memory Card Capacity (CAP-MEM)

Other MOs Affected by this Command

NOTE:

Although alarms on some MOs appear as warnings, the alarms should be investigated with user-related problems.

- EPN Maintenance Circuit Pack (MAINT)
- Expansion Interface (EXP-INTF)
- ISDN-PRI Signaling Group (ISN-SGR)
- Journal Printer (JNL-PRNT)
- PMS Link (PMS-LINK)
- PMS log printer (PMS-LOG)
- Primary CDR Link (PRI-CDR)
- Secondary CDR Link (SEC-CDR)
- SPE Select Switches (SPE-SELEC)
- Synchronization (SYNC)
- System Communication Interface (PI-SCI)
- System Printer (SYS-PRNT)
- TDM Clock (TDM-CLK)
- Tone Generator Circuit Pack (TONE-BD)

set signaling-group

This command upgrades secondary D-channel in specified signaling groups to primary D-channels. Current primary D-channel then revert to secondary D-channels.

A signaling group is a collection of B-channels that designate single D-channels or a set of D-channels signals over an ISDN-PRI.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set signaling-group	group identifier	administered number associated with each signaling group. Examples: set signaling-group 1 set signaling-group 2	init inads craft	none	none

set synchronization

This command sets DS1 trunks or active tone/clock circuit packs that supply references for synchronization. The **set synchronization** command works after the **disable synchronization** command disables synchronization. Technicians may administer DS1 trunks or active tone/clocks with the **set synchronization** command. DS1 or tone/clocks remain synchronization references until the **set synchronization** command runs with another board or until the **enable synchronization** command runs.

After the **enable synchronization** command runs, administered primary or secondary synchronization sources become synchronization references. If no primary or secondary source is administered, synchronization uses active tone/clock boards as synchronization references after synchronization is enabled.

The synchronization subsystem provides error-free digital communication between the switch and other PBXs, COs, or customer premise equipment. System components involved in synchronization include: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set synchronization	<i>location</i>	Physical location: PCsspp (DS1 trunk or active tone/clock) that supplies a synchronization reference. Examples: set synchronization 01c08 set synchronization 02a01 set synchronization 01a set synchronization 02c	init inads craft	none	none

set tdm

This command establishes the TDM bus on a port network that houses control channels and dedicated tones.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set tdm	port network	specifies the Port Network number of the TDM bus.	init inads craft	none	see below
	pn number bus	("a" or "b") specifies desired half of the TDM bus. Configure each 512 time slot TDM bus as two duplicate 256 time slot buses, allowing duplication of control channels and dedicated tone time slots. A port network number (1 - 3)			
	bus override	forces the setting of a deactivated bus, or a bus whose dedicated tone time slots are active. Examples: set tdm port-network 2 bus a set tdm port-network 2 bus b override			

Feature Interactions

New calls go to time slots reserved for tones on the bus that have not other time slots when:

- Time slots on a specified bus are in use
- Dedicated tone time slots are on the other half of the bus

A **set** command to buses that have calls on dedicated tone time slots drops these calls.

set time

This command allows system technicians to change the day of the week, the day of the month, the month, year, hour, and minute. The second field resets to zero (0) whenever the time on the clock is altered, but cannot be modified by the technician. The day of the week, entered as a text string, translates to an integer for internal storage.

The system clock time remains the same if no changes are entered on the form.

8 Maintenance Commands and Trouble-Clearing Aids
 set tone-clock

8-233

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set time			init inads craft cust rcust bcms browse	The system assigns a time, if the system clock is not set	The date and time are available to software from a system primitive.

Output

The following example is a display of the **set time** command.

```

set time                                     Page 1 of 1

                                DATE AND TIME

DATE
  Day of the Week: _____ Month: _____
  Day of the Month: __         Year:  ____

TIME
  Hour:  __         Second:
  Minute: __
    
```

Field descriptions

- Day of the Week: Monday through Sunday.
- Day of the Month: 1-31. The system also checks for leap year.
- Month: January through December.
- Year: 1970-2999
- Hour: 0-23.
- Minute: 0-59
- Second: The system sets this field to zero when the time of day clock is set.

set tone-clock

This command sets the active tone/clock for a PN that has a duplicated tone/clock circuit pack. Technicians should reset the default active tone clock in each PN after using the **set tone-clock** command. If it is not in use, a single failure can cause an unnecessary service outage. The schedule maintenance tone-clock switch option does not reset the tone-clock to the default active if it was not active at the beginning of the test.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set tone-clock	<i>location</i>	Physical location (PC) of the tone/clock to be tested	init inads craft	1 (one)	none
	<i>override</i>	Forces the set command into effect regardless of the tone/clock circuit pack's health. Examples: set tone-clock 01b set tone-clock 1b set tone-clock 01b override set tone-clock a			

set vector

This command specifies restart levels for core dumps. This command places core dumps on primary Mass Storage System (a tape in a tape system and core dump memory cards in a memory card system) devices for later examination. The **set vector** command allows technicians to tailor restart levels that copy memory to primary Mass Storage System devices.

NOTE:

Software never requests an extended reboot.

To force an immediate core dump, in a simplex or duplex system, technicians should set the appropriate bit using this command, then enter the **reset system** command at a level that forces core dumps corresponding to set vector bits.

When a system restart occurs in a simplex Switch Processing Element (SPE) system with the corresponding vector bit set, the core dump writes to secondary storage (the primary MSS device). Once core dumps write, the vector clears and the restart executes. **This command disrupts service in a simplex system.**

The active SPE executes a core dump when:

- A system restart occurs on the active SPE in a High or Critical Reliability system with the corresponding vector bit set.
- The active SPE-active option is selected when the vector bit is set.

CAUTION:

This command disrupts service in a simplex system.

The active SPE executes a core dump when:

- A system restart occurs on the active SPE in a High or Critical Reliability system with the corresponding vector bit set.
- The SPE-standby option is selected when the vector bit is set.

The active SPE executes a core dump when:

- A system restart occurs on the active SPE in a High or Critical Reliability system with the corresponding vector bit set.
- The active SPE-maint option is selected when the vector bit is set.

The vector clears after all core dumps.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
set vector	<i>spe-standby</i> <i>spe-active</i> <i>spe-maint</i>	see below. SIMPLEX SYSTEM Examples: set vector f set vector 9 DUPLEX SYSTEM Examples: set vector f spe-standby set vector f spe-active set vector f spe-maint set vector 9	init inads craft	spe-standby (High or Critical Reliability Systems)	none

Vector-Condition Mapping

value	WARM	COLDII	COLDI	REBOOT
0	n	n	n	n
1	y	n	n	n
2	n	y	n	n
3	y	y	n	n
4	n	n	y	n
5	y	n	y	n
6	n	y	y	n
7	y	y	y	n
8	n	n	n	y
9	y	n	n	y
a	n	y	n	y
b	y	y	n	y
c	n	n	y	y
d	y	n	y	y
e	n	y	y	y
f	y	y	y	y

spe-standby The default option for a High or Critical Reliability System. If a restart occurs on active SPEs and the corresponding vector bit is set, a core dump occurs on the standby SPE (after the standby SPE has performed a memory refresh).

spe-active Option for a High or Critical Reliability System; default for simplex SPE systems. If a restart occurs on active SPEs and the corresponding vector bit is set, core dumps occur on the active SPE. **This option disrupts service.**

spe-maint Available for High or Critical Reliability Systems. If restarts occur on active SPEs and the corresponding vector bit is set, core dumps occur on standby SPEs without the standby SPE a memory refresh.

status access-endpoint

This command displays diagnoses internal software and helps to locate facilities with which Access Endpoints communicate.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status access-endpoint	extension	extension number of the access endpoint	init inads craft cust nms browse	none	none
	print	prints reports to SAT printers. Examples: status access-endpoint 25012 status access-endpoint 77868 status access-endpoint 66078 print			

Output

The following output example is a display of the **status access-endpoint 22502** command. Assume that access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6 — that access endpoints are connected on an active call to ports 7 to 12 of the board in location 1B19 (cabinet 1, carrier B, slot 19). This means that port 01C1101 connects to 01B1907, port 01C1102 connects to 01B1908, and port 01C1103 connects to 01B1909.

```
Command Successfully Completed
```

Field descriptions

Extension	The extension of the access endpoint to be displayed.
(Starting) Port	Port locations of the access endpoint. For wideband access endpoint, the location shown is that of the starting port.
Communication Type	The valid voice and data communication type that the access endpoint is administered. The options are: 56k-data, 64k-data, voice-grade-data, and wideband.
Width	For communication types of 56k-data, 64k-data, and voice-grade data, the width value is 1. For communication type of wideband, this field displays the number of DS0s that makes up the access endpoint.
Service State	Whether the access endpoint is in-service or out-of-service. One of the following states displays: in-service/active, in-service/idle, and out-of-service.
Connected Ports	Port location connected to the access endpoint for an active call. For wideband access endpoint connection, all ports connected to the wideband access endpoint are listed.

status administered-connection

The **status administered-connection** provides automatic end-to-end connections between two access/data endpoints.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status administered-connection	<i>ac</i>	number assigned to an administered connection.	init	none	none
	<i>number</i>		inads		
	<i>print</i>	reports print to SAT printers. Examples: status administered-connection 1 status administered-connection 50 status administered-connection 128 print	craft cust rcust bcms browse		

Output

The following output example is a display of **status administered-connection 3** command.

```
status administered-connection 3                page 1 of 1
ADMINISTERED-CONNECTION STATUS

Connection Number:
    Enabled?
    Originator:
    Destination:
    Connection State:
    Failure Cause:
    Number of Retries:
    Auto Restorable?
```

Field descriptions

Connection Number:	Number assigned to the administered connection.
Enabled?	Is administered connection enabled? (y or n).
Originator:	Extension of originating access/data endpoint.
Destination:	Destination address used to route administered connections.
Connection State:	Current status of the administered connection. (connected, restored, failed, waiting to retry, attempting to restore, attempting to connect, not scheduled, and disabled).

- Failure Cause:** Reason that the administered connection is attempting to connect, to restore, or failed to restore. If the administered connection was scheduled to be active but is disconnected, this field shows the most recent failure reason.
- Number of Retries:** Number of consecutive failed establishment attempts.
- Auto Restorable?** When an administered connection is connected, this field indicates if auto restoration attempts when a failure occurs.

status attendant

This command diagnoses internal software. This command help to locate facilities to which the attendant console communicates.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status attendant	console number	number assigned to an attendant (1–16).	init inads craft cust rcust bcms browse	none	none
	print	Report sent to printer. Examples: status attendant 1 status attendant 2 status attendant 2 print			

Output

The following output example is a display of the **status attendant 1** command.

```
status attendant 1

      ATTENDANT STATUS

Console Number: 1           Service State: in-service/night service
      Port: 01C1106      Maintenance Busy? no
Connected Ports:

Command successfully completed
```

Field descriptions

- Console Number** Number assigned to the attendant (1-16).
- Port** Port location of the attendant (cabinet-carrier-slot-circuit).
- Service State** In-service/idle, in-service/active, out of service, or disconnected.

Usage State	Idle or active.
Maintenance Busy State	Is maintenance testing the object? (y or n)
Connected Ports	Port locations to which the attendant is communicating (cabinet-carrier-slot-circuit).

status audits

This command displays results of Data Relation Audits that are built into the switch. Data Relation Audits check for inconsistencies between selected data items in the switch, and report inconsistencies. Data Relation Audits are useful during development and testing phases of projects to uncover software errors. In the field they help the switch to recover from data corruption before service is interrupted.

This command displays the date and time that the requested interval begins, the number of times that the full sequence of audits executes (audit cycles), and status information about each audit that detected a problem or aborted during the interval. The status information contains:

- The name of the audit
- The number of times that an audit ran and corrected an error
- The number of times that an audit ran and detected an irreparable error
- The number of times that an audit ran and aborted
- The date and time that the audit first detected a problem (only for cumulative)
- The time of the most recent error detected by the audit (only for cumulative).

Audit data information cumulates from the last reboot or the last **clear audits cumulative** command, and for peak hours since the last reboot or the last **clear audits peak-hour** or **clear audits cumulative** commands.

NOTE:

Single process restarts, warm starts, cold 2 restarts, cold 1 restarts, or processor interchanges do not clear this data.

Audits can execute directly using the "test MO" command (for example, **test MO I 8192 p 512 t 0** executes the Station Connections Audits, audit Inames and numbers (pnames) included in the Table Of Audits.) When the "test MO" command executes an audit, report results display on the screen. In general, errors discovered from a demand tests are not logged in the error logs. To be consistent with other error logging, and to avoid confusion, errors that are discovered from a demand test that executes an audit are not displayed.

The screen does not automatically update. It reflects the system at the time of the request.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status audits	peak-hour	Data collected since the last reboot or since the last clear audits cumulative command.	init inads	none	see below
	cumulative	Data for the peak hour since the last reboot or since the last clear audits cumulative or clear audits peak-hour command. Determined by summing Prints report.			
	print schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: status audits cumulative status audits cumulative print status audits cumulative schedule status audits peak-hour status audits peak-hour print status audits peak-hour schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The **clear audits** command affects the data displayed by **status audits cumulative** and **status audits peak-hour**. The **clear audits cumulative** command clears data collected to date, resets the start time kept for that data, and clears peak hour data. The **clear audits peak-hour** command clears data kept for the peak hour so that a new peak hour can be established.

When the **schedule** option is specified, a scheduling form is displays allowing the technician to schedule command execution. Refer to the Report Scheduler and System Printer feature specification [3] for details about the scheduling form.

Output

The following example is a display of the **status audits** command.

```
status audits cumulative
```

AUDIT STATUS INFORMATION

Start Date: 10:00 MON MAR 22 1990 # of Audit Cycles Completed: 25

Audit Name	# Cycles Fixed Data	# Cycles Could Not Fix Data	# Cycles Audit Aborted
HTLK	0	25	0
HU-CALLS	2	0	0
CR-AUDIT	1	0	0
DE-CALLS	1	0	0
CTRK	0	1	0
AT-ADM	1	0	0
CO-ADM	1	0	0
SE-CALLS	0	0	1
PRI-USR (SCH)	1	0	0

Command successfully completed

Audit information displays with one line of data displayed audit that has detected an error or aborted. Audits that did not detected any errors or aborted do not display. The output sorts in descending order, based on the sum of the values in the # Cycles Fixed Data, # Cycles Could Not Fix Data, and # Cycles Audit Aborted fields.

Field descriptions

Start Date	Date and time that interval begins. "cumulative" = date and time of the last reboot or execution of the "clear audits cumulative" command. "peak-hour" = date and time of the beginning of the peak hour since the last reboot or execution of a "clear audits cumulative" or "clear audits peak-hour" command.
# of Audit Cycles Completed	Number of audit cycles completed in the specified interval. (0 – 999999) Asterisks indicate numbers that exceed 999999. The switch executes audits in a set order. After all audits execute, the switch restarts the sequence.  NOTE: Since this field shows the number of completed audit cycles, it is possible that individual audit values, can be larger than the values described below (if the switch is partially through another audit cycle.) Audit Cycles numbers do not apply to these audits that execute as part of scheduled maintenance.
Audit Name	Audit's name that detected an error or aborted. A few audits do not run in the normal audit sequence. Instead, they execute as part of scheduled maintenance and are marked with "(SCH)" following the audit name.
# Cycles Fixed Data	Number of times that the audit ran, in the specified interval, and found a fixable problem. (0–65534) Asterisks are used for numbers that exceed 65534.
# Cycles Could Not Fix Data	Number of times that the audit ran, in the specified interval, and found an unfixable problem. The audited switch data is inconsistent when this happens. (0–65534) Asterisks are used for numbers that exceed 65534.
# Cycles Audit Aborted	Number of times that the audit ran, in the specified interval, and aborted due to an internal error. (0–65534) Asterisks are for numbers that exceed 65534.
First Error	Date and time that the audit first detected fixed data, could not fix data or audit aborted problems since the last "clear audits cumulative" command. Format: MM:DD:hh:mm (for example, 03/27/14:31 for 2:31 pm, March 27th). This field appears with the "status audits cumulative" display.

Most Recent Error

Date and time that the audit last detected fixed data, could not fix data or audit aborted problems since the last "clear audits cumulative" command. Format: MM:DD:hh:mm (for example, 03/27/14:31 for 2:31 pm, March 27th). **This field appears with the "status audits cumulative" display.**

Table of Audits

The following table shows the names of the audits that are run as part of time available maintenance, the audit number (pname) and a short description of each audit. These audits execute using lname MO_DR_AUDIT (8192). These audits may execute using the *test MO* command with lname 8192, pname "audit number," and test number 0 (for example, *test MO / 8192 p 607 t 0* executes the AC state audit).

Audit Name	Audit Number	Description
AC-ISG	607	AC state audit
ADJUSR	595	Adjunct user record audit
ADMTRM	559	Administration terminal audit

SUR-FREE	625	Station User Record Free List Audit

status bri-port

This command displays the service state, maintenance state and layer 1 state of an ISDN-BRI port. This form also displays information about point-to-point signaling links that transport over the port.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status bri-port	<i>location</i> <i>print</i>	Physical location: PCsspp Report sent to printer. Examples: status bri-port 1c0701 status bri-port 1c0701 print	init inads craft cust nms browse	none	none

Output

The following example shows the output from the **status bri-port 1c1701** command.

```
status bri-port 1c1701                               Page 1 of 1  SPE A
                                                    STATUS BRI-PORT
      Port: 01C1701
      Service State: in-service
      Maintenance Busy?: no
      Layer 1 State: activated

      TEI Value  Layer2 State  Endpt Extension  Endpt SPID  Service SPID?
Link1   64      13-established  1010         1010
Link2
Link3
```

Field descriptions

Port:	ISDN-BRI port address.
Service State:	ISDN-BRI port is "in-service" or "out-of-service."
Maintenance Busy?:	specifies if maintenance testing is executing on the ISDN-BRI port ("yes" or "no").
Layer 1 State:	BRI Layer 1 (physical) state on the port. Valid states are "activated," "pend-activation," and "deactivated." <ul style="list-style-type: none">■ "activated" state = layer 1 frames are passing between the port and BRI endpoints.■ "pend-activation" state = the port is in-service, the layer 1 interface device is on, layer 1 frames are sending to the BRI endpoints connected to this port, but BRI endpoints are not responding.■ "deactivated" state = the layer 1 interface device on the BRI is off, because the port goes out-of-service.
TEI Value	Layer 2 addressing parameter used by the switch to exchange information over point-to-point signaling links between BRI endpoints. Each point-to-point signaling link has an associated TEI. This field displays the addressing parameter value. (0–127)

Layer2 State:	<p>Point-to-point signaling link layer 2 state. Valid states are "un-assigned," "assigned," "established," "l3-established" or "hyperactive."</p> <ul style="list-style-type: none">■ "un-assigned" = the link is in TEI-UNASSIGN state at Layer 2.■ "assigned" state = the link is in the AWAIT_EST (Await Establish) state at layer 2. (If BRI endpoints support TEI allocation procedures, they successfully execute and a TEI is assigned to the endpoint by the switch.■ "established" = the link is in the MF_EST_NORM (Multi-Frame Established Normal) state at layer 2. The switch successfully initiates the link can now exchange layer 3 frames with the endpoint. If the endpoint does not support SPID initialization procedures, the endpoint extension associated with the link also displays. This is the normal state for the link in the point-to-point wiring configuration.■ "l3-established" = link is in the MF_EST_NORM state at layer 2 and SPID initialization procedures successfully complete. The endpoint extension associated with the link also displays. This is the normal state for the link in the multi-point wiring configuration.■ "hyperactive" = traffic on this link goes over threshold. The link suspends and is deemed hyperactive.
Endpt Extension	<p>Voice/data endpoint extension associated with the link if the link is in the "established" (point-to-point configuration) or "l3-established" (multipoint configuration) layer 2 state. Otherwise, this field is blank.</p>
Endpt SPID	<p>This field displays the SPID administered on the voice/data endpoint associated with the link. Note that this information is displayed only if the link is in either the "established" (point-to-point configuration) or the "l3-established" (multipoint configuration) layer 2 state. Otherwise this field is blank.</p>
Service SPID	<p>Indicates if the link is associated with the Service SPID. If the link is associated with Service SPIDs, the field contains a "yes" and the endpoint extension field is blank; otherwise, this field is blank. Service SPID checks building wiring between the switch and the BRI endpoint.</p>

Status Interpretation

The following table provides information on the status bri-port form.

Table 8-4. Status BRI-Port Command Interpretation

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
ASAI, BRI	0-126	Assigned	blank	blank	<p>Transitory state for BRI endpoints and ASAI adjuncts. The switch attempts link establishment.</p> <ol style="list-style-type: none"> 1. Check endpoints and wiring by following SPID Facility Test Procedures described in the BRI-SET (ISDN-BRI Set/ASAI Adjunct) Maintenance documentation. 2. Verify repairs by executing the status bri-port PCSSpp command. Determine that L2 state of the signaling link is "L3-Established" for ASAI adjuncts and BRI endpoints supporting MIM (management information messages) initialization, and "Established" for fixed TEIBRI endpoints and automatic TEIBRI endpoints not supporting MIM initialization. <p>⇒ NOTE: A MIM is a level-3 message that conveys management and maintenance information between communications systems and BRI terminals.</p>

Continued on next page

Table 8-4. Status BRI-Port Command Interpretation — Continued

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
ASAI	0-63	Established	blank	blank	<p>Transitory state for ASAI adjuncts. ASAI signaling is connects at Layer 2. Layer 3 Restart procedure does not complete between switch and adjunct.</p> <ol style="list-style-type: none"> 1. Check the adjunct by following the manufacturer's recommended repair procedures. 2. ASAI	0-126	L3-Restarted	ext		After receiving a Restart Acknowledgment message, the switch sends a Heartbeat message to the adjunct and awaits a response.
ASAI	0-126	L3-Established	ext		Normal state for ASAI adjunct.

status card-mem

Memory cards are portable, compact memory cards that contain banks of flash EPROM chips. Non-volatile memory cards are erasable and randomly programmed with user data. Main memory stores system software in its “flash” section. Memory cards that save translations do not contain copies of the system software. During system reboot or system power down conditions, in-core system maintenance hardware error logs temporarily save in memory cards before the

system goes down. Then, the error logs file reads back when the system restarts. The Hard Patch feature also uses the memory card as temporary storage when LMM applies patched files to the system software.

The **status card-mem** command displays the following memory card information located at active or standby SPEs:

- Is a valid memory card in place?
- Is the memory card write-protected?
- What is the capacity of the inserted memory card?
- What kind of system configuration - small or medium?
- What is the number of pulses counted in the last erase operation?
- What is the percentage of translation storage space used?
- What are the names of files stored in the memory card, and what is date and time (if available) when it was saved?

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status card-mem	<i>location</i>	Physical carrier position where the memory card resides in a High or Critical Reliability System Simplex switch configurations=not required. Duplex switch configuration= "A" for control carrier A in Processor Port Network (PPN), or "B" for control carrier B in PPN.	init inads craft cust rcust nms bcms browse	none	see below
	<i>print</i>	Report sent to printer. Examples: status card-mem status card-mem A status card-mem b print			

Feature Interactions

If the Announcement feature is unavailable in the system features configuration, the "Data Present" field is always "n" for the "announcements" file. The Announcement feature requires a memory card with a minimum capacity of 4 MB. If the memory card is less than 4 MB, Announcements cannot be save in the memory card.

Core Dump features require 10 MB memory cards for saving core dumps. If the memory card has a capacity less than 10 MB, the core dump operation fails.

Output

For following output example is a display of the **status card-mem** command.

```
status card-mem

                                MEMORY CARD STATUS

Location: 01A                    Write Protection: off
  Status: inserted                Capacity (MB): 4 Series 1
System Size: Medium              Number of Erase Pulses: 78
                                Translation Storage Space Used (%): 21

File Name      Data Present      Date       Time
translation    y                2/17/91    9:00
announcements  y                2/15/91    20:30

Command successfully completed
```

Field descriptions

- Location** Physical location (carrier) of the memory card. Simplex system = 01A for carrier A of Processor Port Network. High or Critical Reliability Systems = 01A or 01B.
- System Size** System configuration (Small or Medium). This information catches errors such as incorrectly-sized memory card inserted into the system.
- Capacity** Inserted memory card capacity and the series number of the memory card. (a 3-digit format for the memory card size and a 1-digit format for the series number). Three memory card capacities are used in the DEFINITY D92 system. Memory card file contents are described below.

Capacity of Memory Card

Card Size	User	Customer File Names
1 Mb	Small w/o Announcements	translation
4 Mb	Medium w/o Announcements	translation
4 Mb	Small and Medium with Announcements	translation announcements
10 Mb	Maintenance (core dump)	translation announcements core_ dump
10 Mb	System Upgrade	system_software

Field descriptions

Status	<p>“inserted” = valid memory card is in the memory card slot. When the status is “inserted,” the switch can perform I/O operation to the memory card</p> <p>“no card” = no memory card is inserted or the inserted memory card has a bad connection</p> <p>“unformatted”= the inserted memory card is unformatted or the switch cannot recognized it.</p>
Write-Protection	<p>“on” = the write-protection toggle on the memory card is on. “off” = the write-protection toggle on the memory card is off. If the “Write-Protection” field is “on,” the switch cannot store files to the memory card.</p>
Number of Erase Pulses	<p>Number of pulses counted in the last erase operation on a Series 1 memory card. This field is blank for Series 2 memory cards due to different algorithm of erase operations between the two series.</p>
Translation Storage Space Used (%)	<p>Percentage of reserved storage space for storing translation files in the memory card that saves translations to the memory card.</p> <p> NOTE: This percentage is valid for the specific memory card used in the <i>most recent</i> save translation operation (which is implemented with the save translation command or with scheduled maintenance and save translation enabled). If the memory card is replaced with another card, or if no save translation is performed on the new memory card, the percentage does not indicate the translation storage space used in the new card.</p>
File Name	<p>Each formatted memory card has reserved a fixed space in the card for each file. The starting address and size of each reserved slot is pre-determined according to the capacity of the memory card. The file name as defined in Table "Capacity of Memory Card" is shown in this field.</p>
Data Present	<p>The "Data Present" field is "y" when the file contains valid data. Otherwise, the "Data Present" field has a value of "n."</p>
Date Time	<p>This field shows the date and time when the file was saved into the memory card. For the "Software Upgrade" type of memory card, this field contains the system software release number instead of the time stamp. Due to the restriction of "core dump" file format, the year information is not available in the date/time string.</p>

status cdr-link

This command displays the status of call detail recording (CDR) links. Link up or down status displays. If a link is down, the system displays the number of times the switch attempts link setup.

Call detail recording (CDR) links physically link SPEs to a recording device (for example, printer) for sending CDR call records. CDR link are composed of a data channel on the NETCON board or EIA port on the processor circuit pack, a digital port and a data module. Two CDR links can exist in the system.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status cdr-link	<i>print</i>	Report sent to printer. Examples: status cdr-link status cdr-link print	init inads craft cust rcust nms bcms browse	none	none

Output

The following example is a display of the **status cdr-link** command.

```
status cdr-link

                                CDR LINK STATUS

      Primary                      Secondary
Link State: up                    extension not administered
Number of Retries: 0
Maintenance Busy? no
```

Field descriptions

Link State	Up, down, or unadministered extension. “up” = link is up and available to the application. (normal state) “down” = link is physically down. “Extension not administered” = administer system cdr feature form.
Number of Retries	The number of times the switch tries to initialize the link.
Maintenance Busy	“yes” = maintenance object is busied out. “no” = maintenance object is not busied out.

status cleared-alarm-notif

Expert systems use the **status cleared-alarm-notif** command to detect chronic alarming conditions. If this command displays “Feature is suspended”, Expert Systems can identify open trouble tickets as chronic problems for special consideration.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
cleared-alarm-notif	1	First OSS telephone number status of Cleared Alarm Notification.	init inads craft	first OSS telephone number for the Cleared Alarm Notification status.	none
	2	Second OSS telephone number status of Cleared Alarm Notification. Examples: status cleared-alarm-notif status cleared-alarm-notif 1 status cleared alarm-notif 2	cust rcust		

status conference

Technicians use the **status conference** command to solve the following multimedia problems:

1. A user cannot join or remain connected to a conference.
2. Automatic algorithms — audio AUTO mode and the Px64 video picture specifications downgrade the conference, causing poor video quality.
3. A user does not receive full service.
4. An audio add-on user cannot join or remain connected to a conference.
5. A conferee is not seen by other users due to interworking problems.

6. Users cannot participate in Multipoint Communications Service conferences.
7. Continuous conferences do not move endpoints in or out of quadrants.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status conference	status conference	Stored conference data.	init inads craft	conference-ID = all (all stored data).	none
	status conference 2 print	Conference 2 data (current or last completed). Sends report to SAT-linked printer. Examples: status conference status conference 2 print status conference [all \ conference-ID] [print \ schedule] status conference [all \ conference-ID] [endpoint \ endpoint id]			

Output

```

status 50
                                                    Page 1 of 2

It is possible for several records to display. Active conferences display first (in order of conference-ID), followed by completed conferences (most recently completed first). Conferences that have not begun have no data or information.

Conference data displays in 2 parts: the first screen describes the status of the conference and indicates the modes and levels of the conference. It also identifies in-use endpoints that cause conference operating modes to change. This screen is similar to the administration screens. The remainder of the screens display endpoint level data (up to 8 endpoints per screen), revealing ports and drop reasons.

[Screen 8-6](#) shows page 1 of a typical administration screen. The first screen appears when **status conference** is entered and at least 1 valid conference is found.

Field descriptions (status conference, page 1)

status	Current status of the conference (active, in-use, complete)
conference name	(MMCH DYNAMIC)
conference mode	(Voice-activated)
password	Not Applicable
password scope	Not Applicable
cascade mode	Conference cascade mode (blank)
audio mode	Current operating audio mode (G.711-A, G.711-mu, G.728, G.722)
class	Conference type (dedicated)
data mode	Conference data mode capability (none, any-mlp, ww-pcs)
MLP rate	Conference MLP Data Rate (blank).
start time/date	Conference start time in 24-hour notation with month and day.
stop time/date	End of conference in 24-hour notation with month and day. It is the actual end time if Status is complete; otherwise, it is blank.
admin bandwidth	Channel bandwidth administered on the Conference Record form. (64k)
no of channels	Number of channels required for each Px64 endpoint (2)
Chair	Current chair token holder. ()
conf bandwidth	Current operating channel conference bandwidth. Different from the administered bandwidth because of Rate Adaptation.

8 Maintenance Commands and Trouble-Clearing Aids
status conference

8-263

Rate adaptation	Does this conference support Rate Adaptation? (n, y)
Format (in/out)	<p>The video format for single-screen conferences: CIF, QCIF, QCIF/CIF, H.CTS, H.CTX+, and SG4.</p> <p>non-H.261 conferences = input and output formats are always symmetric and the mode is the same for input and output. (H.CTX, H.CTX+, and SG4).</p> <p>H.261 mode non-continuous presence conferences = symmetric format (CIF and QCIF).</p> <p>Non-presentation, continuous presence conference in single-screen = symmetric format (CIF and QCIF).</p> <p>Presentation mode H.261 single screen continuous presence capable conferences = symmetric input and output formats QCIF/CIF (displayed as CIF) or asymmetric QCIF/CIF, if the administered format is upgradeable.</p> <p>For quad-screen conferences = the format is QCIF/CIF to reflect the QCIF input from all participants and output of CIF to all participants.</p> <p>For presentation mode quad-screen conference = the format is QCIF/CIF to reflect the input/output of all participants except the presenter. In quad-screen mode, presenter input is always CIF.</p>
FPS	The CIF frame rate (frames per second) - ' - ', 30, 15, 10, 7.5. FPS indicates the rate that endpoints can receive frames. The MCU cannot detect maximum transmit frame rates or current frame rates. Frame rates change due to the amount of motion in the input image.
QFPS	<p>The ACIF frame rate (frames per second) (' - ', 30, 15, 10, 7.5). The rate that an endpoint can generate/receive frames.</p> <p>Quad-screen VAS conferences = QFPS reflects the highest common QCIF frame rate of all endpoints and the video mixer board rate, that is lower than the rest of the participants. QCIF calculation accounts for the highest common CIF frame rate declared by all conference participants, since the QCIF rate cannot be greater than that of the highest common CIF rate.</p> <p>Quad-screen presentation conferences = QFPS reflects the highest common QCIF frame rate of all participants and the video mixer board rate. QFPS cannot be greater than the CIF frame rate that is announced by the presenter.</p> <p>QFPS field is blank for proprietary modes.</p>
lo/hi interworking	<p>Does this conference support Low Speed/High Speed Interworking?</p> <p>This field defaults to n.</p>

Type	The type of conferee — Audio/Video (P64), Audio Add-on (AUD), Cascade Link (CAS), BONDing Call (BOND), BONDing Cascade Link (BCAS), UCC Controller (UCC), or Dedicated Access (DA). BONDing calls use up to 12 channels to form a single multimedia pipe.
Ext	Administered endpoint extension. ()
Meet-me number	The Meet-Me Number administered for the Meet-Me Extension. ()
Dial Type	<p>“in” = dial-in to join endpoint to conference.</p> <p>“out” = dial-out to join endpoint to conference.</p>
In Use	<p>“y” = the endpoint is in use and is fully-connected on all media in an active conference.</p> <p>“c” = the endpoint is in use and is fully-connected; however, the endpoint has changed conference audio or video capability or conference rate due to rate adaptation. This condition requires analysis of this endpoint’s capabilities and mode fields to identify reduced capability.</p> <p>“e” = the endpoint is in use but has capability problems. The endpoint lacks one of the required capabilities (Vid, Bhl, MLP) to fully participate. For MLP capabilities, see the “T120” field. This condition requires analysis of this endpoint’s capabilities and mode field to identify the missing capability.</p> <p>“f” = the endpoint is in use but not connected to all media. The endpoint declared all required capabilities (channel/video/audio/data) but is not fully connected to all conference media. This endpoint may be connecting, failed to connect, or is not a valid video source. This condition requires analysis of this endpoint’s capabilities and mode fields to identify the problem.</p> <p>“n” = the endpoint disconnected during a conference or unsuccessfully attempted to connect to a conference.</p> <p>“blank” = the field is blank until the first call from or to the endpoint.</p>
Ch1	<p>“y” = the endpoint has the required number of channels.</p> <p>“e” = the endpoint does not declare support for the correct number of channels and cannot participate fully in the conference.</p> <p>“n” = the endpoint declares the correct number of channels, but not all join the conference, due to a network or endpoint problem.</p> <p>“blank” = Audio add-on endpoints set the Ch1 field to blank.</p>

- Aud
- “y” = the endpoint has the required audio capability. Audio add-on endpoints always set the Aud field to y when the endpoint joins the conference.
- “c” = the endpoint is PCM only and it changes the conference video quality by changing the operating audio from G.728 to G.711. If administered audio modes are auto and the administered bandwidth is 112 kbps (56 k/channel) or 128 kbps (64 k/channel), the system initiates with the highest common audio, G.728. When the administered bandwidth is greater than 128 kbps, the system initiates with the highest common bandwidth, 7 kHz.
- “e” = A PCM-only endpoint that could not support the administered audio mode, G.728 (such as a data conference), or G. 278/G.711 endpoint that could not support the administered audio mode, 7 kHz. Such endpoints operate with PCM audio and interwork with current operating audio modes.
- blank = blank until the first call from or to the endpoint.
- Vid
- “y” = the endpoint has the required video capability and should be receiving video if the Chl, Aud, and Dat fields are y.
- “c” = downgraded conference video quality from changing CIF to ACIF or by decreasing the frame rate. The conference video mode defaults to CIF. If QCIF-only endpoints join the conference, the entire conference operates in QCIF, with downgraded video clarity. The conference frame rate is initially set to the highest frame rate that can be reduced by any endpoint. If the conference video mode is not administered with upgrade capability, the video parameters for a conference are “downgraded.” They are not “upgraded” until all endpoints disconnect from the conference.
- “e” = the endpoint does not declare video capability in its cap-set.
- “n” = audio only, not receiving video, due to audio or data problems.
- “blank” = Audio add-on endpoint defaults the Vid field to blank.
- Mlp
- Control Link to the ESM (T.120 stack terminator) status, the endpoint MLP data capability, and the state of the data connection in the T.120 stack. This field defaults to blank, indicating that the Data Mode for the conference is none.
- Gx
- “y” = This endpoint has Still Frame Graphics capability.
- e = This endpoint does not have Still Frame Graphics capability. The conference retains still frame graphics capability when non-compliant endpoints join the conference.
- blank = This endpoint never joined the conference.

Rate Adpt Rate adaptation/Interworking indicator (5, 6, y, c, e, n, blank). 5 and "6" apply to Low Speed/High Speed Interworking. All other values apply to Rate Adaptation.

"5" = 56-kbps (Low Speed) endpoint joins a High Speed (128 kbps or above) conference. This endpoint connects with audio only capability but is not a valid video source and destination.

"6" = 64-kbps (Low Speed) endpoint joins a High Speed (128 kbps or above) conference. This endpoint connects with audio only capability but is not a valid video source and destination.

"y" = Endpoint joins the conference at 64 kbps, but because rate adaptation to 56 kbps is triggered by another endpoint, this endpoint rate adapts to 56 kbps.

"c " = The administered conference bandwidth is 64 kbps. This endpoint joins the conference at 56 kbps. The first 56 kbps endpoint that joins 64 kbps rate adaptable conferences triggers rate adaptation (see `Join Time` below).

"n" = Another endpoint triggers a 64-kbps conference to rate adapt to 56 kbps. This endpoint joins the conference at 64 kbps, but encounters problems in rate adapting to 56 kbps. This endpoint may have audio and may be receiving video, but is not a valid video source.

"blank" Rate adaptation was not triggered by any endpoint. If this endpoint is in use and connected, it joins the conference at the administered bandwidth.

Bond Mode BONDing Mode = blank for calls that are unrelated to bonding.

Ts "t" = The endpoint detects voice energy (talking).

"m" = The endpoint indicates to the MCU that it is muted. It is possible for an endpoint to mute, but not send any indication to the MCU. In this situation the MCU does not display a mute indication.

"M" = UDD/CRCS Agent interface mutes the endpoint's audio. Both the endpoint and the UCC/CRCS Agent must mute the endpoint audio.

"S" = The solo-audio state set by UCC/CRCS Agents mutes the endpoint's audio. While in solo-audio state, new endpoints that join the conference automatically mute.

"blank" = Voice energy (talking) is not detected from the endpoint.

Vs MCU endpoint video state (a, b, B, c, i, r, R, s, S, u, U, v, blank).

Quad-screen conferences = an * appears before the Vs value indicating that an endpoint belongs to the mixed image. # appears before Vs values indicating that an endpoint is set to be in the mixed image (via administration or UCC/CRCS Agent), but instead, Fill video displays in its place. This occurs when videos of an endpoint that are set in a quadrant cannot be used as a video sources, because the endpoint is not joined to the conference, suppresses its video, or has invalid video for its video source. Up to four endpoints may have an * or # before the Vs field value.

Quad-screen conferences in VAS mode = Mixed images broadcast to all endpoints.

Quad-screen conferences in presentation mode = Mixed images are return videos to the presenter.

Vs
(cont'd.) a = Applies to quad-screen conferences. *a indicates that an endpoint belongs to the mixed image and is administered to one of the quadrants, but is not currently connected (Fill image displays).

b = Applies to full-screen conferences. This endpoint's video broadcasts to other sites. This conference is in VAS, broadcast, or presentation mode. Quad-screen VAS conferences are prefix with an * indicating that this endpoint's video belongs to the mixed image. Quad-screen presentation conferences, (b without an asterisk) identify the presenter as the broadcaster.

B = The UCC roll call feature causes the endpoint's video to broadcast to other sites. The UCC roll call feature performs in full-screen mode.

"c" = This endpoint's video broadcasts to other sites. The conference is in chair mode and the chair designates the broadcaster. Chair features perform in full-screen mode.

"i" = The endpoint is not a valid video source. #i represents continuous presence conferences with endpoints that are set in particular quadrants.

"r" = For full-screen conferences, the endpoint's video is the return video to the broadcaster. For continuous presence conference in presentation mode, *r represents a VAS quadrant that belongs to the mixed image.

"R" = The UCC browse feature causes the endpoint's video to return video to the broadcaster. UCC Browse feature perform in full-screen mode.

"s" = The endpoint suppresses this endpoint's video. For continuous presence conference with fixed quadrant participants, #s represents endpoints that are fixed in a particular quadrant.

Vs
 (cont'd)

“S” = UCC/CRCS Agent interface suppresses this endpoint’s video. For continuous presence conference with fixed quadrant participants, #S represents endpoints that are fixed in a particular quadrant S displays when both the endpoint and the UCC/CRCS Agent suppress the endpoint video.

“u” = For full-screen conferences, this endpoint’s video broadcasts to other sites. The conference is in VAS mode and the UCC/CRCS Agent interface designates the broadcaster. For quad-screen conferences, UCC/CRCS Agents designate this endpoint as set in a quadrant. An *u represents endpoints that belong to the quad image, and #U represents disconnected endpoints.

“U” = For quad-screen conferences UCC/CRCS Agents designate quadrants as VAS. *U indicates that this endpoint belongs to the quad image.

“v” This endpoint’s video broadcasts to other sites. The conference is in VAS mode but the endpoint asks to be a broadcaster with the “See-Me” request and is granted a MCV (Multipoint Command Visualize) token. The See-Me feature performs in full-screen mode.

“blank” = The endpoint’s video is not broadcast, return, video, or part of the mixed-image, but it is a valid video source.

1:									
2:									
3:									
4:									
5:									
6:									

Field descriptions (status conference, page 2)

Sum Grp	The VD audio Level 1 (L1) and Level 2 (L2) summer group parts for each assigned group (1-4). Summer parts are assigned only for conferences with over 6 participants. When a conference operates at an audio mode of 7 kHz (administered audio mode is 7 kHz, or auto with the bandwidth greater than 128 kbps), the system allocates "primary" and "secondary" L1 and L2 summer parts. Primary and secondary parts are allocated as adjacent port slots on the same board. Status conferences display primary summer ports. Secondary summer ports are one slot higher than displayed primary summer ports.
Join Time	Time (in 24-hour notation) when the channel joins the conference.
Drop Time	Time (in 24-hour notation) when the channel disconnects. If the first channel has a drop time, the endpoint is inactive. If a drop time exists without a join time, the call disconnects without joining the conference.
Drop Reason	Channel's disconnect because: "2-pri" = Administration errors cause mismatches in primary-secondary designation for cascade linking. This mismatch indicates that both MCUs are administered as primaries (see "Cascading" for a description of primary-secondary compatibility). "2-sec" = Administration errors cause mismatches in primary-secondary designation for a cascade link. This mismatch indicates that both MCUs are administered as secondaries (see "Cascading" for a description of primary-secondary compatibility). "Agent" = The reservation agent causes the call to disconnect. "Bandwidth" = A mismatch occurs between a call and the conference it attempts to join. "BondHshake" = Information channel parameters are unsupported or invalid, parameter negotiations terminate out of sequence, timers expire because secondary channels do not establish, or BONDing framing is undetected for one of the other channels. "Busy" = MCU detects that the conferee's terminal equipment is busy. This drop reason is detected by ISDN cause values (for example h0). See "Dial-out" for a description of CPTR usage. "Chair" = Chair Command Disconnect (CCD) or Chair Command Kill (CCK) signals disconnects the endpoint. "Conf End" = The conference ends when it reaches the stop time for a reserved conference or an active conference converts to file.

Drop Reason
(cont'd)

Endpoint Clearing received from DS1. The endpoint causes the disconnect. The endpoint notifies the MCU that it intends to disconnect.

Far-end Clearing received from DS1. The network or endpoint cause the disconnect.

“Handshake” = Framing is not located or is lost for over 40 seconds and the endpoint disconnects. (The endpoint cannot complete initialization due to problems with finding Frame Alignment Signal (FAS), Multi Frame Alignment (MFA) and getting a corrected coded cap-set.)

“IDtimeout” = The H.320 sends three unsuccessful responses to the MCU regarding the UIN/password Query. Timeout periods exist for each period.

“Internal” = MCU cannot allocate the necessary trunk resources to route the dial-out call for the specified dial-numbers. This problem can be associated with routing patterns or trunk associated translations, or it can indicate insufficient trunk resources.

“Network” = Clearing received from DS1. The network causes the disconnect. The endpoint with disconnect notification capability disconnects without notifying the MCU.

“Not-MCU” = The dial-out destination number(s) of the “CAS” extension terminates to a number that is not a dial-in cascade MCU extension.

“No-ring” = Calls are up for 30 seconds without ringing.

“Reorder” = The MCU CPTR resources detects that no network trunks are available to place the call. See “Dial-out” for a description of CPTR usage.

Drop Reason <i>(cont'd)</i>	<p>“Pre-AnsDrop” = The call disconnects before an endpoint answers. The network, an endpoint, or a terminal adapter may cause the disconnect. This drop reason differs from ‘No-answer,’ which indicates that a 60-second timeout occurs during alerting. In this case, the call drops before the 60-second timer expires. Some busy endpoints connected through terminal adapters display this behavior.</p> <p>“Resource” = MCU cannot provide resources (VC or MMI) when the call arrives or loses the resources during the call. This can occur when they are Out of Service, busied out by craft, or in use by system maintenance. This drop reason can also occur if the DS1/MMI cable disconnects. If a resource problem exists when the call arrives, it gets a reorder (fast busy) and the MCU does not disconnect it.</p> <p>“Password” = The user entered a wrong password or the audio add-on user did not enter it within the specified time period. The audio add-on user has one attempt to enter a correct password and has about 10 seconds between digits (inter-digit timing).</p> <p>“System” = MCU restarts (level 2) disconnect all calls.</p> <p>“UIN-Inv” The user enters an invalid User Identification Number.</p> <p>“Unknown” = The system cannot determine the disconnect cause.</p> <p>“Wrong Num” The MCPTR resources SDN cause value detects an incorrectly-dialed destination number. See “Dial-out” for details.</p> <p>“UCC” = The controller intentionally disconnects the endpoint.</p>
AC Num	Administered Connection Number. (1–128) AC numbers further diagnose problems by combining status conference information with the status administered connection command, and data stored in error and alarm logs.
Ports Trunk	The data endpoint used by the channel.
Ports Video	The MMI port for the channel.
Ports Aud	If the endpoint type is not “UCC,” the VC audio encoder port (which is always paired to a decoder port) for the channel (only the first channel). appears together with the ESM data port in the endpoint’s channel 1 port slot position of the <code>Port Aud/ESM</code> column. For “UCC” endpoints, channel 1 port slot positions display allocated Call Classifier resources.
Ports ESM	Expansion Service Module MMI data port. This field defaults to blank.
Sum Grp	Endpoint’s assigned summer group number. The summer group port assignments are on screen 1.
software	For Lucent Technologies use only.

Field descriptions (status conference endpoint)

The **status conference x endpoint y** command specifies that the conference is found. Data relevant for each endpoint displays in 6 pages. If technicians use the endpoint-ID **all**, every specified endpoint displays.

Page 1 - Status Conference Endpoint

Screen 8-8. Page 1 of 6: status conference x endpoint y

Field descriptions

Endpoint	Slot number associated with the endpoint on the conference forms.
Product	Product identification number obtained from the endpoint.
Manufacturer/ Country	Manufacturer identification number and manufacturer's country code obtained from the endpoint.
Terminal Name	Blank.
Sum Grp	Endpoints belong to this Summer group number and the VC Audio Level (L1) and Level 2 (L2) summer ports for this group. These fields supply entries for conferences with over 6 participants.
Dial Out #1	Blank
Dial Out #2	Blank

In Use	<p>Is the endpoint participating in the conference or connecting to the conference? - <i>y</i>, <i>c</i>, <i>e</i>, <i>f</i>, <i>n</i>, <i>blank</i>.</p> <p>“<i>y</i>” = The endpoint is in use and fully-connected on all media in an active conference.</p> <p>“<i>c</i>” = The endpoint is in use and fully-connected; however, the endpoint changes the conference audio or video capability, or the rate of the conference due to rate adaptation. This condition requires analysis of this endpoint’s capabilities and mode fields to identify the reduced capability.</p> <p>“<i>e</i>” = The endpoint active, but has capability problems. The endpoint lacks one of the required capabilities (Vid, Bhl, MLP) to be a full participant. For MLP capabilities, see the “T120” field. This condition requires analysis of this endpoint’s capabilities and mode field to identify the missing capability.</p> <p>“<i>f</i>” = The endpoint is active, but is not connected to all media. The endpoint declared all required capabilities (channel/video/audio/data) but is not fully-connected to all conference media. This endpoint may be connecting, failed to connect, or is not a valid video source. This condition requires analysis of this endpoint’s capabilities and mode fields to identify the problem.</p> <p>“<i>n</i>” = The endpoint connects then disconnects in a conference, or unsuccessfully attempts to connect to a conference.</p> <p>“<i>blank</i>” = Blank until the first call is made from or to the endpoint.</p>
Enh BAS	<p>Enhanced Basic Service Flag - <i>n</i>, <i>y</i></p> <p>“<i>y</i>” = The endpoint supports the enhanced BAS commands/caps; “<i>n</i>” = The endpoint supports the basic BAS commands/caps.</p>
Ch1	<p>Data on the quantify and quality of channels (transfer rate)? - <i>y</i>, <i>e</i>, <i>n</i>, <i>blank</i></p> <p>“<i>y</i>” = The endpoint has the required number of channels.</p> <p>“<i>e</i>” = The endpoint does not declare support for the correct number of channels and cannot participate fully in the conference.</p> <p>“<i>n</i>” = The endpoint declares the correct number of channels, but not all channels join the conference, due to network or endpoint problems.</p> <p>“<i>blank</i>” = Audio add-on endpoints set the <i>Ch1</i> field to <i>blank</i>.</p>

Aud	<p>Does it have the required audio capability? - <i>y</i>, <i>c</i>, <i>e</i>, <i>blank</i></p> <p>“<i>y</i>” = The endpoint has the required audio capability. Audio add-on endpoints set the Aud field <i>y</i> when the endpoint joins the conference.</p> <p>“<i>c</i>” = This PCM-only endpoint changes conference video quality by changing the operating audio from G.728 to G.711. If the administered audio mode is auto and the administered bandwidth is 112 kbps (56 k/channel) or 128 kbps (64 k/channel), the system begins with the highest common audio, G.728. When the administered bandwidth is greater than 128 kbps, the system begins with the highest common bandwidth, 7 kHz.</p> <p>“<i>e</i>” = A PCM-only endpoint that could not support the administered audio mode, G.728 (such as a data conference), or G. 278/G.711 endpoint that could not support the administered audio mode, 7 kHz. Such endpoints operate with PCM audio and interwork with operating audio modes.</p> <p>“<i>blank</i>” = Blank until the first call is made from or to the endpoint.</p>
Vid	<p>Does it have required video capability and is it receiving video? - <i>y</i>, <i>c</i>, <i>e</i>, <i>n</i>, <i>blank</i></p> <p>“<i>y</i>” = The endpoint has the required video capability and receives video if the Chl, Aud, and Dat fields are <i>y</i>.</p> <p>“<i>c</i>” = The endpoint downgrades the conference’s video quality from CIF to ACIF, or by decreasing the frame rate. The conference video mode defaults to CIF, and if a QCIF-only endpoint joins the conference, the entire conference operates in QCIF, with downgraded video clarity. The conference frame rate is initially set to the highest frame rate that can be reduced by any endpoint. If the conference video mode is not administered with upgrade capability, the video parameters for a conference downgrade. They do not upgraded until all endpoints disconnect from the conference.</p> <p>“<i>e</i>” = The endpoint does not declare video capability in its cap-set.</p> <p>“<i>n</i>” = Audio only, not receiving video, due to an audio or data problem.</p> <p>“<i>blank</i>” = Audio add-on endpoints set the Vid field to <i>blank</i>.</p>
MLP	<p>The relationship between the Control Link and the ESM (T.120 stack terminator), the endpoint MLP data capability, and the state of the data connection in the T.120 stack. This field defaults to <i>blank</i>, indicating that the Data Mode for the conference is <i>none</i>.</p>
Gx	<p>“<i>y</i>” This endpoint has Still Frame Graphics capability.</p> <p>“<i>e</i>” = This endpoint did not have Still Frame Graphics capability. The conference retains still frame graphics capability when a non-compliant endpoint joins the conference.</p> <p>“<i>blank</i>” = This endpoint never joins the conference.</p>

Rate Adpt	<p>Rate adaptation/Interworking indicator = 5, 6, y, c, e, n, blank. 5 and 6 apply to Low Speed/High Speed Interworking. All other values apply to Rate Adaptation.</p> <p>“5” = 56-kbps (Low Speed) endpoints join High Speed (128 kbps or above) conferences. This endpoint connects with audio only capability, but is not a valid video source and destination.</p> <p>“6” = 64-kbps (Low Speed) endpoints join High Speed (128 kbps or above) conferences. This endpoint connects with audio only capability, but is not a valid video source and destination.</p> <p>“y” = This endpoint joins the conference at 64 kbps, but because another endpoint triggers rate adaptation to 56 kbps, this endpoint rate adapts to 56 kbps.</p> <p>“c” = 64 kbps endpoints join the conference at 56 kbps. The first 56 kbps endpoint that joins 64 kbps rate adaptable conferences triggers rate adaptation (see Join Time below).</p> <p>“n” = Another endpoint triggers a 64-kbps conferences to rate adapt to 56 kbps. This endpoint joins the conference at 64 kbps, but encounters problems with rate adapting to 56 kbps. This endpoint may have audio and may be receiving video, but is not a valid video source.</p> <p>“blank” = No endpoint triggers rate adaptation. If this endpoint is active, it joins the conference at the administered bandwidth.</p>
Bond Mode	<p>BONDing Mode - blank. This field is blank for calls that are not related to bonding.</p>
Ts	<p>The talking state of the endpoint - t, m, M, S, blank.</p> <p>“t” = The endpoint detects voice energy (talking).</p> <p>“m” = The endpoint indicates that it is muted to the MCU. Endpoints may mute, but not send an indication to the MCU.</p> <p>“M” = UDD/CRCS Agent interface mutes the endpoint’s audio. M displays when both the endpoint and the UCC/CRCS Agent mute the endpoint audio.</p> <p>“S” = the solo-audio state set by UCC/CRCS Agent mutes the endpoint’s audio. While in solo-audio state, new endpoints joining the conference automatically mute.</p> <p>“blank” = The endpoint does not detect voice energy (talking).</p>

Vs

The MCU video state for this endpoint. a, b, B, c, i, r, R, s, S, u, U, v, blank.

Quad-screen conferences = * appears before V values indicating that an endpoint belongs to the mixed image. A # appears before the V values indicating that an endpoint belongs to the mixed image (by administration or UCC/CRCS Agent). Instead, a Fill video displays in its place. This occurs when an endpoint's video that is set in a quadrant cannot be used as a video source because the endpoint is not connected to the conference, suppresses its video, or has invalid video for its video source. Up to four endpoints have an * or # before the Vs field value.

Quad-screen conference in VAS mode = The mixed image broadcasts to all endpoints. For quad-screen conference in presentation mode, the mixed image is return video to the presenter.

"a" = This value applies to quad-screen conferences. *a indicates that an endpoint belongs to the current mixed image and is administered to one of the quadrants. *_a indicates that the endpoint is fixed in a quadrant, but is not currently connected (Fill image displays).

"b" = For full-screen conferences, this endpoint's video broadcasts to other sites. This conference is in VAS, broadcast, or presentation mode. For quad-screen VAS conference are prefixed an asterisk indicating that this endpoint's video is part of the mixed image because of VAS. For quad-screen presentation conferences, b identifies the presenter as the broadcaster.

"B" = The UCC roll call feature causes the endpoint's video to broadcast to other sites. The UCC roll call feature performs in full-screen mode.

"c" = This endpoint's video broadcasts to other sites. The conference was in chair mode and the chair designates the broadcaster. Chair features perform in full-screen mode.

Vs
(cont'd.)

“i” = The endpoint is not a valid video source. For continuous presence conference, #i represents endpoints that are fixed in a particular quadrant.

“r” For full-screen conferences, the endpoint’s video is the return video to the broadcaster. For continuous presence conferences in presentation mode, *r represents a VAS quadrant that is part of the mixed image.

“R” = The UCC browse feature causes the endpoint’s video to be the return video to the broadcaster. UCC Browse feature performs in full-screen mode.

“s” = The endpoint suppresses its video. For continuous presence conferences with fixed quadrant participants, #s represents an endpoint that is fixed in a particular quadrant.

“S” = UCC/CRCS Agent interface suppresses the endpoint’s video. For continuous presence conference with fixed quadrant participants, #s represents an endpoint that is fixed in a particular quadrant. s displays when both the endpoint and the UCC/CRCS Agent suppress the endpoint video.

“u” = For full-screen conferences, this endpoint’s video broadcasts to other sites. The conference is in VAS mode and the UCC/CRCS Agent interface designates the broadcaster. For quad-screen conferences, the UCC/CRCS Agent designates this endpoint as fixed in a quadrant. *u represents an endpoint that is part of the quad image, and #u represents a disconnected endpoint.

“U” = For quad-screen conferences, UCC/CRCS Agents designate a quadrant as VAS. *U indicates that this endpoint is part of the current quad image.

“v” = This endpoint’s video broadcasts to other sites. The conference was in VAS mode, but the endpoint asks to be a broadcaster with the “See-Me” request and is granted a MCV (Multipoint Command Visualize) token. The See-Me feature performs in full-screen mode.

“blank” = The endpoint’s video is not broadcast, return, video, or part of the mixed-image, but it is a valid video source.

Screen 8-9. Page 2 of 6: status conference x endpoint y

Field descriptions

- Join Time Time (in 24-hour notation) when the channel joins the conference.
- Drop Time Time (in 24-hour notation) when the channel disconnects. If the first channel has a drop time, the endpoint is inactive. If a drop time occurs without a join time, the call disconnects without joining the conference.

Drop Reason

Channels disconnect because:

“2-pri” = Administration errors cause mismatches in primary-secondary designations for cascade links. This mismatch indicates that both MCUs are administered as primaries (see “Cascading” for a description of primary-secondary compatibility).

“2-sec” = Administration errors cause mismatches in primary-secondary designations for cascade links. This mismatch shows that both MCUs are administered as secondaries (see “Cascading” for a description of primary-secondary compatibility).

“Agent” = Reservation agents cause calls to disconnect (for example, agents change connected dial-out destination numbers).

“Bandwidth” = Mismatches occur when bandwidths of calls and the conferences they attempt to join are inconsistent.

“BondHshake” = Unsupported Information channel parameters or invalid, parameter negotiations that terminate out of sequence, timers that expire because secondary channels do not establish, or BONDing framing that goes undetected for another channels.

“Busy” = The MCU detects that the conferee’s terminal equipment is busy. An ISDN cause value detects this drop reason (for example h0). See “Dial-out” for a description of CPTR usage.

“Chair” = Chair Command Disconnect (CCD) or Chair Command Kill (CCK) signals disconnect the endpoint.

“Conf End” = The conference ends when the stop time is reached for a reserved conference or an active conference converts to file.

Drop Reason
(cont'd)

“Endpoint” = Clearing received from DS1. The endpoint initiates the disconnect. The endpoint notifies the MCU that it intends to disconnect.

“Far-end” = Clearing received from DS1. The network or endpoint initiate the disconnect.

“Handshake” = Framing is never found or is lost for over 40 seconds and the endpoint is disconnected. (the endpoint could not complete initialization due to problems with finding Frame Alignment Signal (FAS), Multi Frame Alignment (MFA) and corrected coded cap-sets)

“IDtimeout” = The H3.20 user unsuccessfully (three times) sends MCU responses regarding the UIN/password Query. Each timeout period is administered.

“Internal” = MCU has a problem allocating the necessary trunk resources to route dial-out calls for specified dial-numbers. This problem is associated with routing patterns or trunk-associated translation (for example, TAC specified in the dial-out number or routing pattern points to a trunk group without members), or indicates a lack of trunk resources (for example, all trunk members are maintenance busy or all in-service members are busy on a call).

“Network” = Clearing received from DS1. The disconnects the endpoint. The endpoint with the disconnect notification capability disconnects without notifying the MCU.

“Not-MCU” = The dial-out destination numbers of the “CAS” extensions terminate to numbers that are not dial-in cascade MCU extensions.

“No-ring” = The is up for 30 seconds and no ringing is detected.

“Reorder” The MCU CPTR resources detect that no network trunks are available to place the call. See “Dial-out” for a description of CPTR usage.

Drop Reason <i>(cont'd)</i>	<p>“Pre-AnsDrop” = The call disconnects an endpoint answers. The network, an endpoint, or a terminal adapter may cause the disconnect. This drop reason differs from ‘No-answer,’ which indicates that a 60-second timeout occurs during alerting. In this case, the call drops before the 60-second timer expires. Some busy endpoints that are connected through terminal adapters display this behavior.</p> <p>“Resource” = MCU cannot provide resources (VC or MMI) when calls arrive or lose their resources during the call. Calls can lose resources when they are Out of Service, busied out by craft, or in use by system maintenance. If the DS1/MMI cable is disconnected, this drop reason can also occur. If a resource problem exists when the call arrives, it gets reorder (fast busy) and is not disconnected by the MCU.</p> <p>“Password” = The user enters a wrong password or the audio add-on user does not enter it within the specified time period. The audio add-on user gets one attempt to enter a correct password and has about 10 seconds between digits (inter-digit timing).</p> <p>“System” = MCU restarts (level 2) disconnect all calls.</p> <p>“UIN-Inv” = Users enter invalid User Identification Numbers.</p> <p>“Unknown” = The system cannot determine the disconnect cause.</p> <p>“Wrong-num” = The MCU CPTR resources SDN cause values detect an incorrectly-dialed destination number. See “Dial-out” for details.</p> <p>“UCC” = The controller intentionally disconnects the endpoint.</p>
Drop Code	A detail code complementing the Drop Reason. Additional bonding-related information is available from the supplementary BONDing Drop Codes described above.
AC Num	Administered Connection Numbers. (1–128) AC numbers can further diagnose problems by combining status conference information with the status administered connection command, and data stored in the error and alarm logs.
Ports Trunk	The data endpoint that the channel is using.
Ports Video	The MMI port for the channel.
Ports Aud	If the endpoint type is not “UCC,” the VC audio encoder port (which is always paired to a decoder port) for the channel (only the first channel). appears together with the ESM data port in the endpoint’s channel 1 port slot position of the <code>Port Aud/ESM</code> column. For “UCC” endpoints, the channel 1 port slot position displays allocated Call Classifier resources.
Ports ESM	Expansion Service Module MMI data port. This field is always blank.
Ports BONDng	The MMI port used for channel BONDing.
Fr Err	Frame error counter. A circular hex counter (0-FF) to indicates framing error occurrences.

Page 3 - Conference Information

Screen 8-10. Page 3 of 6: status conference x endpoint y

Conference Info. This information primarily applies to full-screen conferences. The Broadcaster field applies to quad-screen presentation mode conferences.

Field descriptions

- Broadcaster** The current broadcaster endpoint number. The following keywords qualify the broadcaster:
- “Broadcast” = A broadcast mode broadcaster.
 - “Chair” = The chair designates the broadcaster.
 - “See-Me” = The endpoint initiates a MCV broadcaster request.
 - “Presenter” = A presentation mode broadcaster.
 - “Rollcall” = The UCC designates the broadcaster by the Rollcall feature.
 - “UCC” = The UCC designates the broadcaster.
 - “VAS” = A Voice Activated Switching broadcaster.

Next Broadcaster	The endpoint number that is selected to be the next broadcaster.
Return Vid	The endpoint number that is the current return video. The return video is qualified with the following keywords: “blank” = VAS, Chair action, UCC action, or endpoint MCV requests force the previous broadcaster to be the return video. The broadcaster qualifier identifies the action that forced this endpoint to become return video. “Autoscan” = Auto scan return video, when conference mode broadcasts with auto scan. “Browse” = The UCC designates the return video with the Browse feature. “VAS” = A Voice Activated Switching return video.
Next Return Vid	Indicates the endpoint number selected to be the next return video.

Mode Commands/Communication Modes. This is a collection of incoming and outgoing bandwidth allocations for the multiplex. The Incoming data is the rate at which the MCU thinks the endpoint is communicating based on the Bit-rate Allocation Signal (BAS) codes received from the endpoint/codec and the capabilities the MCU has declared. The Outgoing data is the rate from the MCU toward the endpoint. The following are column definitions for this section of page 3.

Field descriptions

CONF	The desired conference operating mode. This may differ from the endpoint in (EPT-IN) or endpoint out (EPT-OUT) modes.
CMD	Labels for the various types of mode commands
STAT	Conference and incoming mode compatibility. “y” = mode compatibility “n” = modes incompatibility.
EPT-IN	defines the communication modes coming in from an endpoint.
EPT-OUT	Defines the communication modes sent to an endpoint based on the number of connected channels and the endpoint’s capabilities.

The following are field definitions for the Mode Commands/Communication Modes section of Page 3.

XRATE	One of the supported rates in Table 8-5 :
-------	---

Table 8-5. Supported Transfer Rates s

XRATE	Bandwidth of the Call
2x64	2B (2x56 or 2x64)
128	112kbps or 128kbps
196	168kbps or 196kbps
256	224kbps or 256kbps
320	280kbps or 320kbps
384	336kbps or 384kbps
512	512kbps
768	768kbps
1472	1472kbps
1536	1536kbps'
1920	1920kbps

Field descriptions

XRATE
(cont'd.)

XRATE may be 64 when the endpoint dials in, or in the event that problems occur. It implies that only one B channel is in use.

AUDIO

Conference and endpoint Audio rates (kbps bandwidth) must be the same. Their modes are not necessarily the same. When the audio rate of the conference and the endpoint differ, the endpoint's audio interworks, but the endpoint's video is invalid. MCU may or may not send video to such an endpoint.

[Table 8-6](#) summarizes expected endpoint audio modes with different transfer rate configurations, facility bandwidths, and conference modes. It includes endpoints that support the highest common audio mode (HC audio) when the administered mode is `auto`. The highest common conference mode depends on the administered bandwidth. A '-' in the table indicates 'does not apply.'

Table 8-6. Audio Mode Configurations

Admin Mode (HC Audio)	All Support HC Audio	Xfer Rate	Facility BW	Conf Mode	Expected Endpoint Mode
auto (G.728)	yes	<=128k	-	G.728	G.728
auto (G.728)	no	<=128k	64k	G.711-A-56k	G.711-A-56k B.711-Mu-56k
auto (G.728)	no	<=128k	56k	G.711-A-48k	G.711-A-48k G.711-MU-48k
auto (G.722)	-	>128k	64k	G.722-56k	G.722-56k G.711-A-56k G.711-Mu-56k
auto (G.722)	-	>128k	56k	G.722-48k	G.722-48k G.711-A-48k G.711-Mu-48k
G.728	-	-		G.728	G.728
G.711	-	-	64k	G.711-A-56k	G.711-A-56k G.711-Mu-56k
G.711	-	-	56k	G.711-A-48k	G.711-A-48k G.711-Mu-48k
G.722	-	-	64k	G.722-56k	G.722-56k G.711-A-56k G.711-mu-56k
G.722	-	-	56k	G.722-48k	G.722-48k G.711-A-48k G.711-Mu-48k

Field Descriptions

AUDIO
(cont'd.) Other possible AUDIO mode values include *neutral* (neutralized I-channel), *Au-off*, and *Frm* (no audio signal) which never match conference modes and are unsupported by MCU.

56/64 The *65/64* field *derestricts* when operating at 64kbps, 128kbps, 192kbps, 256kbps, 320kbps, 384kbps, 512kbps, 768 kbps, 1472kbps, 1536kbps, or 1920kbps per channel speeds; it *restricts* when operating at 56kbps, 112kbps, 168kbps, 224kbps, 280kbps, 336kbps, 448kbps, and 672kbps per channel speeds.

If technicians configure the conference for Nx56kbs operations, endpoint may signal by capabilities or modes that operate at the proper rate. In such a case, when technicians receive *derestrict* commands while they are in the *restrict* mode, that do not match conference communication modes, (MISC capability has *restrict* displayed on Page 4) the *STAT 56/64* is *y* indicating 56/64 compatibility between the conference and the endpoint.

VIDEO The Video mode: *H.261* (recommended), *H.CTX* (proprietary), *H.CTX+* (proprietary), or *SG4* (proprietary) indicate that video is on in the direction indicated; and *video-off* when the video is off.

MLP	Multi Layer Protocol data mode. When technicians administer Data Modes as <code>any-mlp</code> or <code>ww-pcs</code> , MLP modes should be <code>var-MLP</code> . Other values affect video status. MLP modes should be <code>MLP-off</code> when technicians administer Data Modes as <code>none</code> . Other values in this mode affect video status.
H_MLP	The High Speed MLP mode. The HMLP mode should be <code>H-MLP-off</code> . Other values in this mode affect video status.
LSD	Low Speed Data mode. The LSD mode should be <code>LSD-off</code> . Other values in this mode affect video status.
HSD	High Speed Data mode. The HSD mode should be <code>HSD-off</code> . Other values in this mode affect video status.
CRYPT	Encryption mode. The CRYPT mode should be <code>encrypt-off</code> . Other values in this mode affect video status.
S/M	Single/Multi channel interoperability mode. <code>6B-H0-comp</code> indicates that the sender is interoperating multiple channels and a single channel (for example, 6B and H0). <code>Not-comp-6B-H0</code> indicates that the sender is not interoperating between 6B and H0. Normally this value is <code>Not-comp-6B-H0</code> . Other values in this mode affect video status.

Endpoint Miscellaneous (EPT MISC) Information. EPT MISC contains miscellaneous states and counters for an endpoint. Flags can `y` or `n`. Counters start with 0x00, increment to 0xff, and wrap around to 0x01. `AIM` and `VIS` are BAS commands that can be sent as input to MCU from an endpoint or as output from MCU to an endpoint

Field descriptions

AIM	Audio Indicate Mutes. “y” = For input, this endpoint mutes its audio. MCU does not VAS to an endpoint displaying mute. For output, all other endpoints in the conference mute their audio (have sent AIM to MCU). MCU in turn tells this endpoint (by sending it AIM) that there is no audio output from MCU. “n” = For input, this endpoint does not mute (only if endpoint audio mode is turned on). For output, an audio path opens across the bridge.
VIS	Video Indicate Suppressed. “y” = For input, this endpoint suppresses its video (video is muted). For output, the MCU is not sending video to this endpoint because there is no video broadcaster (broadcaster does not join or broadcaster’s video is invalid).

MIS	Multipoint Indicate Secondary-status. “n” = For output, the endpoint is a valid source (not necessarily at this moment). n is the correct state for the video. “y” = MIS was sent to an endpoint considered to be a secondary endpoint. The endpoint is included in the audio, but not video portion of the conference. Video is not sent.
MCV	Multipoint Command Visualize. “y” = For input, an endpoint requests to become a broadcaster. This is used during Still Frame Graphics and to force “presentation” mode.
TALK	“y” = The VC board detects voice energy from the endpoint. The TALK counter indicates the number of starts or stops.
VRCV	“y” = The endpoint is receiving video (MCU is sending video to the endpoint). The VRCV counter counts the number of times video sends or does not send to this endpoint.
BCTK	Single screen and quad-screen presentation mode conferences. “y” = The endpoint is the video broadcast source. The BCTK counter tallies the number of times this endpoint is the video broadcast source.
RTTK	Single screen conferences. “y” = The endpoint is the return video source. The RTTK counter tallies the number of times this endpoint is the return video source.
BCLS	Single and quad-screen presentation mode conferences. “y” = The endpoint is watching the video of the broadcast source.
RTLS	Single screen conferences. “y” = The endpoint is watching the video of the return source.
HYPR	“y” = Endpoint hyperactivity (MCU isolates endpoints from the MMCH conference due to “thrashing” behavior) affects the endpoint’s status as a video source (for 5 seconds of hyperactivity timer). The HYPR counter tallies the number of times this endpoint is hyperactive.
DMUTE	“y” = The VC board or the software in the MCU mute the decoder. VC boards mutes the decoder when it loses MMI or endpoint framing, when it receives invalid audio code words, and when endpoints are hyperactive. MCU software mutes the endpoint decoder of all endpoints besides the broadcaster. (when a mode of a conference is “broadcastw/scan” ,broadcast with auto scan) The DMUTE counter tallies the number of times the VC board mutes this endpoint’s decoder.
VFMT	Quad-screen conferences. This field always defaults to n, indicating QCIF format.
H.261	“y” = Video framing loss. The H.261 counter tallies the number of times framing is lost.

Frame Alignment Word (FAW) Information. The FAW section of page 3 provides channel Frame Alignment Word information for the communication

paths labeled CHL 1 and 2. For 2B calls, both CHL 1 and 2 are used. For 1-channel calls (112, kbps, 128 kbps, 168 kbps, 196 kbps, 224 kbps, 256 kbps, 280 kbps, 320 kbps, 336 kbps, 384 kbps, 768 kbps, 1472 kbps, 1536 kbps, and 1920 kbps) only CHL 1 is used. A-OUT, A-IN, M-FRM, MFA, and MFN are flags with y or n.

Field descriptions

A-OUT	MCU has endpoint framing.
A-IN	Endpoint has MCU framing
M-FRM	Multichannel frame alignment of both channels in 2B is present.
MFA	Multiframe alignment word is present (required in 2B call).
MFN	Multiframe numbering is present (required in 2B call).
FAS	Frame Alignment Signal (FAS) channel number (1 or 2). This number should match the column header.
MCUFAL	MCU Frame Alignment Loss (MCUFAL). Counts the number of times the MCU reports lost endpoint FAW or multichannel synchronization (M-FRM) to the endpoint. The MCU a-bit toggles when the MCU gains or loses endpoint multichannel synchronization. This counter starts with 0x00, increments to 0xff, then wraps around to 0x01. The MCUFAL count also displays in the <code>Fr Err</code> field on Page 2
FEFAL	Far End Frame Alignment Loss (FEFAL). Counts of the number of changes the MCU detects in the endpoint's a-bit (A-OUT). The endpoint a-bit toggles when an endpoint gains or loses MCU framing. This counter starts with 0x00, increments to 0xff, then wraps around to 0x01.

Page 4 - Endpoint Capability Information

This section describes fields specific to endpoint-level command output.

```

status conference endpoint                                     page 4 of 6

Screen 8-11. Page 4 of 6: status conference x endpoint y

Endpoint Capability Information. Fields on this page display if an endpoint declares specific capability. For example, if an endpoint does not declare VID H.CTX capability, the H.CTX field does not display.

Field descriptions

VID	<p>Video and frame rate types that the endpoint supports.</p> <p>"vfmt" = Does not display if the endpoint has no video capability. All values are blank if an active call or audio-only endpoint exists. Otherwise, values for this field include:</p> <ul style="list-style-type: none">■ FCIF for full CIF■ QCIF for quarter CIF. CIF support implies QCIF support. For larger screens, CIF typically displays sharper resolution video, ZCIF is blocked, but may run at higher frame rates with less clarity. Differences are less observable on very small displays.■ cfps and qfps are maximum frame rates (frames/second) that the endpoint can receive video for CIF and QCIF operating modes. CIF frame rate values are 30fps, 15fps, 10fps, and 7.4fps. If the endpoint does not support CIF (that is, the vfmt field is QCIF), the cfps value should be blank.■ da_sfg indicates support for H.261 Still Frame Graphics transfers.■ H. CTX, H. CTX+ and SG4 are proprietary video format capabilities.■ SG4_sfg indicates support for SG4 Still Frame Graphics
MISC	<p>The restrict field and the 56/64 command mode with a restrict value indicate that endpoints operate at 56 kbps per channel. Endpoints on 56 kbps conferences must send one or both 2 indications that they are operating at 56 kbps before they become a video source in a 56 kbps conference. If they signal that they are operating at 56 kbps in a 64 kbps or 384 kbps conference, they become an audio-only source, but the MCU continues to send Selected Communication Mode (SCM) toward them when possible.</p> <p>A MISC capability of derestrict and a 56/64 command of derestrict together indicate that an endpoint operates at 64 kbps. If either is restrict, the conference operates at 56 kbps. Other field values include:</p> <ul style="list-style-type: none">■ dcomp indicates support for WorldWorx PCS data compliance.■ mbe indicates support for Multi Byte Extension. MBE exchanges passwords, terminal names, and other special capabilities, such as, WorldWorx PCS specific features support.■ cic (Chair Indicate Capability) indicates chair control capability.

- XR Transfer rate capabilities. Endpoint speeds over current connections and Px64 Multiplexes.
- For 384 kbps (H0) calls, endpoints indicate 384 kbps support, that displays as 384. On 336 kbps calls, endpoints must signal 384 kbps support. If an endpoint does not indicate support for 384 kbps on a 384/336 kbps conference, the MCU provides Audio Only Communications Mode (ACOM). For a 2B conference, the MCU sets the rate to 2x64, expecting the endpoints to do likewise (64x2 displays; if this is not displayed, no 64x2 capability exists). Endpoints may remove 2x64 (or the current channel rate: 384, 768, 1472, 1536) from their capability. This is Mode 0 forcing and is a normal procedure. The MCU provides AOCM if the endpoint does not signal support that matches the conference configuration.
- AUD Audio. Audio protocols that the endpoint supports. 711m and 711a are PCM (G.711) and support Mu and A-law, respectively. Endpoints require at least one. The g728 field indicates if G.728 is supported (LB_CELP). This value depends upon the endpoint type and configuration. The g722_48 field indicates endpoint support for G.722 (7 kHz) at both 48 kbps and 56 kbps. The g722_64 field indicates endpoint support for G.722 at 64 kbps in an unframed (unsupported by the MCU) mode.
- LSD Low Speed Data conferencing capabilities.
- HSD High speed Data conferencing capabilities.
- MLP Multi Layer Protocol Data capabilities.
- HMLP High Speed MLP data conferencing capabilities.

Page 5 - Endpoint Call Status Information

This page summarizes call-related status for per-channel join counts, join/drop times, drop reasons, drop codes, and auxiliary bonding drop codes. In addition, it contains drop codes and software fields from the previous call. The data on the page is retained. The Endpoint Call Status Information section groups all call-related fields. The only new field in this section is Join Count; all other fields are described in [Screen 8-8](#) and [Screen 8-9](#).

Screen 8-12. Page 5 of 6: status conference x endpoint y

Field descriptions

Join Count Tallies the number of times this endpoint joins this conference during this session. This counter starts with 0, increments to 64, and wraps around back to 1.

Page 6 - Administered Connections

This page summarizes information for administered connections associated with this endpoint. This data can be viewed while the conference is active.

status conference endpoint				page 6 of 6

12:	_____	_____	__	__	

Screen 8-13. Page 6 of 6: status conference x endpoint y

Field descriptions

Dial-out number Numbers that are dialed out by administered connections for each channel in the call. The dial Out #1 and #2 on page 1 of the forms display the DCP endpoint number. This is particularly useful with bonding dial-out calls.

Connection
 State

The call state of the AC. The following are connection states associated with dial-out ACs:

“enabled” = Transient in nature indicating that an AC is about to enter the “attempting to connect” state.

“disabled” = one of three options:

- The AC reaches an administered retry threshold, and all retries are stopped. To verify this, check the Error Log to see if an error type of 9 is logged against the AC.
- The AC is in a connected state with the far end disconnected.
- The initial channel call is not connected. No dial out call attempt is made for the additional channels until the initial channel has reaches a connected state.

“not scheduled” = Transient in nature, indicating that an AC is about to enter the “attempting to connect” state.

“waiting to retry” = The AC is inactive, waiting for the retry timer to expire. Once the timer expires, the AC sends a dial out call and enters the “attempting to connect” state. In this state, dial out calls fail at least once.

“attempting to connect” = The AC is active, but has not connected.

“connected” = The call associated with the AC is answered and joins cut-thru to the conference.

Retry Count

Tallies the attempted retries for this AC during join attempts and does not clear when the AC connects. However, it clears when the Redial feature attempts a new join. This differs from the `Join Count` which counts the number of times the channel joins the conference during this conference session.

Failure Cause

An ISDN or CPTR cause value (values lower than 0x7f) records when the last dial out call drops. Values above 0x7f are generated internally. [Table 8-7](#) lists all possible failure cause values displayed by this field and its associated description. The `Failure Cause` value logs in the Error Log and displays with the **display errors** command. (`Err Type` is normally displayed as a decimal.)

Table 8-7. Status AC - Failure Cause Values

Failure Cause (hexadecimal)	Description
0x00 (0t0)	N/A
0x01 (0t1)	Incorrect destination address
0x02 (0t2)	Reason unknown

Continued on next page

Table 8-7. Status AC - Failure Cause Values — Continued

Failure Cause (hexadecimal)	Description
0x06 (0t6)	Reason unknown
0x10 (0t16)	Normal call clearing
0x11 (0t17)	Endpoint not available
0x12 (0t18)	ISDN timer expired
0x15 (0t21)	Reason unknown
0x12 (0t22)	Destination address changed
0x1C (0t28)	Bad destination or access denied
0x1D (0t29)	Access denied
0x1F (0t31)	Reason unknown

Table 8-7. Status AC - Failure Cause Values — Continued

Failure Cause (hexadecimal)	Description
0xC2 (0t194)	Ring no answer
0xC8 (0t200)	Hi and dry - no feedback detected
0xC9 (0t201)	Cascade link administered wrong
0xCA (0t202)	CPTR not available to detect failure

status data-module

This command displays internal software state information for diagnosis. This command can help locate facilities to which the data module is communicating.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
busyout mis	<i>extension</i> <i>print</i>	data module extension Report prints if a printer is linked to the SAT. Examples: status data-module 30000 status data-module 32770 status data-module 32770 print	init inads craft cust rcust bcms browse	none	none

Output

For the following output example, the command that was entered is "status data-module 301".

```
status data-module 301
```

```
DATA-MODULE STATUS
```

```
Data Ext/Stn Ext for Stn DM: 301      Service State: out-of-service
Port/Channel Number: 01C1103      Maintenance Busy? no
CF Destination Ext:
Connected Ports:
```

Field descriptions

Data Ext/Sta Ext for Stn DM	The data module extension number. The DTDM is an exception: the connected station extension is shown.
Port/Channel Number	The port location of the data module (cabinet-carrier-slot-circuit). If the data module specified is a data channel, the channel number is shown instead.
Service State	This entry displays the status of the data module; valid states are: <ul style="list-style-type: none"> — In-service/idle — The data module is present but not in use. — In-service/active — The data module is present and is in use. — Out-of-service — The data module has been removed from service — Disconnected — The data module no longer appears to be present
CF Destination Ext	This entry displays the call forwarding destination, if any, of the station.
Maintenance Busy?	Whether maintenance is testing the object, "yes" or "no".
Connected Ports	Port locations to which the data module is connected (cabinet-carrier-slot-circuit).

status esm

This command displays the link status and equipment and software revision identifiers for the Expansion Service Module (ESM). See [“Expansion Services Module”](#) in [Chapter 5, “Routine Maintenance Procedures”](#) for more information.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status esm			init inads craft	none	none

Output

The following output example is a display of the **status esm** command.

```

status esm                                     page 1 of 1

                SYSTEM STATUS ESM

                Link Status: up

VINTAGE
                RMB Product ID: NA
                MSM Interface Card Vintage: 5.3.d
                UNIX System Revision SNumber: 1.1.4
                ESM Software Revision Number: ESM.4.2.07
                State of ESM Process Manager: 1
    
```

status hardware-group

Summary information for the active or last hardware group test displays. This display includes the number and percentage of tested maintenance objects, the percentage of tests passed, failed, and aborted, the time elapsed since initiating the hardware group test, the specific hardware group test command (see [“test hardware-group”](#) command) initiated, and the state (active/canceled/complete) of the hardware-group test.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status hardware-group	<i>print</i>	Report sent to printer. Examples: status hardware-group status hardware-group print	init inads craft cust rcust bcms browse	none	none

Output

The following output example is a display of the **status hardware-group** command.

```

status hardware-group                                page 1 of 1

                HARDWARE GROUP STATUS

Hardware Group Command State:    active
Number of MOs Tested:           11070
Total Number of MOs to be Tested: 12300
Percent Complete:                90%
Elapsed Test Time (hr:min:sec): 0:15:30
Repetition Number:              1
Percentage of Tests Passed:      82%
Percentage of Tests Failed:      11%
Percentage of Tests Aborted:     7%

                ENTERED HARDWARE GROUP COMMAND

Command: test hardware-group system
Test sequence: short
Test repetition: repeat 3
Output Options: failures
Hardware Options: SPE-interchange
    
```

Field descriptions

Hardware Group Command State:	“active” = testing in progress, “canceled” = testing canceled, “complete” = command completed; no testing occurring.
Number of MOs Tested:	Number of MOs in the specified group (refer to test hardware-group command) that the hardware-group command tests, including MOs that were tested or aborted due to resource contention.
Total Number of MOs to be Tested:	Number of MOs in the group specified in the test hardware-group command.
Percent Complete:	Ratio of the completed MOs to the MOs to test in the command.
Elapsed Test Time:	It tracks completion time for the hardware-group command. If a test cancels, then restarts, the time for the cancel period is excluded. The time displays in HH:MM:SS format.
Repetition Number	Number of completed iterations that correspond to the ‘repeat’ or ‘continuously’ option.
Percentage of Tests Passed:	Percentage of tests that passed.
Percentage of Tests Failed:	Percentage of tests that failed.

Percentage of Tests Aborted:	Percentage of aborted tests
Command:	Hardware-group action objects and qualifiers.
Test sequence:	Short or long.
Test repetition:	Displays continuously or the keyword repeats with the entered repeat value.
Output options:	Selections that were chosen on the input form: auto-page, background, or failures.
Hardware options:	Selections that were chosen on the input form: all-ports, or SPE-interchange.

status health

This command displays the current system alarm summary, maintenance busy summary, user summary, critical system status, and cabinet status. This same page displays with the **monitor health** command, except that the **status health** output page does not update periodically.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status health	<i>print</i>	Report prints to SAT-linked printer. Examples: status health status health print	init inads craft cust nms browse	none	High or Critical Reliability Systems = If standby SPE Emergency Transfer Select Switches change and handshakes are down, the displayed Emerg Trans field is incorrect until handshakes reactivate.

Output

The following output example is a display of the **status health** command.

```
status health

SPE: A/Auto B/functional OCC: ST: 9% Cp: 25% Sm: 10% Idl:66%
PNC: A-PNC/Auto B-PNC/functional ALARM:Maj: 0 Min: 2 Wrn: 9
Pwr: Comm Sync:local Logins:4 BUSYOUTS:Trk: 0 Stn: 0 Oth: 0

1 off 0| 7| 0 up
2 off 0| 0| 4 up
3 nia 0| 2| 0 up

-Press CANCEL to quit - 9:33 THU APR 16 :1993
```

Field descriptions

Major	Number of logged major alarms. (0–200)
Minor	Number of logged minor alarms. (0–200)
Warning	Number of warnings logged in the alarm file. (0–200)
Trunks	Number of maintenance busied out trunks.
Stations	Number of maintenance busied out stations.
Others	Combined number of maintenance busied out objects excluding trunks and stations.
Static	Proportion of the CPU that is dedicated to high priority items (for example, the operating system). This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent.
SM	Proportion of the CPU that is dedicated to system management or periodic and scheduled maintenance. If many periodic or scheduled maintenance tests perform, this occupancy percentage can be high without affecting service. This percentage rounds to the nearest integer; therefore, a percentage of 0=the occupancy is less than one half of a percent (for example, an 89.6% occupancy displays as 90%).
CP	Proportion of the CPU that is dedicated to call processing. This occupancy has priority over SM and IDLE occupancy categories, and if needed, takes processor time from these occupancy categories. This percentage is rounded to the nearest integer.
Idle	Available proportion of the CPU. This percentage is rounded to the nearest integer.
Active SPE	A or B indicate the active processor complex. When the active processor complex is locked on-line with lock switching on DUPINT, the “lock” option displays; otherwise, “auto” displays.
Duplicated?	Duplication status of the SPE component. “y” = duplication; “n” = no duplication.
SPE Power	Power source for the processor complex. (commercial) When commercial power is unavailable, battery backup is in use and is indicated with “backup”.
Time Source	The current timing source. Display values for this field vary according to timing sources selected. “external” = For Stratum-3 hardware, “internal” = an internal source, such as a tone clock. Primary and secondary timing sources must be administered for the Stratum-4 option. “primary”= the primary administered source is in use, “secondary” = the administered secondary source is in use. “local” = neither the primary or secondary sources are in use.
# Logins	Number of current users.

- Cab** Assigned cabinet number (1 to the highest system cabinet number).
- Emerg Trans** Settings for emergency transfer switches on the maintenance board for each cabinet. Available options are: auto-on (“auto+” or “a+”), auto-off (“auto-” or “a-”), “on”, “off”, and “n.a.”. The system defaults to “auto+” or “auto-”. In this state, emergency transfer activate automatically if the cabinet fails (“+”=emergency transfer is activate, “-” = emergency transfer is inactive). “on” = emergency transfer automatically activates. “off” = the cabinet cannot activate emergency transfers. Duplicated SPEs systems = switch settings for both processors of the PPN (cabinet 1) display. In this case, “auto+” is abbreviated “a+”, “auto-” is abbreviated “a-”, and “off” is abbreviated “of”. “on” does not change. “n.a.” = the emergency transfer switch setting is unavailable.
- Mj** Number of major alarms associated with the cabinet. Asterisks are used to fill fields when numbers exceed 99.
- Mn** Number of minor alarms associated with the cabinet. Asterisks are used to fill fields when numbers exceed 99.
- Wn** Number of warnings associated with the cabinet. Asterisks are used to fill fields when numbers exceed 99.
- PNC** Port Network Connectivity (PNC) status for each port networks within a cabinet. When multiple port networks exist, Carriers A, B, and C are listed first and separated from Carriers D and E by a slash (for example, up/up). Availability of the Expansion Archangel Link (EAL) determines PNC status of a port network. “up” denotes that the EAL is available. “dn” denotes that the EAL is unavailable.
- Time of Day** Current time of day acquired from the system.

status interface

This command displays the number of counters maintained by the PI. (a front end processor implementing packet layers and link layers of the BX.25 protocol and the integrated services digital network (ISDN) procedure-D protocols.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status interface	<i>location</i>	(cabinet-carrier-position) of the processor interface (PI board). 1 = the first processor interface in the carrier; 2 = the second processor interface in the carrier.	init inads craft cust rcust	1 (one)	none
	<i>print</i>	Report sent to printer. Examples: status interface a1 status interface 01a2 status interface 01b1 status interface b2 status interface b2 print	bcms browse		

Output

The following example is a display of the **status interface a1** command.

```
status interface a1

                PROCESSOR INTERFACE STATUS

Base Level Occupancy(low): 10
Base Level Occupancy(high): 25
Primary Queue Audit Error: 4
Secondary Queue Audit Error: 10
Translation Audit Error: 12
Protocol Timer Audit Error: 0
Hardware Sanity Timeout: 1
Hardware Resource Error: 12
Hardware Overload Error: 8
```

status isdn-testcall

The **status isdn-testcall** command displays the progress of an outgoing ISDN-PRI test call. The status form displays the tested ISDN-PRI B-channel port number, bit error rate, number of bits transmitted, block error rate, number of blocks transmitted, start time, duration specified, duration of test call and reason of termination.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status isdn-testcall	group number	administered number associated with each trunk group.	init inads craft	none	see below
	group member	administered number identifying a particular trunk within a trunk group.			
	number print	Report prints to SAT-linked printer. Examples: status isdn-testcall 80/1 status isdn-testcall 78/1 print			

Feature Interactions

If the bit error rate or block error rate is greater than zero, the ISDN-PRI trunk may be in trouble. The statistical information displayed on the terminal may deactivate the ISDN trunk. This is subjective because the ISDN trunk may be used for data or voice. If the trunk is used for data and the rates are high, the trunk should be deactivated. If the trunk is used for voice, the trunk may not be deactivated. Also, high rates be at risk for some type of power hit.

Output

The following output example is a display of the **status isdn-testcall 80/1** command.

```

status isdn-testcall 80/1                               Page 1 of 1   SPE A
                ISDN TESTCALL STATUS
    Port      Bit Error Rate  Number Of Bits  Block Error Rate  Number Of Blocks  Start Time  Duration Specified  Of Test  Reason Of Termination
    1B1401    0EE0 4EE7      0EE0 6EE2      25/12:36 120          100          in progress
    
```

Field descriptions

Port	(cabinet/carrier/slot/circuit) of the ISDN-PRI B-channel.
Bit Error Rate	The measured bit error count based on the comparison between sent and received bit patterns. (Number displays in scientific notation)
Number of Bits	Number of bits generated. (Number displays in scientific notation)
Block error Rate	The measured block error count based on the comparison between sent and received bit patterns. (Number displays in scientific notation).
Number of Blocks	Number of blocks generated. (Number displays in scientific notation)
Start Time	Test call start time. (dd/hh:mm).

Duration Specified	Specified run time for the test call. (1-120 minutes, or blank = default of 10 seconds).
Duration of Test	Run time for the test call, listed in minutes. "blank" = a default time.
Reason of Termination	Reason that the test call terminates: "finished," "canceled," "overflow," "no bits," "transmission," "internal fail," "data corrupt," "call dropped," "call rejected," and "in progress." "finished" = the test finishes in the specified time. "canceled" = the test call cancels with the clear isdn-testcall command. "overflow" = the transmitted bits overflow buffer allocation. "no bits" = no bits are received because the ISDN-PRI test call circuit connection is bad. "transmission" = a data transmission interrupts, probably from a power hit. "call dropped" = the call drops due to an abnormal termination, or inability to cut-through to the other side. "call rejected" = the originating call is not set up properly. "internal fail" = an internal error on the Maintenance/Test circuit pack. "in progress" = the test is still running; "data corrupt" = any other error condition.

status journal-link

The **status journal-link** command displays if the link is up or down. If the link is down, the system displays the number of times the switch tries to initialize the link. A journal printer documents automatic wake-up events, emergency access to attendant events, and housekeeping events when the property management system is not functional. A journal printer may also generate reports for automatic wake-up events and emergency access events at a scheduled time. If system configuration includes two printers, one is for housekeeping events only and the other is for automatic wake-up events and emergency access events.

For general information on journal printer links, see the description of the ["busyout journal-printer"](#) command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status journal-link	wakeup-log	printer that handles automatic wakeup and emergency access to attendant events and scheduled reports.	init inads craft cust rcust bcms browse	none	none
	pms-log	printer that handles pms down events.			
	print	Reports print to SAT-linked printer. Examples: status journal-link wakeup-log status journal-link pms-log status journal-link pms-log print			

Output

The following example is a display of the **status journal-link wakeup-log** command.

```
status journal-link wakeup-log

                                JOURNAL LINK STATUS

Link State: up
Maintenance Busy? no
```

Field descriptions

- Link State** If extensions are administered in the System Parameters Hospitality form, wakeup-logs or pms-log links are considered to be administered only.
- Maintenance Busy** Is maintenance testing performing on the link?

status link n

This command displays information about a C-LAN, Ethernet link:

- static information about the link
- the modem used, connect speed, and protocol information
- a counter of CHAP failures for PPP links
- time information for PPP and Ethernet links (includes the time of the last reset, the last hour start time, and end time for the error counter statistics).

See [“Output \(with PI\)”](#) for descriptions of the form for systems with Processor Interface (PI) circuit packs administered.

The same information that is displayed by the status link command can also be invoked with:

- **status pgate-port** for PGATE links
- **status clan-port** or **netstat link n** for C-LAN links.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status link	<i>n</i>	Number of the administered link. Example: status link 1	init inads craft	none	none

Output

The following example shows page 1 of the output from the **status link n** command on systems with the Net Packet/Packet Interface circuit pack administered.

Link/Port Status form (page 1)

```

status link 1                                     Page 1 of 3
                LINK/PORT STATUS
    Link Number: 1
    Link Status: connected
    Link Type: ethernet
    Link Name: ethernet on link 1
    Service Port Location: 01A0917
    Service Port Data Extension: 2991
    Service State: in-service/idle
    Node Name: ber1
    Source IP Address: 192.168.10.11
    Subnet Mask: 255.255.255.0
    Broadcast Address: 255.255.255.255
    Physical Address: 00:00:00:00:00:00
    Enabled? yes
    Maintenance Busy? no
    Active Channels: 0
    
```

Field descriptions (page 1)

Link Number	Administered link number (assigned by add/change data-module command)
Link Status	Displays no, yes, unavail, connected, disconnected, enabled, out-of-service, or restarting
Link Type	The type of interface according to the physical/link protocol(s) immediately "below" the network layer in the protocol stack (ethernet, ppp, bx.25)
Link Name	Administered link name (assigned by add/change data-module command)
Service Port Location	Administered port location (assigned by add/change data-module command)
Service Port Data Extension	Administered extension number (assigned by add/change data-module command)
Service State	Displays: in-service/idle, in-service/active, disconnected, out-of-service, maintenance busy, in-service, inactive, active, idle
Node Name	Administered node name (assigned by add/change data-module command)

8 Maintenance Commands and Trouble-Clearing Aids
status link n

8-308

Source IP Address	Administered IP address (assigned with change node-name or add/change data-module commands)
Subnet Mask	Administered subnet mask address (assigned by add/change data-module command)
Broadcast Address	Administered broadcast address (assigned by add/change data-module command)
Physical Address	The interface's address (CLAN circuit pack) at the protocol layer immediately "below" the network layer in the protocol stack.
Enabled	y (yes) or n (no)
Maintenance Busy?	y (yes) or n (no)
Active Channels	Number of active channels

Error Counters form (page 2)

```

status link 1                                     Page 2 of 3
          ERROR COUNTERS
Reset Time: 04/08 14:46
Last Hour Start Time:                               End Time:
Incoming Received:   Unicast Pkts   Multicast Pkts   Octets
    Since Reset
    Last Hour
Incoming Dropped:   Error Pkts     Discard Pkts
    Since Reset
    Last Hour
Outgoing Transmitted: Unicast Pkts   Multicast Pkts   Octets
    Since Reset
    Last Hour
Outgoing Dropped:   Error Pkts     Discard Pkts
    Since Reset
    Last Hour
CRC Check: 0          Collision Count: 0
    
```

Field descriptions, page 2

Incoming received Unicast packets	The number of subnetwork-unicast packets delivered to a higher-layer protocol.
Incoming received multicast packets	The number of non-unicast (subnetwork-broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol.
Incoming dropped octets	The total number of octets received on the interface, including framing characters.
Incoming errored packets	The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.

8 Maintenance Commands and Trouble-Clearing Aids
status link n

8-309

Incoming packets discarded	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
Outgoing Transmitted unicast packets	The total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.
Outgoing multicast packets	The total number of packets that higher-level protocols requested be transmitted to a non- unicast (subnetwork-broadcast or subnetwork-multicast) address, including those that were discarded or not sent.
Outgoing transmitted octets	The total number of octets transmitted out of the interface, including framing characters.
Outgoing errored packets	The number of outbound packets that could not be transmitted because of errors.
Outgoing packets discarded	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

Processor Channel Status form (page 3)

The example below is for processor channels (page 3 of the form). Information about administered hop channels displays on page 4 of the form.

The processor or hop channel status information can take either 1 or 2 pages on this form, depending on the number of links being reported and their condition. Hop channel information (shown only for BX.25 links using the Processor Interface or PGATE circuit packs) uses only 1 page.

```
status link 1 Page 3 of 3
                PROCESSOR CHANNEL STATUS

UP: 001, 007, 010-115
    199, 300:310

DN: 001-002

PND: 003, 216-220, 299
```

Field descriptions, page 3

NOTE:

A dash (-) or a colon (:) between numbers indicates all numbers including and between the indicated numbers.

UP: Channels are up.
 DN: Channels are down.
 PND: Channels are in a pending state from the down to the up state (processor channels only)

Output (with PI)

The following example shows the output from the **status link 1** command from a system with Processor Interface (PI) circuit packs administered.

```

Page 1 of 4

LINK / PORT STATUS

Link Number: 1
Link Status: disconnected
Link Type: proc-intf
Link Name: audixa
Service Port Location: 01A0301
Service Port Data Extension: 4011
Service State: in service/idle
Enabled: y
Maintenance Busy? n
Active Channels: 0

CONNECTED TO:

Destination: TDMODULE
Destination Status: in-service/active
AC: 1 Connected/Orig
Destination Port: 1C0303
Destination Extension: 4002
    
```

Field descriptions, page 1

Only those fields that are different from ["status link n"](#) are listed here.

Destination	Name of the destination (assigned with the add/change data-module command)
Destination Status	in-service/idle, in-service/active, disconnected, out-of-service, in-service, inactive, active, idle
AC	Active channel
Destination Port	Administered port location (assigned with the add/change data-module command)

Destination Extension Administered destination extension number (assigned with the **add/change data-module** command). This may be replaced by Trk/Mem data (like the PI status line form) depending upon the type of destination.

status pms-link

This command displays the status of the property management system interface link. If the link is up, whether or not a data base swap is taking place between the switch and the property management system (PMS), is displayed. If the link is down, the number of times the switch has tried to set up the link is displayed.

A PMS is a standalone computer system that can be integrated with the switch to enhance the service capability for a hotel/motel.

For general information on PMS links, see the description of the ["busyout pms-link"](#).

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status pms-link	<i>print</i>	Report sent to printer Examples: status pms-link status pms-link print	init inads craft cust browse	none	none

Output

The following example shows the output from the **status pms-link** command.

```
status pms-link

                PMS LINK STATUS

Physical Link State: down
  Protocol State: down
  Number of Retries: 3
  Maintenance Busy? no
```

Field descriptions

Physical Link State Up, down, or extension not administered; link is considered administered only if an extension is given in the System Hospitality form.

Protocol State up, down, or blank if not administered.

Number of Retries Number of times the switch has tried to set up the link (only displayed when the link is down; range 1-999)

Maintenance Busy yes or no (technician has or has not busied out the link), blank if PMS link not administered.

status pri-endpoint

This command displays internal software state information for diagnosis and can help locate facilities with which a PRI endpoint is communicating. Status information for each of the B-channels making up the PRI endpoint display in addition to some overall PRI endpoint information.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status pri-endpoint	<i>extension</i>	PRI endpoint extension to be displayed (see dial-plan).	init inads	none	none
	<i>print</i>	Report sent to printer Examples: status pri-endpoint 25012 status pri-endpoint 77868 status pri-endpoint 66078 print	craft nms browse		

Output

The following example shows the output for the `status pri-endpoint 22501` command and assumes the following:

- PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6.
- The ports 1 to 3 of the specified PRI endpoint are connected on an active call to ports 13 to 15 of board in location 1B19 (cabinet 1, carrier B, slot 19).
- Ports 4 and 5 of the specified PRI endpoint are idle.
- Port 6 of the specified PRI endpoint is out of service, and background maintenance testing is being performed on the port.

NOTE:

A PRI endpoint can initiate and receive a call on any one or more of the B-channels making up the PRI endpoint.

```
status pri-endpoint 22501                                page 1 of 1
```

PRI-ENDPOINT STATUS

```

                Extension: 22501                        Width: 6
        Signaling Group ID: 3                B-Channels Active: 3
    Originating Auto Restoration? n        B-Channels Idle: 2
    
```

Port	Service State	Test In Progress	Connected Port
01B2001	in-service/active	n	01B1913
01B2002	in-service/active	n	01B1914
01B2003	in-service/active	n	01B1915
01B2004	in-service/idle	n	
01B2005	in-service/idle	n	
01B2006	out-of-service-NE	y	

Command Successfully Completed

Note that the line listing of each B-channel's status may continue onto the next page. The user is prompted to press the **NxtPg** key to continue the display.

Field descriptions

Extension	PRI endpoint extension
Width	Administered number of B-channels associated with the specified PRI endpoint
Signaling Group ID	ID number of the signaling group that handles the signaling for the ports in the specified PRI endpoint
Originating Auto Restoration	Administered option for the auto restore feature (restores calls originated from this PRI endpoint in the case of network failure): y = restoration option enabled n = restoration option disabled
B-Channels Active	The number of B-channels active on a call
B-Channels Idle	The number of B-channels in the in-service/idle state
Port	Port locations (cabinet-carrier-slot-circuit) for each of the B-channels making up the PRI endpoint.

- Service State** Service state of the B-channels:
 in-service/active, in-service/idle, out-of-service-NE,
 out-of-service-FE, maint-NE/active, maint-FE/active, maint-NE/idle,
 and maint-FE/idle.
- NE (Near End) and FE (Far End) refer to which “end” of the
 B-channel has placed the facility in the current state. NE refers to
 the switch and FE refers to the PRI terminal adapter (or any device
 that terminates the D-channel signaling on the facility).
- Test In Progress** Whether or not there is any current maintenance testing on the
 port.
- Connected Port** Connected port location (cabinet-carrier-slot-circuit) for each of
 the B-channels active on a call.

status processor-channel

This command displays the status of the specified processor channel and the values of its various counters. A processor channel is 1 of 64 logical channels associated with an SCI link. Each processor channel terminates in the switch processing element with a session.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status processor-channel	<i>channel number</i>	Processor channel number (1-64).	init	none	none
	<i>print</i>	Report sent to printer Examples: status processor-channel 1 status processor-channel 10 status processor-channel 64 status processor-channel 64 print	inads craft cust rcust bcms browse		

Output

The following example shows the output from the **status processor-channels 1** command.

PROCESSOR CHANNEL STATUS

Channel Number: 1

Channel Status: Administered but not connected

Link Number: 3

Link Type: BX.25

Message Buffer Number: 0

Reset Count: 0

Retransmission Count: 0

Field descriptions

Channel Number The processor channel number 1-64.

Channel Status Displays the state the session layer protocol is in. The following describes the various session layer states:

- Channel is not administered.
- Channel is in a state entering “wait session accept” (WSA).
- Channel is in a state waiting for a “session accept” message from the far end.
- Channel is in data transfer state (channel is up and running).
- Channel is in resynchronization state.
- Channel is waiting for acknowledgement of disconnect message.

Channel Number The processor channel number 1-64.

Link Type X.25, Ethernet, or PPP

status signaling-group

This command displays the state, type, port location, and state of the Primary and Secondary D-channels within the group. A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status signaling-group	group identifier	Administered group identifier number (1-8)	init	none	none
	print	Report sent to printer Examples: status signaling-group 1 status signaling-group 2 print	inads craft cust browse		

Output

The following output example shows the output from the **status signaling-group 1** command.

```

status signaling-group 1                               Page 1 of 1   SPE A

                STATUS SIGNALING-GROUP

Group ID: 1
  Type: facility associated signaling
Group State: in-service

                Primary D-Channel

Link: 1      Port: 01C1924  Level 3 State: in-service

                Secondary D-Channel

Link:      Port:      Level 3 State:
    
```

Field descriptions

- Group ID:** Numerical ID of the signaling group (1-8)
- Type:** *facility associated signaling*: all members are on a single DS-1 facility. Facility associated signaling groups support only the simplex D-channel configuration.
- non-facility associated signaling*: members can be carried by multiple DS-1 facilities.
- The DS-1 facility is identified across the ISDN-PRI using an explicit facility identifier. In a simplex configuration one D-channel is used to signal for B-channel members, while in a duplex configuration two D-channels are used to signal for B-channel members (one channel is active and the other is used as a backup to the active channel).

Group State: *in-service*: one of the D-channels signaling for the group is in service

out-of-service: neither D-channel in the group is in service

NOTE:

If there is no D-channel backup and the primary D-channel is out-of-service, then the signaling group is in an out-of-service state.

Link: Link transporting the D-channel

Port: Address of the port transporting either the primary or secondary D-channel

Level 3
State: State of the primary or secondary D-channels:

in-service: a D-channel is "in-service" when it is in the multiple-frame-established state at layer 2 carrying normal call-control signaling at layer 3.

standby: a D-channel is "standby" when it is in the multiple-frame-established state at layer 2, and not carrying any layer 3 call-control messages on logical link 0,0.

wait: a D-channel is in a "wait" state when an attempt has been made by one side of the interface to establish layer 3 peer communications as part of the process of going to the "in-service" state, which is transitional in nature. Only when the `ISDN SERVICE` message is sent over the interface, and the far end of the interface responds with a `SERVICE ACKnowledge` message is the D-channel placed in the "in-service" state.

maintenance-busy: a D-channel is "maintenance-busy" when it is not in the multiple-frame-established state at layer 2. This state is entered automatically when an active D-channel is declared failed. A D-channel that has been placed in the "maintenance-busy" state may be placed in the "out-of-service" state without system technician intervention.

manual-out-of-service: a D-channel is "manual-out-of-service" when system technician intervention has caused it to be placed in the TEI-assigned state at layer 2. System Technician intervention is required to retrieve a D-channel from this state.

out-of-service: a D-channel is "out-of-service" when it is in the TEI-assigned state at layer 2, but is periodically requested by layer 3 to attempt to establish the link.

no-link: no link is administered for the D-channel

status sp-link

This displays a page of output summarizing the operational status of the system printer link: its link state, number of retries, and whether the link is maintenance busy.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status sp-link	<i>print</i>	Report sent to printer Examples: status sp-link status sp-link print	init inads craft cust rcust bcms browse	none	none

Output

The following example shows the output for the **status sp-link** command.

```
status sp-link                               SPE A

                                     SYSTEM PRINTER LINK STATUS

Link State: up
Number of Retries:
Maintenance Busy? no
```

Field descriptions

- Link State:** Operational mode of the link:
 up: the link is administered and a call is setup between the switch and the system printer.
 down: the link is administered, but a call is not setup between the switch and the system printer.
 extension not administered: the link (no system printer extension) is not administered
- Number of Retries:** Number of times the switch has tried to set up the link since a request to set up the link was received (1-999); if more than 999 retries have occurred, 999 still displays. (This field displays only if the **Link State:** field is down.)
- Maintenance Busy?** Whether any maintenance testing is being performed on the system printer link:
 yes and no: system printer link is administered
 blank: system printer link is not administered.

status station

This command displays the internal software state information for diagnosis and to help locate the facilities to which the station is communicating.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status station	<i>extension</i>	Station extension (per dial-plan)	init	none	none
	<i>print</i>	Report sent to printer Examples: status station 10020 status station 83277 status station 83277 print	inads craft cust browse		

Output

The following example shows the output for the **status station 1002** command.

```
status station 1002
```

GENERAL STATUS

```

Type: 7405D           Service State: in-service/on-hook
Extension: 1002       Maintenance Busy? no
Port: 01C0702        SAC Activated? no
Call Parked? no      User Cntrl Restr: none
Ring Cut Off Act? no Group Cntrl Restr: none
CF Destination Ext:
Message Waiting:
Connected Ports:
```

ACD STATUS

HOSPITALITY STATUS

```

Agent Logged In   Work Mode           AWU Call At:
User DND: not activated
Group DND: not activated
Room Status: non-guest room

On ACD Call? no
```

Field descriptions

Type	Administered station type
Extension	Station or attendant extension
Port	Port location: cabinet-carrier-slot-circuit
Call Park	Whether the station has a call parked (yes or no)
Ring Cut Off Activated	Whether ring cut off is activated (yes or no)

CF	Call forwarding destination extension, if any.
Destination	
Ext	
Message	Whether there is a message waiting for the station. "AP-SPE",
Waiting	"AUDIX", "PMS" or blank if no messages are waiting.
Connected	Port locations of the facilities to which the station is connected:
Ports	cabinet-carrier-slot-circuit
Agent Logged	Displays (underneath) the hunt groups (up to 3) that the agent is
In	logged into
On ACD Call?	Whether the agent is on an ACD call currently (yes or no).
Work Mode	Work mode of each hunt group that an agent is logged into
Service State	In service/on-hook, in service/off-hook, in-service/in-tsa (Terminal
	Self Administration), out of service, or disconnected.
Maintenance	Whether maintenance is testing the object (yes or no)
Busy State	
SAC Activated	Whether send all calls is activated (yes or no)
User Cntrl	One or two of the following: none, total, stat-stat, outward
Restr	or terminate.
Group Cntrl	One or two of the following: none, total, stat-stat, outward
Restr	or terminate.
AWU Call at	Time that Automatic Wakeup Call is scheduled
User DND	Status of the do not disturb feature.
Group DND	Status of the group do not disturb feature.
Room Status	Whether a room is occupied or not (non-guest room, vacant, or
	occupied).

status synchronization

This command displays the location of the DS1 or tone-clock circuit pack that is used for an on-line synchronization reference. The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status synchronization	<i>print</i>	Report sent to printer Examples: status synchronization status synchronization print	init inads craft cust browse	none	none

Output

The following example shows the output for the **status synchronization** command.

```
status synchronization
```

```
SYNCHRONIZATION STATUS
```

```
Stratum Level:4  
Maintenance Name: TONE-BD Physical Location: 01A  
Switching Capability: Enabled  
Excessive Reference Switching: No
```

Field descriptions

Stratum Level	Synchronization stratum level (3 or 4)
Maintenance Name:	Either TONE-BD, DS1-BD, or STRAT-3.
Physical Location	Board location of the selected DS1 or tone-clock circuit pack (cabinet-carrier-slot for a DS1; cabinet-carrier for a tone-clock)
Switching Capability	Whether the on-line reference for synchronization can be switched (Enabled or Disabled)
Excessive Reference Switching	High-level description of how many times the synchronization reference has been switched. If excessive reference switching is taking place (sync error 1793 is at threshold), this field displays Yes; otherwise No displays.

status system

This command displays the status, mode, and operational attributes of the SPE(s), TDM and Packet busses, tone-clock circuit pack(s), expansion interface links (exp-links), and emergency transfer switch of single or all cabinets in the system.

CAUTION:

The purpose of this command is to provide general information about the cabinet status. This information may not display correctly when the cabinet is in a transient period. In this case, wait for 1 minute and enter the command again.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status system	cabinet	<p>1st-cabinet: PPN 2nd-cabinet: 1st EPN 3rd-cabinet: 2nd EPN¹ all-cabinets: 3-pg. output - 1 for each cabinet ²</p> <p>Examples: status system 1st-cabinet status system 2nd-cabinet status system 3rd-cabinet status system all-cabinets</p>	init inads craft cust rcust bcms browse	none	none

1 For PPN, and 1st and 2nd EPNs, one page of output displays.

2 The status displayed for a cabinet is always related to that cabinet except in the case of status for EPNs and the SPE attributes. SPE attributes always refer to PPN status regardless of which cabinet is being displayed.

Output

The following example shows the output from the **status system all-cabinets** command.

```
status system all-cabinets                               Page 1 of 3   SPE B

                SYSTEM STATUS CABINET 1

                        01A02-03A01 in  active
                        01B02-03B02 in  standby
```

Field descriptions

- SPE** Switch Process Element (SPE) identifier: 1A or 1B
- MODE** SPE modes are different for simplex systems than for duplicated systems. See [“SPE Modes”](#) section that follows.
- SELECT SWITCH** SPE select switch position:
- **auto**: the switch is in the middle position and automatically switches SPE depending upon conditions
 - **spe-a**: spe-a position
 - **spe-b**: spe-b position
 - **<blank>** always appears for the 1A and 1B SPE in a simplex system. In a system with High or Critical Reliability, blank implies a hardware problem with the Duplication Interface circuit pack.
- PE ALARMS - MAJOR** Number of Major alarms associated with the SPE complex that affect the fault severity level of this SPE. If the system is simplex system, then the 1B SPE always shows blank.

8 Maintenance Commands and Trouble-Clearing Aids
status system

8-324

SPE ALARMS - MINOR	Number of Minor alarms associated with the SPE complex that affect the fault severity level of this SPE. If the system is simplex system, then the 1B SPE always shows blank.
TONE/CLOCK	Location of the tone-clock circuit pack. Valid locations are 1A, 1B, 2A, 2B, 3A, and 3B.
SERVICE STATE	<ul style="list-style-type: none">■ <i>in</i>: Tone-Clock is installed and is in-service■ <i>out</i>: Tone-Clock failed certain maintenance tests and has been removed from service■ <i><blank></i> In simplex systems there is no B-carrier Tone-Clock, and this field displays blank.
SYSTEM CLOCK	Shows which Tone-Clock supplies the system clock for the cabinet displayed: <ul style="list-style-type: none">■ <i>active</i>: Tone-Clock active and supplying system clock■ <i>standby</i>: Tone-Clock is standby and ready to supply the system clock for this cabinet if the active clock fails.■ <i>down</i>: Tone-Clock failed some maintenance activity and cannot supply the system clock for this cabinet.■ <i>unavail</i>: EPN is currently down■ <i><blank></i> If simplex, then the 1B Tone-Clock for the PPN displays blank; if no EPN, then both the 1A and 1B Tone-Clock for this EPN display blank.
SYSTEM TONE	Shows which Tone-Clock circuit pack supplies the system tones for the cabinet being displayed. <ul style="list-style-type: none">■ <i>active</i>: Tone-Clock active and supplying system tones■ <i>standby</i>: Tone-Clock is standby and ready to supply the system tones for this cabinet if the active clock fails.■ <i>down</i>: Tone-Clock failed some maintenance activity and cannot supply the system tones for this cabinet.■ <i>unavail</i>: EPN is currently down■ <i><blank></i> If simplex, then the 1B Tone-Clock for the PPN displays blank. If the system does not have an EPN, then both the 1A and 1B Tone-Clock for this EPN display blank.
TDM	The TDM Bus identifier (1A, 1B, 2A, 2B, 3A and 3B)
SERVICE STATE	Operational state of the TDM Bus circuit pack: <ul style="list-style-type: none">■ <i>in</i>: TDM Bus installed and is in-service■ <i>out</i>: TDM Bus failed certain maintenance tests and has been removed from service
CONTROL CHANNEL	Whether the control channel is on this TDM Bus (<i>y</i> or <i>n</i>)

DEDICATED TONES	Whether the dedicated tones are on this TDM Bus (y or n)
PKT	<p>Packet Bus identifier (same as the cabinet number: 1, 2, or 3). If the system is running on a X75XE cabinet, all the PKT fields are blank and the following message displays:</p> <pre>S75XE does not support Packet</pre> <p>Refer to Packet Bus Maintenance descriptions for more information.</p>
SERVICE STATE	<p>The operational state of the Packet Buses:</p> <ul style="list-style-type: none">■ <code>in</code>: Packet Bus in-service and operating normally.■ <code>out</code>: Packet Bus failed certain maintenance tests and has been removed from service.■ <code>reconfig</code>: Maintenance/Test circuit pack has swapped one or more signal leads because of lead faults detected during testing (High or Critical Reliability only).■ <code>open lds</code>: Maintenance/Test circuit pack cannot correct all of the Packet Bus faults. There are open leads, but the Packet Bus is still at least partly functional (High or Critical Reliability System only).■ <code>unavail</code>: EPN is currently down.■ <code><blank></code> System does not have the Packet Bus feature.
BUS ALARMS-MAJOR	Whether Major alarms exist for packet bus components (y or n)
BUS ALARMS-MINOR	Whether Minor alarms exist for packet bus components (y or n)
BUS FAULTS	<p>Number of faulty bus leads (defined as shorted to another lead, stuck at some value, or an open lead: 0 - 24). This field may take on any integer between 0 and 24. This field displays blank if:</p> <ul style="list-style-type: none">■ Maintenance/Test circuit pack not present■ Packet Bus port of the Maintenance/Test circuit pack has been taken out-of-service■ System does not have the Packet Bus feature
OPEN BUS LEADS	<p>Number of open bus leads between the Maintenance/Test circuit pack and bus terminator (0 - 24). This could mean physical damage to the backplane or its connectors or a missing bus terminator. This field displays blank if:</p> <ul style="list-style-type: none">■ Maintenance/Test circuit pack is not present■ Packet Bus port of the Maintenance/Test circuit pack has been taken out-of-service■ System does not have the Packet Bus feature.

EMERGENCY TRANSFER	Location of the Processor or EPN Maintenance circuit pack containing the Emergency Transfer Select Switch (1A and 1B for the PPN, and 2A or 3A for the EPNs)
SELECT SWITCH	<p>Emergency Transfer Switch position on the Processor(s) or the EPN maintenance circuit pack and the state of Emergency Transfer in the cabinet display:</p> <ul style="list-style-type: none">■ on: If this is a Simplex PPN or an EPN, then designated analog phones in this cabinet are cut through to CO trunk lines only in an emergency situation. In a High or Critical Reliability System, the Emergency Transfer Switches on both SPEs in the PPN must be in the on position before Emergency Transfer is invoked for the PPN.■ off: Regardless of Simplex or Duplex, PPN, or EPN, Emergency Transfer is off and cannot be invoked. The switch should only be in this state when a service technician is on sight.■ auto-on: The switch is in the or auto position, however, because of a serious system fault, system software has invoked Emergency Transfer.■ auto-off: Switch in the auto position; because system has no serious faults, system software has not invoked Emergency Transfer■ unavail: EPN is down■ <blank> If the system is Simplex, then the 1B Emergency Transfer indication for the PPN displays a blank. If the system does not have an EPN, then both the 1A and 1B Emergency Transfer indications for the EPN displays a blank.
EXP-LINK	<p>Expansion Links that originate from this cabinet and the locations of the two Expansion Interface circuit packs that make up the link. If the Expansion Link does not exist in the system then a dash (-) displays.</p> <ul style="list-style-type: none">■ Expansion Link identifiers for the PPN or Cabinet 1: 1A01-2A01, 1B01-2B02, 1A02-3A01, 1B02-3B02■ Expansion Link identifiers for the first EPN or Cabinet 2: 1A01-2A01, 1B01-2B02, 2A02-3A02, 2B03-3B03■ Expansion Link identifiers for the second EPN or Cabinet 3: 1A02-3A01, 1B02-3B02, 2A02-3A02, 2B03-3B03
SERVICE STATE	<p>Operational state of the Expansion Interface Link:</p> <ul style="list-style-type: none">■ in: Expansion Interface Link installed and is in-service■ out: Expansion Interface Link failed certain maintenance tests and has been removed from service■ <blank> Expansion Interface Link does not exist

MODE	<ul style="list-style-type: none"> ■ <i>active</i>: Expansion Interface Link is in-service and providing the active connectivity between the two cabinets. ■ <i>standby</i>: Expansion Interface Link is in-service and ready to provide connectivity between the two cabinets should the active link fail. ■ <i>down</i>: Expansion Interface Link is out-of-service and cannot provide connectivity between the two cabinets. ■ <i><blank></i> Expansion Interface Link does not exist
CABINET TYPE	<ul style="list-style-type: none"> ■ <i>MCC</i>: Medium Carrier Cabinet (up to 5 carriers, simplex or duplex as a PPN) ■ <i>SCC</i>: Single Carrier Cabinet (up to 4 carriers, simplex or duplex as a PPN) ■ <i>EMCC</i>: Enhanced Medium Carrier Cabinet (up to 5 carriers, can only be a simplex or duplex PPN cabinet) ■ <i>ESCC</i>: Enhanced Medium Carrier Cabinet (up to 4 carriers, can only be a simplex or duplex PPN cabinet) ■ <i>MICRO</i>: Micro or wall-mounted cabinet (always exists alone as an A carrier in a simplex PPN)

SPE Modes

Simplex SPE Modes

<i>active</i>	1A SPE in a simplex system is always the active SPE
<i>blank</i>	No 1B SPE in a simplex system

Duplex Active SPE Modes

<i>active</i>	This SPE is the active SPE.
<i>active/override-on</i>	This the active SPE; however, it was forced active through a reset system interchange health-override command.
<i>selected</i>	This is the active SPE; however, the SPE select switches do not allow this to become the standby SPE.

Duplex Standby SPE Modes

Standby Mode

<i>standby</i>	SPE is held reset, memory shadowed from the active SPE, and ready to take over as the active SPE.
----------------	---

Busyout Modes

<i>busyout/idle</i>	SPE busied out and there is no current maintenance activity. The active SPE can be either active or selected.
---------------------	---

busyout/entering	SPE busied out and in the process of restarting the switch software on this SPE. After the switch software finishes its initialization, the standby SPE is available for maintenance functions on the standby SPE.
busyout/testing	SPE busied out, however, the switch software on this SPE has been restarted and is currently in the process of executing a test command.
busyout/ not-refreshed	SPE busied out, however, the busyout spe-standby command was executed at a time when the standby memory was not refreshed. The standby SPE is not able to perform any maintenance or SAT-requested activities until a successful refresh spe-standby command is executed.
busyout/ list-config	SPE busied out, however, the switch software on this SPE has been restarted and is currently executing a list configuration command.
busyout/status	SPE busied out, however, the switch software on this SPE has been restarted and is currently in the process of executing a status card-mem command.

Maintenance Modes¹

maint/init	SPE in maintenance mode (system restarted within the last 10 minutes). During this time, the standby SPE is not placed into standby mode just in case a core dump is being written to the tape or memory card on the standby SPE.
maint/idle	SPE in maintenance mode, but no current maintenance activity. The active SPE can be either active or selected.
maint/entering	SPE currently restarting the switch software on this SPE. After the switch software on this SPE finishes its initialization, the standby SPE is available to perform maintenance functions.
maint/testing	SPE in maintenance mode executing a test command.
maint/ not-refreshed	SPE in maintenance mode executing a destructive background maintenance test that has temporarily left the standby memory not refreshed. After the current test finishes, background maintenance refreshes the standby SPE.
maint/not-tested	SPE in maintenance mode because previously the active SPE had been selected with the SPE select switches. Since the active SPE was not selected, the standby has not been tested to ensure the standby can enter standby mode. Once the standby is tested successfully, the standby returns to standby mode.
maint/list-config	SPE in maintenance mode and currently executing a list configuration command.
maint/save~trans	SPE in maintenance mode and is currently executing a save translation command.

<code>maint/ save~announce</code>	SPE in maintenance mode and currently executing a save announcement command.
<code>maint/status</code>	SPE in maintenance mode and currently executing a status card-mem command.
<code>maint/patching</code>	SPE in maintenance mode and currently applying a software patch to the standby SPE memory.
<code>maint/periodic</code>	SPE in maintenance mode and currently performing periodic background maintenance (performed every two hours if some component of the standby SPE is alarmed).
<code>maint/scheduled</code>	SPE in maintenance mode and currently performing daily scheduled background maintenance.
<code>maint/analysis</code>	SPE in maintenance mode and currently performing background maintenance testing in response to a reported trouble by some component in the active or standby SPE complex that relates to the standby SPE.
<code>maint/upgrade</code>	SPE in maintenance mode and currently performing a software upgrade.

Down Modes²

<code>down/bad_upgrade</code>	SPE in down mode (software upgrade attempt failed). The standby SPE remains in down mode until a successful software upgrade is performed.
<code>down/idle</code>	SPE in down mode, however, no maintenance activity is currently taking place. The active SPE could be either active or selected.
<code>down/entering</code>	SPE in down mode, but is currently trying to restart the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE is ready to perform background or SAT requested maintenance activity.
<code>down/mismatch_ soft</code>	SPE in down mode because the software vintage in flash memory of the standby SPE does not match the vintage in the active SPE. The standby SPE remains in down mode until a successful software upgrade is performed.
<code>down/testing</code>	SPE in down mode attempting to execute a test command.
<code>down/ not-refreshed</code>	SPE in down mode executing a destructive background maintenance test that has temporarily left the standby memory not refreshed. After the current test finishes, background maintenance refreshes the standby SPE.

down/analysis SPE in down mode and currently performing background maintenance testing to determine if the problem has been corrected.

- 1 Maintenance modes occur when the standby SPE is taken out of standby mode to perform a maintenance or SAT requested function. Unlike the busyout and down modes, being in maintenance mode implies this SPE can be returned to standby mode when the requested activity is completed, assuming there are no faults in the standby SPE complex. The active SPE could be either active or selected when the standby SPE is in one of the Maintenance modes.
- 2 The standby SPE is placed in down mode when a fault occurs in the standby SPE complex that would prevent that SPE from performing system functions. Down mode is always associated with STBY-SPE alarms and errors. The active SPE could be either active or selected when the standby SPE is in one of the Down modes.

status trunk

This command displays internal software state information for diagnosis and can help locate facilities to which the trunk is communicating. If a trunk group number is entered without a member number, a list showing the status for each member in the specified group displays. If a both the trunk group and member numbers are entered, the status for only the specified member is displays.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status trunk	group	Administered group number (1 - 99). If group number entered without a member number, a list showing the status of each member in the group displays.	init inads craft cust rcust	none	none
	member	Administered member number within a trunk group (1 - 99)	bcms browse		
	print	Report sent to printer. Examples: status trunk 78 status trunk 80 status trunk 78/1 status trunk 80/2 status trunk 80/2 print			

Output

Group/member

The following example shows the output for the **status trunk 78/1** (trunk group/member) command.

```
status trunk 78/1

                                TRUNK STATUS

Trunk Group/Member: 078/001      Service State: in-service/idle
                          Port: 01C1505      Maintenance Busy? no
Signaling Group ID:              CA-TSC State:
Connected Ports:
```

Field descriptions (group/member)

Trunk Group/Member	Trunk group number/group member number (1-99/1-99)
Port	Port location (cabinet-carrier-slot-circuit)
Signaling Group ID	If trunk is ISDN, then this field displays the number of the ISDN Signaling Group to which this group belongs; otherwise, the field is blank.
Connected Ports	Port locations (cabinet-carrier-slot-circuit) connected to the trunk
Service State	Trunk service state: in-service/active, in-service/idle, out-of-service-NE, out-of-service-FE, maint-NE/active, maint-FE/active, maint-NE/idle, and maint-FE/idle. NE (Near End; switch) and FE (Far End; PRI terminal adapter or any device that terminates the D-channel signaling) refer to which "end" of the B-channel has placed the facility in the current state.
Maintenance Busy	Whether any maintenance testing is being performed
CA-TSC State	State of the temporary signaling connection (used to pass call information over PRI signaling links)

Group only

The following example shows the output from the **status trunk 78** (trunk group only) command.

```
status trunk 78
```

TRUNK GROUP STATUS

Member	Port	Service State	Mtce Connected Ports Busy
078/001	01C1505	in-service/idle	no
078/002	01C1506	in-service/idle	no

Field descriptions

Member	Trunk group number/group member number (1-99/1-99).
Port	Port location (cabinet-carrier-slot-circuit)
Service State	Trunk service state: in-service/active, in-service/idle, out-of-service-NE, out-of-service-FE, maint-NE/active, maint-FE/active, maint-NE/idle, and maint-FE/idle. NE (Near End; switch) and FE (Far End; PRI terminal adapter or any device that terminates the D-channel signaling) refer to which "end" of the B-channel has placed the facility in the current state.
Mtce Busy	Whether any maintenance testing is being performed
Connected Ports	Port locations (cabinet-carrier-slot-circuit) connected to the trunk

status tsc-administered

The `status tsc-administered` command displays the operational status of TSC's administered for an administered signaling group. The status represents the state of the TSC according to switched services.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status tsc-administered	<i>signaling group</i>	Administered signaling group number	init inads craft	none	none
	<i>#/tsc index</i>	Number associated with each TSC in a signaling group			
	<i>print</i>	Report sent to printer Examples: status tsc-administered 1 status tsc-administered 1/1 status tsc-administered 1/2 print			

Output

The following example shows the output for the **status tsc-administered 1/1** command.

```
status tsc-administered 1/1
```

```
ADMINISTERED NON-CALL-ASSOCIATED TSC STATUS
```

```
TSC      TSC
Index   State      Establish  Enabled   Congested
1        inactive   as-needed  yes       no
```

Field descriptions

TSC Index The administered TSC index (1-64).

TSC State State of the administered TSC:

- **inactive**: the administered TSC is not functioning (for example, D-channel out-of-service, or disabled)
- **active**: indicates that the administered TSC is up and user information can be exchanged end-to-end.
- **pending-inactive**: shows that the TSC is being released.
- **pending-active**: the TSC is about to come up

- Establish The switch responsible for the origination of the administered TSC:
 - *as-needed*: TSC is established on an as needed basis
 - *permanent*: TSC is permanently established

- Enabled Indicates if the administered TSC's have been enabled ("yes" or "no").

- Congested Administered TSC congestion history (whether or not the network can handle the receipt of USER INFORMATION messages for the administered TSC):
 - *yes*: TSC is congested
 - *no*: TSC is not congested
 - *clear*: TSC congestion was cleared during its active period

status tti

This command displays the status (active/not active) of the tti background maintenance task, and, if it is active, it displays whether tti ports are being generated or removed, the number of tti-supported boards that have processed, and the number of tti-supported boards that have not yet been processed. The display also includes the elapsed time since the background maintenance task started.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
status tti	<i>print</i>	Report sent to the printer Examples: status tti status tti print	init inads craft cust nms browse	none	TTI background maintenance task is activated by enabling the TTI system parameter on the System-parameters Features form.

Output

The following example shows the output for the **status tti** command.

```

status tti                                     Page 1 of 1

                                     TTI STATUS

TTI Background Task State:  generating tti ports
                             TTI State:  voice
# of Boards Completed:     30
# of Boards Left to Process: 120
                             Percent Complete: 25
Elapsed Time since Task Started: 0:15
    
```

Field descriptions

TTI Background Task State:	State of the tti background maintenance task: <ul style="list-style-type: none">■ generating tti ports:■ removing tti ports:■ suspended:■ not active:■ completed - all ports translated: the last execution of the background task completed normally■ completed - some ports not translated: the task completed due to resource exhaustion with some ports left untranslated
TTI State:	The tti state: displays <code>off</code> (TTI feature not enabled for the system), or if enabled, then the field displays what kind of tti ports are being generated or removed (<code>voice</code> , <code>data</code>).
# of Boards Completed:	Number of TTI-supported boards that have been processed by the background maintenance task: <ul style="list-style-type: none">■ <code>completed</code>: board has either had all its unadministered ports translated as TTI ports or its TTI ports have been removed and are now unadministered ports. This depends on whether the TTI background task is generating or removing tti ports.
# of Boards Left to Process:	Number of TTI-supported boards that have not yet been processed by the background maintenance task.
Percent Complete:	Ratio of the of number of boards completed compared to the number of boards left to process.
Elapsed Time since Task Started:	Elapsed time since the TTI background task was started. If the task is "not active", then this field is blank. If the task is "completed" it indicates the length of time (<code>hh:mm</code> format) it took to complete the task. If the task is "suspended", then it displays the elapsed time at the point the task was suspended.

test access-endpoint

This command performs hardware diagnostic tests on all port circuits that are associated with the specified access endpoint extension.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test access-endpoint	extension	Access endpoint extension (# of digits determined by dial-plan)	init inads craft nms	Test sequence = short; repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive test series (includes a destructive test)			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test access-endpoint 25012 test access-endpoint 45002 sh test access-endpoint 45892 l test access-endpoint 24389 sh r 4 test access-endpoint 34899 l r 6 test access-endpoint 34912 l r 5 schedule test access-endpoint 93483 r 2 test access-endpoint 10022 c test access-endpoint 92349 schedule			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output for the **test access-endpoint 22502** command, and assumes the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6. The responses are displayed on a port-by-port and test-by-test basis with one line of data for each test result.

```
test access-endpoint 22502 short                page 1 of 1

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C1101   WAE-PORT            22502     36       PASS
01C1102   WAE-PORT            22502     36       PASS
01C1103   WAE-PORT            22502     36       PASS
01C1104   WAE-PORT            22502     36       PASS
01C1105   WAE-PORT            22502     36       PASS
01C1106   WAE-PORT            22502     36       PASS

Command Successfully Completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object (wideband access endpoint = WAE-PORT; single port access endpoint = TIE-DS1)
Alt. Name	The extension number of the access endpoint
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test alarms

This command allows automatic testing all of the hardware associated with the active alarms in the alarm log. This command provides an initial query form to help the user narrow the selection of alarmed objects. After submitting the query form, the system tests the hardware associated with the selected alarm log entries. The results display in standard test output and status information display on the message line as the command progresses.

Several alarms may be logged against a single maintenance object, each alarm representing a different problem. Even if there are multiple entries in the alarm

log for a single object, the **test alarms** command only tests each physical object once.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test alarms	auto-page	New screen displays when current screen fills ¹	init inads craft nms	Test sequence = short; repeat = 1	See below
	failures	Only the failures (hardware, aborts, conflicts, EPN-down) display			
	step	Allows "stepping" to the next or previous alarm (current alarm not tested) ²			
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive test series (includes a destructive test)			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ³			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ⁴ Examples: test alarms test alarms step failures test alarms long clear auto-page test alarms long failures			

1 If **auto-page** option is not specified, the screen does not refresh once filled, and testing stops until the user presses PAGE (continue) or CANCEL (halts testing).

2 Press CANCEL to abort the command, ENTER to test the currently displayed alarm, NEXT ALARM (function key) to move to the next alarm, and PREV ALARM (function key) to move to the previous alarm without testing the currently displayed alarm. If this option is entered, then the NEXT ALARM (function key) or PREV ALARM (function key) can be pressed at any time during the command, even during test results. If NEXT ALARM or PREV ALARM is pressed during a test, the test is aborted, testing of the current alarm stops, and the next or previous alarm displays. If the first alarm is displayed and PREV ALARM is pressed, then the last alarm is displayed. If the last alarm is currently displayed and the NEXT ALARM is requested, then the first alarm displays. The only way to terminate this command is to press CANCEL.

3 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNINGS BELOW.

4 Refer to the Report Scheduler and System Printer feature specification for more details.

**WARNING:**

Executing a clear with short option may not clear all alarms, even if all tests pass.

**WARNING:**

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Feature Interactions

With the enhancement of multiple maintenance users, there may be a possibility of two users attempting to test the same physical hardware (for example, one using the **test alarms** command and another using the **test board** command). If this command attempts to test a board that is currently being tested by another user, a error message displays.

Options form

After entering the **test alarms** command, you are presented with an options form for alarm selection.

```
test alarms repeat 1
```

```
HARDWARE TEST ALARM QUERY

Field descriptions (Hardware Test Alarm Query)

Alarm Types	The type of alarm to be tested: put y or n in the field(s) to selects one or a combination of alarms.
Interval	Tests alarms for the last hour (h), last day (d), last week (w) or all (a) [default].
From	Test alarm from the specified time specified (<i>mm/dd/hh/mm</i>). If no <code>from</code> date is entered, then no checking is done and the alarms active since a month prior to the current time are reported.
To	Test alarms associated with records to the specified time specified (<i>mm/dd/hh/mm</i>). If no <code>to</code> date is entered, any alarm active after the <code>from</code> date is selected.
Equipment Type	<p>The technician can choose between five different equipment types. If there is no input to any of these fields, the system defaults to all the equipment. The user can select one of the following fields:</p> <ul style="list-style-type: none">■ Cabinet: tests alarms associated with a particular cabinet (1-3).■ Port Network: tests all alarms associated with a particular port network (1-3).■ Board Number: tests all alarms associated with a particular circuit pack (PCss, default cabinet = 1).■ Port: tests all alarms associated with a particular port on a circuit pack (PCsspp, default cabinet = 1).■ Category: Alarms for a particular equipment category■ Extension: Alarms associated with an extension number■ Trunk (group/member): tests all alarms associated with a particular trunk group or trunk group member, <i>XXYY</i>, where the group identifier tests all alarms associated with a trunk group (<i>XX_</i>), and the group identifier <i>and</i> member identifier are both entered to test all alarms associated with a specific trunk group member (<i>XXYY</i>).

Output

The following example shows the output from the **test alarms** command (query form left empty by pressing ENTER). The responses display on a test-by-test basis with one line of data for each test result.

```

test alarms                                     Page 1

Testing completed for this object.

press CANCEL to quit -- press NEXT PAGE to continue

Field descriptions

When encountering errors in preparing a particular object to be tested (not inserted, contention, etc.), an error message display in the TEST RESULTS section of the output form.

ALARM ENTRY section

Port	Port location of alarmed object (cabinet-carrier-slot-circuit); same identifier as alarm log
Maintenance Name	The name of the maintenance object
On Board	Fault detected is on the associated circuit pack (y) or off board (o).
Alt Name	Terminal extension numbers or trunk group numbers
Alarm Type	Major, Minor, or Warning
Service State	Current service state of the station and trunk ports: RDY (ready for service), OUT (out of service), or IN (in service).
Ack	Whether alarm has been acknowledged by the first and second OSS telephone numbers, respectively.

Date Alarmed Day, hour, and minute of alarm.
 Alarm Count Count of the current alarm entry versus the total number of alarms to be tested.

Test results section

Port Port address (cabinet-carrier-slot-circuit)
 Maintenance Name The name of maintenance object
 Alt. Name Alternate way to identify maintenance objects.

If the Object is The field contains

station	extension
trunk	xxx/yyy (where xxx = trunk group number and yyy = member number)
private CO line	P/xxx (where xxx = private CO line group number)

Test No The test being executed
 Result Test result: Fail, Pass, Abort, or No Board. If this field has conflict, another user may be testing this hardware. If this field has epn-down, the epn is inaccessible at this time.
 Error Code Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test analog-testcall

The test analog-testcall command performs facility diagnostic tests on an entire trunk group, an individual trunk group member, an individual trunk port or on all trunks on a board, depending on the options entered. The type of test call, the far-end test line number, and the various other parameters must be administered on the trunk group form before executing the command. Normally, the user should only invoke the full or supervision test. The other options are provided primarily for testing when setting up an ATMS schedule.

8 Maintenance Commands and Trouble-Clearing Aids
test analog-testcall

8-343

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test analog-testcall	full	Executes the most comprehensive test call available using the administered test set type.	init inads craft cust	Test sequence = long; repeat = 1	See below
	no supervision	Executes a supervision-only test call (approx. 10 sec.) and confirms the presence of the test set at the far end.			
	no-selftest	Executes the "full" test (skips any self-test sequences), saving about 20 seconds on the type 105 transmission test and has no effect on type 100 or 102 transmission tests.			
	no-return-loss	Executes the "full" test (skips any return loss sequences), saving about 20 seconds on the type 105 transmission test and does not have any effect on type 100 or 102 transmission tests.			
	no-st-or-rl	Executes the "full" test (skips all self test and return loss sequences), saving about 40 seconds on the type 105 transmission test and does not have any effect on type 100 or 102 transmission tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: test analog-testcall trunk 78 f test analog-testcall trunk 78 f schedule test analog-testcall trunk 80/1 s r 2 test analog-testcall trunk 80/1 s r 2 schedule test analog-testcall trunk 78/2 no-selftest r 10 test analog-testcall trunk 78/2 no-selftest r 10 schedule test analog-testcall trunk 78 r 4 test analog-testcall trunk 78 r 4 schedule test analog-testcall port 2a1505 no-st-or-rl r 4 test analog-testcall port 2a1505 no-st-or-rl r 4 schedule test analog-testcall board 2a15 test analog-testcall board 2a15 schedule test analog-testcall port 2a1505 no-return-loss test analog-testcall port 2a1505 no-return-loss schedule te an t 80 te an t 80 schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

- Additional data is available after running a test. See the [“list measurements”](#) command with the **test-call** option for details on how to access the additional data.
- If the trunk is in use by call processing, the test aborts.
- If the trunk is in use by maintenance, the test queues and runs when the current maintenance activity finishes.

Output

The following example shows the output for the **test analog-testcall trunk 78** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test analog-testcall trunk 78
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C1505	CO-TRK	78/1	845	PASS	
01C1507	CO-TRK	78/2	845	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Alternate way to identify maintenance objects.
	If the Object is The field contains
	trunk xxx/yyy (where xxx = trunk group number and yyy = member number)
Test No.	The test being executed
Result	Test result: Pass, Fail, Abort, Disabled, No Board, or Extra Board.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test board

This command performs a set of hardware diagnostic tests on a specified circuit pack. The system first validates that the board exists at the specified location. Then, based on the logical type of board (for example, Analog, Digital, Hybrid, and others), a series of tests perform diagnostics on the board and then returns results of the test along with any possible error codes. Some of the tests can be disabled by administering forms on the administration terminal.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test board	<i>location</i>	Physical location of the board PCSS	init inads craft nms	Test sequence = short; repeat = 1	none
	<i>short</i>	Option for a brief series of nondestructive diagnostic tests.			
	<i>long</i>	Option for a longer, more comprehensive test series (includes a destructive test)			
	<i>repeat number</i>	How many times each test in the sequence is repeated (1-100)			
	<i>clear</i>	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test board 01c11 l test board 01c11 l schedule test board 02e15 sh r 2 test board 01c08 test board 02d12 r 4 test board 02d12 c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

Destructive long tests on a Switch Node Interface (SNI) board are not allowed unless the board has first been busied out.

Output

The following example shows the output from the **test board 1c07 short** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test board 01C07 short
```

P/xxx (where xxx = private CO line group number)

Test No The test being executed

Result Test result: Pass, Fail, Abort, Disabled, No Board, or Extra Board.

Error Code Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test card-mem

This command executes a sequence of tests on the memory card in the specified switch processor element. The test sequences in order for both long and short options are listed in the following table:

Test	Short	Long
12 Volt Power Supply Test (#701)	X	X
Memory Card Insertion Test (#695)	X	X
Memory Card Format and Read Test (#696)	X	X
Memory Card Match Test (#697)	X	X
Memory Card Write-Protected Test (#698)	X	X
Memory Card Directory Recovery Test (#699)	X	X
Memory Card Translation Data Integrity Test (#694)		X
Memory Card Erase/Write/Read Test (#693)		X
Memory Card Capacity Test (#1014)		X
Flash Data Consistency Test (#421)		X ¹

1 The "Flash Data Consistency Test" is not executed in simplex systems.

These tests verify the sanity of the memory card device, the basic read/erase/write operations to the memory card, the integrity of the translation data stored in the memory card, the function of 12 volt power supply in TN777B NETCON circuit pack used for memory card erase/write operations, the translation capacity of the memory card, and the consistency of data stored in both memory cards in a High or Critical Reliability system. This command can also help troubleshoot the following hardware errors: CARD-MEM, 12V-PWR, CAP-MEM, and FL-DATA.

8 Maintenance Commands and Trouble-Clearing Aids
test card-mem

8-348

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test card-mem	location	Carrier location where memory card resides: High or Critical Reliability (a or b) ¹ ; duplicated (a , A , b , or B)	init inads craft	Test sequence = short; repeat = 1	See below
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive test series (includes a destructive test)			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ²			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ³ Examples: test card-mem test card-mem a l test card-mem b sh r 2 test card-mem a sch test card-mem a c			

- 1 Carrier location required on command line
- 2 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.
- 3 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" option clears all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Feature Interactions

The **test card-mem long** command invokes the Memory Card Erase/Write/Read Test. This means that the **save translation** and **save announcement** commands are rejected while the write-to-memory-card operation is active. This test also

invokes the Memory Card Capacity Test which determines whether the memory card is more than 98% full. This test is also invoked after the **save translation** command.

In a High or Critical Reliability System, running **test card-mem** command for a memory card in the standby SPE means that the standby SPE is put into the maintenance mode and no SPE interchange is allowed through the **reset system interchange** command or scheduled SPE interchange.

Output

The following example shows the output from the **test card-mem a long** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test card-mem a long                               SPE A

                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code

Field descriptions

Port Port address (cabinet-carrier-slot-circuit): cabinet 1, carrier is **A** (control carrier A in a simplex system) and either **A** or **B** (control carriers A and B in a duplex system). The slot and circuit fields in the port address for the 12V-PWR, CAP-MEM, and CARD-MEM maintenance objects are always blank. The port address for maintenance object FL-DATA is blank.

8 Maintenance Commands and Trouble-Clearing Aids
test card-mem

8-350

Maintenance Name	The name of maintenance object being tested: <ul style="list-style-type: none">■ CARD-MEM for the memory card■ 12V-PWR for 12-volt power supply in TN777B NETCON board■ CAP-MEM for memory card capacity■ FL-DATA for the data consistency stored in memory cards (duplicated switch)
Test No	The test being executed
Result	Test result: Pass, Fail, or Abort
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test cdr-link

This command first validates that the Call Detail Recording (CDR) link has been administered and exists in the switch. Then individual diagnostic tests run on the link and return results of the test along with any possible error codes. For information on what a CDR link is and does, see the description in "[status cdr-link](#)" section of this manual.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test cdr-link	<i>link-id</i>	Link-id = primary or secondary	init inads craft	Test sequence = short; repeat = 1	none
	<i>short</i>	Option for a brief series of nondestructive diagnostic tests.			
	<i>long</i>	Option for a longer, more comprehensive test series (includes a destructive test)			
	<i>repeat number</i>	How many times each test in the sequence is repeated (1-100)			
	<i>clear</i>	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test cdr-link primary l test cdr-link secondary sh r 2 test cdr-link primary test cdr-link secondary test cdr-link secondary c test cdr-link primary schedule			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output for the **test cdr-link primary** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test cdr-link primary short
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
	PRI-CDR		215	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	Not applicable (always blank)
Maintenance Name	The type of MO being tested: primary cdr-link= PRI-CDR; secondary cdr-link = SEC-CDR
Alt. Name	Not applicable (always blank)
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, Disabled
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test customer-alarm

This command performs hardware diagnostic tests on the leads of the Processor and EPN maintenance circuit packs, used for customer-provided alarms by closing the appropriate relay for 1 minute. Failure is verified by checking the customer alarm attached to the specified circuit pack.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test customer-alarm	location	Extension of the data module or data channel to be tested (per dial-plan)	init inads craft	See below	none
	short	Runs test number 115			
	long	Runs test number 115 (same as short test option)			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ²			
		Examples: test customer-alarm test customer-alarm schedule test customer-alarm 02 r 2 test customer-alarm 01b r 25 test customer-alarm 01b r 25 schedule test customer-alarm 2a test customer-alarm 2a sh test customer-alarm 01b l schedule test customer-alarm 3 c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Defaults

The default cabinet is cabinet 1. The default carrier is carrier "a," except for SPE duplex system PPNs. In this case the carrier has no default and either "a" or "b" must be entered. The default for the remaining parameter is a repeat of 1.

Output

The following example shows the output from the **test customer-alarm 02a** command.

```
test customer-alarm 02A

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
02A       CUST-ALM              115       PASS

Command Successfully Completed
```

Field Definitions

Port	The port address (cabinet-carrier-slot)
Maintenance Name	The maintenance name (always CUST-ALM)
Alt. Name	Not applicable
Test No.	The test number (always 115)
Result	Test result: Pass, Abort, or Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test data-module

This command performs hardware diagnostic tests on a data module or data channel. Test results are determined by the interface to the digital switch-data line port, digital line port, or network control data channel.

8 Maintenance Commands and Trouble-Clearing Aids
 test data-module

8-355

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test data-module	extension	Extension of the data module or data channel to be tested (per dial-plan)	init inads craft cust nms	Test sequence = short; repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive test series (includes a destructive test)			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test data-module 30000 l test data-module 30000 test data-module 32000 sh r 2 test data-module 33000 l r 25 test data-module 33000 l r 25 schedule test data-module 30000 c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following example shows the output from the **test data-module 300** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test data-module 300
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C1103	PDMODULE		17	PASS	

```
Command successfully completed
```

Field Definitions

Maintenance Name The name of maintenance object

Alt. Name Alternate way to identify maintenance objects.

If the Object is The field contains

station extension

trunk xxx/yyy (where xxx = trunk group number and yyy = member number)

private CO line P/xxx (where xxx = private CO line group number)

Test No The test being executed

Result Test result: Pass, Fail, Abort, No Board

Error Code Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test ds1-loop

This command validates that the board exists at the specified location and that the board is a TN464F or TN767E or later suffix DS1 Interface board. Long-duration loopback tests execute for an extended period of time until manually terminated. Short-duration loopback tests return the result of the test to the screen after executing. The **list measurements ds1 summary** command can be used to monitor the status of a long-duration loopback/span test.

8 Maintenance Commands and Trouble-Clearing Aids
test ds1-loop

8-357

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test ds1-loop	location	Physical location of board (PcSS)	init inads craft super-user other ³	ds1/csu-loopback-tests	See below
	cpe-loopback-jack-test-begin	Long-duration loopback test setup through the Customer Premises Equipment (CPE) Loopback Jack. Allows user to specify a loop-up code for the CPE loopback jack if it differs from the default (0x47F). The loop-up code is entered by specifying the number of bits in the loop-up code as well as the actual hexadecimal bit-pattern. ¹			
	far-csu-loopback-test-begin	Long-duration loopback test setup through the far-end Channel Service Unit (CSU)			
	one-way-span-test-begin	Long-duration one-way span test			
	end-loopback/span-test	Terminates long-duration one-way span and loopback testing			
	inject-single-bit-error	Single bit error sent within an active framed 3-in-24 test pattern used in long-duration loopback and span testing			
	ds1/csu-loopback-tests	Sequentially executes the following loopback tests: DS1 Board LoopBack, CSU Module Equipment LoopBack, and CSU Module Repeater LoopBack. ² Examples: test ds1-loop 01c08 test ds1-loop 1-3c03 cpe-loopback-jack test ds1-loop 1-3c03 cpe test ds1-loop 10c03 end test ds1-loop 02d12 fa test ds1-loop 02d12 inj			

1 For TN464F or TN767E or later suffix DS1 boards only. The test aborts if the board has not been taken out of service with the **busyout** command.

2 For TN464F or TN767E or later suffix DS1 boards

3 Logins with `Maintain Switch Circuit Packs` permissions enabled.

Feature Interactions

- Loopback or span tests are not allowed on DS1 boards unless the board has been busied out.
- Only one of the CPE Loopback Jack, far-end CSU, one-way span, or DS1/CSU loopback tests may be active at any given time on a DS1 span.

Output

The following example shows the output for the **test ds1-loop 1c07** command, and assumes that the board in cabinet 1, carrier c, slot 7 is a TN767E DS1 board. The responses display on a test-by-test basis with one line of data for each test result.

```
test ds1-loop 01C07 ds1/csu-loopback-tests
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C07	DS1-BD		1209	PASS	
01C07	DS1-BD		1210	PASS

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object
Alt. Name	The alternate means of identifying the maintenance object.
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, or Extra Bd
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test duplication-interface

This command performs hardware diagnostic tests on the indicated duplication interface circuit pack, under the control of the active SPE that tests the SHDW-CIR, SPE-SELECT, and DUPINT maintenance objects.

- SHDW-CIR is associated with that portion of the duplication interface circuit pack that handles memory shadowing from the active to the standby SPE
- SPE-SELECT is associated with the SPE Select switch located on the front of the circuit pack
- DUPINT is associated with the duplication interface circuit packs other functions, including SPE-to-SPE communication, SAT connection, and environmental maintenance leads.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test duplication-interface	location	SPE location of the duplication interface circuit pack (1a, 1b, a, or b)	init inads craft	Text sequence = short; repeat = 1	Duplication-interface failures may prevent SPE switching.
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive test series (includes a destructive test)			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test duplication-interface a test duplication-interface b sh test duplication-interface a l r 25 test duplication-interface 1b l r 25 schedule test duplication-interface 1a l c			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output from the **test duplication-interface 1A** command, where A is the active carrier in an SPE duplex system. The responses display on a test-by-test basis with one line of data for each test result.

```
test duplication-interface a long                               SPE A

                                TEST RESULTS

Command Successfully Completed

Field Definitions

Port	The port address (cabinet-carrier); always 01A or 01B
Maintenance Name	Always SHDW-CIR, SPE-SELE, or DUPINT.
Alt. Name	Not applicable
Test No.	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, or Disabled
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test eda-external-device-alm

This command performs a hardware diagnostic test on all or specific port's administered external device alarms. The test **PASSES** if the external device *is not* reporting an external device alarm and **FAILS** if the external device *is*

8 Maintenance Commands and Trouble-Clearing Aids
test eda-external-device-alm

8-361

reporting an external device alarm. If you are entering a specific port, it must already be administered as an external device alarm port on a maintenance or an analog line port carrier board.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test eda-external-device-alm	physical location	In addition to the word physical , you must enter the physical location (PCSSpp for an administered external device alarm analog line port). ¹	init inads craft	Repeat = 1	none
	all	Tests all administered external device alarm ports on analog line and maintenance boards.			
	repeat	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ²			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ³ Examples: test eda-external-device-alm all test eda-external-device-alm all schedule test eda-external-device-alm physical 1major r 10 test eda-external-device-alm physical 2c1101 c			

1 Since the "maintenance board" alarm connections connect to control carrier boards that are in unnumbered slots, the standard port format cannot be used to designate these alarm connections. The special ports **Pmajor** and **Pminor** are used designate the major or minor maintenance board alarm connection for cabinet **P**. The major/minor designation specifies the pair of wires, *not* the alarm level associated with the connection (the "major" port can be administered as a major, minor or warning alarm and the "minor" port can be administered as a major, minor or warning alarm).

2 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

3 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output for the **test external-device-alarm all** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test eda-external-device-alm all
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code

04major	EXT-DEV	unknown	120	FAIL	

```
Command successfully completed
```

Field definitions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object
Alt. Name	The alternate means of identifying the maintenance object, in this case, the administered (descriptive) name of the external device alarm.
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, or Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test environment

This command performs hardware diagnostic tests of the environment monitoring and control, and emergency transfer functions of both Processor Port Network (PPN) cabinets and Expansion Port Network (EPN) cabinets. Circuit packs involved are the Processor circuit pack (PPN simplex systems), the Duplication Interface circuit pack (PPN duplex systems), and EPN Maintenance circuit packs. The tone/clock circuit pack is involved in tests of the ring generator.

There are 8 Maintenance Objects involved in this testing:

1. DC-POWER tests power availability, battery charging and temperature functions in SCC cabinets only.
2. EMG-XFER tests emergency transfer status
3. EXT-DEV tests external (AUDIX, for example) alarm status for both the SCC and MCC cabinet systems.
4. POWER tests battery backup
5. AC-POWER tests AC power availability
6. CARR_POW tests carrier DC power availability. The long test of CARR_POW includes a power recycle test for non-Processor Element (SPE) carriers and is destructive. There is one instance of CARR_POW for each carrier in the cabinet.
7. CABINET tests air flow and temperature
8. RING_GEN tests ringing voltage are tested in MCC cabinets only.

NOTE:

The processor carrier and its duplicate if present as well as any EPN control carrier or an SCC carrier is not recycled. All port carriers are recycled, and service is interrupted for each port carrier. If a carrier containing an active EI is recycled, communications with that cabinet is disrupted. If a carrier containing an active tone-clock board is recycled, all ports in the cabinet or port network are service disrupted.

8 Maintenance Commands and Trouble-Clearing Aids
test environment

8-364

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test environment	location	Cabinet (1-3); 1 = PPN, 2-3 = optional EPN.	init inads craft	Cabinet = 1; test sequence = short; repeat = 1	See below
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test environment test environment schedule test environment 1 sh test environment 1 l r 25 test environment 01 l r 25 test environment 01 l r 25 schedule test environment 2 l c test environment 3 c			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The long test recycles power in some specified cabinet on non-SPE and maintenance board carriers and is destructive. Specifically, the 'a' carrier of PPNs and EPNs does not have power recycled. In PPNs containing duplicated SPEs the 'b' carrier also does not have power recycled. All port carriers are recycled, and service is interrupted for each port carrier. If a carrier containing an active EI is recycled, communication with that cabinet is disrupted. If a carrier containing an active tone-clock board is recycled, all ports in the cabinet or port network are service disrupted.

Output

The following example shows the output for the **test environment 1** command to test a MCC/PPN cabinet. The responses display on a test-by-test basis with one line of data for each test result.

```
test environment 1
```

TEST RESULTS

test hardware-group

This command allows a user to perform a set of hardware diagnostic tests on the whole system, a carrier, cabinet, spe, or board. The tests vary according to the configuration of the system and the specified command options.

This command runs a series of tests on all the hardware on the entire system, an individual carrier, cabinet, spe, or board. The tests vary depending on options chosen and board types. Each test exercises diagnostics on all the hardware in the specified hardware group and reports results of the test along with any possible error codes. Concurrent testing is done to enhance performance, therefore, test results display on the SAT in the order they are received. Consequently, test results of one maintenance object may be intermixed with test results of other maintenance objects.

Because the tests for this command are not destructive, the tests performed on a particular maintenance object with either the **short** or the long **option** may not be the same as the corresponding demand tests.

A hardware-group command executing in the foreground may be cancelled by either pressing the CANCEL key or by entering the **cancel hardware-group** command at a different SAT. However, if the technician wants to cancel a **test hardware-group** command running in the background, the **cancel hardware-group** command can be entered on any SAT. A canceled **test hardware-group** command can be resumed at the point it left off by entering the **resume hardware-group** command. Restarts are not allowed for **test hardware-group** commands entered with either the **all-ports** option or the **spe-interchange** option.

8 Maintenance Commands and Trouble-Clearing Aids
 test hardware-group

8-367

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test hardware-group	system	System-wide test of all hardware-groups	init inads	Test sequence = short; repeat = 1	See below
	carrier location	Carrier address: cabinet (1-3), carrier (A-E) ¹			
	cabinet location	Cabinet address (1-3) ²			
	board location	Board address in PCSS format ³			
	print	Output sent to printer			
	schedule	Command validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ⁴			
		Examples: test hardware-group system test hardware-group system print test hardware-group carrier 1a test hardware-group carrier 1a schedule test hardware-group cabinet 2 test hardware-group board 01c07 test hardware-group board 01c07 schedule test hardware-group spe test hardware-group spe print test hardware-group spe schedule			

- 1 The type of carrier may be port, or processor. In the case of a port carrier, all universal port and tone-clock boards (see reference 4) and its affiliated MOs residing in the specified carrier are tested. For a processor carrier, all SPE complex and tone-clock boards and its affiliated MOs are tested.
- 2 All PN and PNC related MOs plus cabinet specific MOs, including maintenance boards and environment (ring generator, battery, power, emergency transfer, external alarms, fans, and temperature) are tested if they reside in the specified 'cabinet location'.
- 3 All MOs on the specified 'board location' including ports are tested.
- 4 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

test hardware-group Only one **test hardware-group** command can be active at any given time.

TTI	If the test hardware-group command is issued with the all-ports option when the TTI background task is active, some unadministered ports may not be tested. In addition, active alarms on line ports may be cleared by this task. The status tti command can be used to determine the state of the TTI background task.
Add Station	If a add station command is entered for an untranslated port at the same time as it is being tested as part of the test hardware-group command with the all-ports option, the error message, <code>Object in use; please try later</code> displays, and the request fails.
Trunk administration	If an attempt is made to add an unadministered trunk port to a trunk group at the same time as it is being tested as part of the test hardware-group with the all-ports option, the error message, <code>Object in use; please try later</code> displays, and the request fails.
Save translation	If the test hardware-group with the all-ports option while a translation save operation is active, some unadministered ports may not be tested. All other hardware are tested normally.
Hardware alarms	When a hardware error is detected by the test hardware-group command, the hardware goes through the standard escalation strategy. Alarms are raised on hardware that manifest 'hard' errors. This alarming strategy is the same, regardless of whether the ports are translated or not.
System interaction	The performance of test hardware-group is affected by call processing traffic, administration activity, choice of the short or long option, whether the all-ports option is chosen, whether the spe-interchange option is chosen, and other demand maintenance activity.
Scheduled and periodic maintenance	While executing the test hardware-group command, all scheduled background maintenance, periodic background maintenance, and data audits activity is suspended until the command completes. When the test hardware-group command is canceled or completes, all suspended periodic, scheduled, and data audits background maintenance activity are restarted where it left off.

Setting the Test Parameters

Once the user has entered the desired action (**test hardware-group**) and the object (board, carrier, etc.), then an options form displays.

```
test hardware-group system                               Page 1 of 1
```

SPE-interchange? n

Field descriptions

Test sequence	Short (nondestructive) or long (more comprehensive, still nondestructive) test sequence
Test Repetition	repeat - (1-99) each test is executed the number of times specified on each physical object. continuously -all tests on all the specified hardware run until cancelled by either pressing the CANCEL key or by executing the cancel hardware-group command.
count :	Repeat test sequence value (1-99). If the Test sequence field is set to continuously , then this field disappears from the screen; if this field is set to repeat , then the field appears.
Auto-page?	Provides a new screen every time the SAT screen fills with test results. (n / y). The screen does not scroll to accommodate new results; instead a new screen is provided after the current screen fills up. If the auto-page option is not selected, the SAT screen does not refresh once it is filled, and testing stops until the user enters the PAGE key to continue or the CANCEL key to cancel the testing. This option is not allowed if the background option is selected.

Background? Run the command in the background, thus freeing the SAT (*n / y*). The error results are tabulated in the error log, but no results display on the terminal.

This option cannot be used if either the **continuously** or the **auto-page** options are selected.

Failures? Only failing test results display (*n / y*). Test results that pass or abort are not displayed. The **failures** option has no effect if entered with the **background** option.

All-ports? Tests all customer translated line and trunk ports as well as a set of untranslated line and trunk ports for boards listed in [Table 8-8](#) (*n / y*).

Table 8-8. Test of 'all ports' option for the following boards:

Board Number	Description	Board Number	Description
TN413	Digital Line	TN746	16 port Analog Line
TN417	Auxiliary Trunk	TN747B	Central Office Trunk

TN742	8 port Analog Line	TN2180	16 port Analog line

SPE-interchange? Allow for planned interchange of duplicated SPEs and subsequent testing of both the active and standby SPEs.

Output

The following example shows the output for the **test hardware-group system** command and assumes that the board in port network 1, carrier c, slot 7 is an analog board with three administered ports and test sequence repeat = 3. Responses to this command running in the foreground display on a test-by-test basis with one line of data for each test result.

```
test hardware-group system
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C07	ANL-BD		51	PASS	
01C07	ANL-BD		52	PASS	
01C0703	ANL-LINE		35	PASS	
01C0702	ANL-LINE		35	PASS

8 Maintenance Commands and Trouble-Clearing Aids

test inads-link

8-372

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object
Alt. Name	Alternate way to identify maintenance objects.
If the Object is The field contains	
	station extension
	trunk xxx/yyyy (where xxx = trunk group number and yyy = member number)
	private CO line P/xxx (where xxx = private CO line group number)
Test No.	The test being executed
Result	Test result: No Board, Extra Bd, Disabled, or Skipped
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

The following example shows the output for the **test hardware-group system** with the **background** option selected.

```
test hardware-group system  
  
Command started in background mode
```

test inads-link

This command attempts to make a call over the inads port on the maintenance board to verify the INADS alarm notification process. In the default settings, the system test the link to the first OSS telephone number. If there is an alarm pending to be reported or the call is in progress or up, then the test aborts. If the alarm origination to the OSS telephone number to be tested is disabled, then the test generates an informative error and the test continues. The test waits 2 minutes before dialing the call to allow the remote maintenance technician to logoff, thus freeing the line. A *local* SAT user entering the **test inads-link** command does not need to log off for the system to place the call, but the two-minute delay still exists.

Once the call is answered by INADS, the system sends a message with a test alarm type. INADS acknowledges receipt of the message and creates a trouble ticket. The trouble ticket is closed immediately and has a "INADS LINK TEST" message entered in the description field. If an alarm is raised while the test call is up, the system does not send an alarm message over the existing link. The

8 Maintenance Commands and Trouble-Clearing Aids
test inads-link

8-373

normal retry mechanism is followed, which means an attempt to make a call to INADS to report the error takes place 7 minutes later. An INADS trouble ticket is created only if the connection is successfully established and a message is sent to the system acknowledging that INADS received the system message.

The `Maintain Process Circuit Packs` field must be set to **yes** on the `inads` and technician permission forms. This provides permissions to execute the **test inads-link** command. This field can be changed by executing a **change permission login** command.

No alarms are raised on the system and attendant alarm and acknowledgment lamp states are not changed as a result of the **test inads-link** command. The test does not run during periodic or scheduled maintenance.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test inads-link	1	First OSS telephone number	init	1st OSS number	none
	2	Second OSS telephone number Examples: test inads-link test inads-link 1 test inads-link 2	inads craft nms		

Output

Command successfully completed

Test passed

Command failed

Link was up, there was an active alarm that the switch needs to report, or there was a problem with the call.

NOTE:

An entry is made in the error log describing why the `inads-link` test failed.

test interface

This command performs hardware diagnostic tests on the specified processor interface circuit pack. In addition to testing the PI board, the tests examine the protocol and link interface that is transmitted over the board.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test interface	location	Location (cabinet-carrier-position) of the processor interface (position 1 = first processor interface in the carrier, 2 = second)	init inads craft nms	Test sequence = short; repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test interface 01a1 l test interface 01b2 s r 2 test interface 01b2 s r 2 schedule test interface b1 l r 25 test interface a2			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following example shows the output for the **test interface a1** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test interface a1
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01A1	PI-SCI		231	PASS	
01A1	PI-BD		52	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	Port address: cabinet-carrier-slot (the carrier associated with the particular processor interface board)
Maintenance Name	The name of maintenance object
Alt. Name	Not applicable.
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, or Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test isdn-testcall

This command starts an outgoing, asynchronous ISDN-PRI test call in the asynchronous method from a specified trunk. If the test results are PASS, the test call is started. A test result of ABORT means that a resource wasn't available, for example, B-channel or a Maintenance/Test circuit pack. A test result of FAIL denotes that the outgoing ISDN-PRI test call was not established.

8 Maintenance Commands and Trouble-Clearing Aids
test isdn-testcall

8-376

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test isdn-testcall	group number	The administered group number associated with each trunk group	init inads craft	duration = 8.4 or 9.6 sec	See below
	member number	The administered member number identifying a particular trunk within a trunk group.			
	minute number	Duration of the test call in minutes (1-120)			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: test isdn-testcall 80/1 test isdn-testcall 80/1 schedule test isdn-testcall 78/2 minutes 10 test isdn-testcall 78/3 minutes 100 schedule			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

- Use the **status isdn-testcall** command for details on how to access the additional data available after running the test.
- Only one ISDN trunk can be tested per port network at a time. Once testing is completed, another ISDN trunk can be tested in that port network.
- The maximum number of asynchronous outgoing test calls running depends upon the number of Maintenance/Test circuit packs in the system.

Output

The following example shows the output for the test **isdn-testcall 80/1** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test isdn-testcall 77/1                               SPE A

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01B1501   ISDN-TRK           077/001   258      PASS

Command Successfully Completed
```

Field descriptions

Port	Port address: cabinet-carrier-slot-circuit
Maintenance Name	The name of the maintenance object being tested.
Alt. Name	Alternate means of identifying the maintenance object: trunk object xxx/yyy, where xxx = trunk group number, yyy = member number
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, or Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test journal-printer

This command performs hardware diagnostics on the link between the switch and one of the specified journal printer links. There are two types of journal printer links: pms-log and wakeup-log. For general information on journal printer links, see the second paragraph in the “Description” section of the “busyout pms-link” manual pages. For information on what a journal printer is and does, see the second paragraph in the [“Output”](#) section of the [“status journal-link”](#) manual pages.

8 Maintenance Commands and Trouble-Clearing Aids
test journal-printer

8-378

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test journal-printer	pms-log	Tests the link to the pms logging printer (maintenance name = PMS-PRNT)	init inads craft	Test sequence = short; repeat = 1	See below
	wakeup-log	Tests the link to the wakeup logging printer (maintenance name = JNL-PRNT)			
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test journal-printer pms-log l test journal-printer pms-log l schedule test journal-printer wakeup-log r 2 test journal-printer wakeup-log r 2 schedule test journ pm r 3 test journ pm r 3 schedule			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The maintenance of a particular component on a link sometimes interferes with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component due to the maintenance test of a component only taking place when the component is idle. Therefore, the

technician needs to be able to disable the attempted re-setup of a link. Use of the busyout command causes the link to be torn down. If the link is already down, the busyout command stops periodic re-setup tries on the link.

Output

The following example shows the output for the **test journal-printer pms-log** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test journal-printer pms-log short

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
JRNL-LINK                215       PASS

Command Successfully Completed
```

Field descriptions

Port	Not applicable (always blank)
Maintenance Name	The name of maintenance object being tested: PMS-PRINT for testing the pms-log printer link JNL-PRNT for testing the wakeup-log printer link
Alt. Name	Not applicable (always blank)
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, Disabled
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test led

This command performs a test on all the LEDs in a specified cabinet. Once the cabinet is validated and the range of circuit packs determined, the **test led** command turns on all LEDs on the circuit packs contained in each carrier until all affected carriers are lit. Once all the LEDs are on, there is a 2-second pause, and then all the LEDs are turned off in the same order. Once all of the repeat cycles are completed, all affected LEDs are restored to the current status.

On a duplex PPN, only the long option tests the leds in the standby SPE. When executing the **test led long** command, the standby Processor, Memory, and Packet Control circuit pack LEDs can take up to 20 seconds to light.

The following LEDs are NOT lighted by the **test led** command:

- SPE Select LEDs on the Duplication Interface Circuit Packs
- Power Unit LEDs
- Yellow (amber) LED on the tape drive

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test led	all	All LEDs in all carriers are tested	init inads craft	all; repeat = 1; test sequence = short in a duplex system	none
	cabinet number	Cabinet number (each carrier tested sequentially)			
	short	Simplex: short and long option are identical and turn on and off all leds in the specified port network. Duplex: short option does <i>not</i> affect the leds in the standby SPE carrier in the PPN.			
	long	Simplex: short and long option are identical and turn on and off all leds in the specified port network. Duplex: long option <i>does</i> affect the leds in the standby SPE carrier in the PPN.			
	repeat number	Number of times each test in the sequence is repeated (1-100) Examples: test led test led all r 2 test led cabinet 1 test led c 1 test led 1 long			

Output

If the command is successful, `Command successfully completed` displays.

test link

This command validates that a specified link is administered and then performs a set of hardware diagnostic tests on the link.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test link	link-id	Link number (1-8; assigned via the communication-interface links form)	init inads craft	Test sequence = short; repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test link 1 test link 1 schedule test link 3 l test link 2 sh test link 2 r 2 test link 2 l c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following example shows the output for the test link 1 long command. The responses display on a test-by-test basis with one line of data for each test result.

```
test link 1 long

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01AXX01   PI-LINK              182        PASS
01AXX01   PI-LINK              183        PASS
01AXX01   PI-LINK              234        PASS
01AXX01   PI-LINK              233        PASS

Command Successfully Completed
```

Field descriptions

- Port Port address on the Processor Interface board associated with the link-id being tested.
- Maintenance Name The name of maintenance object being tested
- Alt. Name Not applicable.
- Test No The test being executed
- Result Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
- Error Code Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test maintenance

This command tests the EPN maintenance circuit pack in any Expansion Port Network control carrier. Specifying cabinets 2 - 3 allows testing of any connected EPN maintenance circuit packs. The test sequence checks the SAT interface, EI

link, reset, and sanity functions on the EPN maintenance circuit pack. The long test resets the EPN maintenance circuit pack, causing the EPNSAT link to be dropped and is destructive.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test maintenance	location	Physical location of the maintenance circuit pack: (2-3)	init inads craft	Test sequence = short; repeat = 1	See below
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test maintenance 2 test maintenance 3 schedule test maintenance 2 sh test maintenance 2 l c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The last test in the long test sequence on EPN maintenance circuit packs drops the EPNSAT link.

Output

The following example shows the output for the **test maintenance 2** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test maintenance 2
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
02A	MAINT		106	PASS	
02A	MAINT		229	PASS	
02A	MAINT		303	PASS	
02A	MAINT		337	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	The port address (cabinet-carrier) of the maintenance object that is being tested. For this maintenance object, only the cabinet and carrier values display.
Maintenance Name	The maintenance name (always MAINT)
Alt. Name	Not applicable.
Test No.	The test being executed
Result	The result of the individual test: Pass, Abort, Fail, Disabled
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test memory

This command performs hardware diagnostic tests on any or all memory circuit packs in the specified carrier. Both short and the long test are nondestructive when testing memory.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test memory	location	Physical location of the memory circuit pack: cabinet number (optional, but always 1 if entered) and carrier letter (either a or b for duplex, a for simplex)	init inads craft nms	See below	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive test series (all nondestructive for this command).			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test memory test memory a test memory a schedule test memory 1a2 test memory b1 sh test memory b l r 25 test memory a l c			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Defaults

The cabinet default is always 1. For SPE simplex systems, the default carrier is the "a" carrier; for SPE duplex systems, there is no default carrier. The defaults for the remaining parameters are short with a repeat of 1.

Output

The following example show the output for the **test memory 1b** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test memory 1b
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01B	MEM-BD		87	PASS	
01B	MEM-BD		631	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	The port address (cabinet-carrier)
Maintenance Name	The name of maintenance object being tested is MEMORY.
Alt. Name	Not applicable.
Test No.	The test being executed
Result	The result of the test: Pass, Abort, or Fail
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test modem-pool

This command performs hardware diagnostic tests on the specified modem pool group or an individual member of a specified group (Combined or Integrated). A Combined modem-pool group consists of pairs of Analog and Digital Line ports. One pair of Analog and Digital Line ports used for modem-pooling is called a conversion resource. An Integrated group consists of modem-pool circuit packs, each containing two conversion resources. Therefore, when a member number is specified for a Combined modem-pool group, one conversion resource is tested, and when a member number is specified for an Integrated modem-pool group, two conversion resources are tested.

8 Maintenance Commands and Trouble-Clearing Aids
test modem-pool

8-387

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test modem-pool	group number	The administered group number (1-5)	init inads craft	Test Sequence = short; repeat = 1	none
	member number	The administered member number (1-32). A member is a pair of analog and digital line ports (two pair for the Integrated modem-pool).			
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test modem-pool 1 test modem-pool 1 schedule test modem-pool 1/3 l r 2 test modem-pool 1/3 l r 2 schedule test modem-pool 2 r 2 test modem-pool 2 l			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following example shows the output for the test modem-pool 1/3 command. The responses display on a test-by-test basis with one line of data for each test result.

```
test modem-pool 1/3 short                               SPE B

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C0701   MODEM-PT                98         PASS
01C0701   MODEM-PT                99         PASS

Command Successfully Completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object (always MODEM-PT)
Alt. Name	Not applicable
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test network-control

This command performs hardware diagnostic tests on a specified network control circuit pack.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test network-control	location	Network control board carrier location in a High or Critical Reliability System (a or b).	init inads craft	Cabinet 1, carrier a, test sequence repeat = 1.	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	Number of times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test network-control test network-control a l test network-control b sh r 2 test network-control b l r 25 test network-control a test network-control a c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following example shows the output from the **test network-control a** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test network-control a
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01A	DATA-BD		52	PASS	
01AXX01	DATA-CHL	4001	109	PASS	
01AXX01	DATA-CHL	4001	110	PASS	
01AXX01	DATA-CHL	4001	111	PASS	
01A	SW-CTL		95	PASS	
01A	SW-CTL		92	PASS	
01A	SW-CTL		94	PASS	
01A	SW-CTL		324	PASS	
01A	12V-PWR		701	PASS	
01A	CARD-MEM		695	PASS	
01A	CARD-MEM		696	PASS	
01A	CARD-MEM		697	PASS	
01A	CARD-MEM		698	PASS	
01A	CARD-MEM		699	PASS	

```
Command Successfully Completed
```

Field descriptions

Port Port address: cabinet (always 1)-carrier-slot-circuit. For the DATA-BD, SW-CTL, 12V-PWR, and CARD-MEM maintenance objects, the `slot` and `circuit` fields of port address are blank. DATA-CHL (administered data channel) uses `xx` as the slot address and has a circuit number between 01 and 04. The carrier field has a value `A` for the control carrier A in a simplex system, and `A` or `B` for control carriers A and B in a duplex system.

Maintenance Name The name of the maintenance object:

- DATA-BD for Network Control board
- SW-CTL for Switch Control Archangel
- DATA-CHL for administered data channel
- 12V-PWR for 12 volt power supply unit on the Network Control board
- CARD-MEM for flash memory card on Network Control board
- 12V-PWR and CARD-MEM (shown only when the Network Control board is TN777B)

8 Maintenance Commands and Trouble-Clearing Aids
test network-control

8-391

Alt. Name	Extension number of the DATA-CHL, if administered. For other maintenance objects, this field is not applicable and, therefore, empty.
Test No	The test being executed.
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test packet-control

This command performs hardware diagnostic tests on the specified packet-control circuit pack.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test packet-control	location	Applies only to duplicated configurations: if simplex, parameter is not used and thus is not valid; if duplicated, "location" represents the carrier in which the packet-control resides (1A or 1B).	init inads craft nms	Simplex: location optional, cabinet=1, carrier A. Duplex: cabinet=1, no default for the carrier.	See below
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test packet-control test packet-control A test packet-control B test packet-control 1A test packet-control 1B test packet-control a short test packet-control a s repeat 5 test packet-control b s r 5 test packet-control b long clear test packet-control b l r 25			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The reset packet-control test (#586) does not run on the active packet-control. This test is part of the standby packet-control test sequence, illustrated in the screen output section below.

Output

The following example is the screen output for the **test packet-control 1B long** command. Note that carrier B is the active carrier in this example.

```
test packet-control 1B 1
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01B	PKT-CTRL		583	PASS	
01B	PKT-CTRL		584	PASS	
01B	PKT-CTRL		585	PASS	

```
Command successfully completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object.
Alt. Name	Not applicable
Test No.	The test number run on the packet-control.
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test pkt

The test pkt runs a series of tests on the Packet bus of the specified PPN or EPN.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test pkt port-network	pn number	The Packet bus to be tested: <i>nn</i> (1-3)	init inads craft	Test Sequence = short; Repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test pkt port-network 1 l test pkt port-network 2 sh r 2 test pkt port-network 2 sh schedule test pkt port-network 1 l r 25 test pkt port-network 2 test pkt port-network 1 c			

- 1 If no alarms are registered against the maintenance object, then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the **clear long** options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following example is the output for the test pkt port-network 1 command. The responses display on a test-by-test basis with one line of data for each test result.

```
test pkt port-network 1
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
PN 01	PKT-BUS		571	PASS	
PN 01	PKT-BUS		572	PASS	
PN 01	PKT-BUS		573	PASS	

```
Command successfully completed
```

Field descriptions

Port	A port network number (1-3).
Maintenance Name	The name of maintenance object being tested.
Alt. Name	Not applicable.
Test No	The test being executed.
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test pms-link

This command performs the specified property management system link tests on the specified pms link by checking to see if the link is accessible and then performing a reset on the link (long test only). For general information on PMS

links, refer to the description of the [“busyout pms-link”](#) command. For information on what a PMS is and does, refer to the description of the [“status pms-link”](#) command.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test pms-link	short	Option for a brief series of nondestructive diagnostic tests.	init inads craft	Test Sequence = short; Repeat = 1	See below
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test pms-link sh r 5 test pms-link l test pms-link test pms-link c test pms-link c sch			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Feature Interactions

The maintenance of a particular component on a link may interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The **busyout** command is used to do this and causes the link to be torn down. If the link is already down, the **busyout** command stops periodic re-setup tries on the link.

Output

The following example shows the output for the **test pms-link long** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test pms-link long
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
	PMS-LINK		214	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	Always blank
Maintenance Name	Always PMS-LINK
Alt. Name	Not applicable.
Test No	The test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test port

This command performs hardware diagnostic tests on an individual port circuit. In most cases, tests are performed on hardware connected to the port.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test port	location	PCSSpp	init inads craft	Test Sequence = short; Repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ²			
		Examples: test port 01c1101 l test port 01c1101 l schedule test port 02e1502 sh r 2 test port 02d1201 r 4 test port 01c1101 c			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following example is the output for the **test port** command and assumes that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The responses display on a test-by-test basis with one line of data for each test result.

```
test port 01c0701 short
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C0701	ANL-LINE		35	PASS	
01C0701	ANL-LINE		48	PASS	
01C0701	ANL-LINE		36	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	Port address (cabinet-carrier-slot-circuit)
Maintenance Name	The name of maintenance object.
Alt. Name	The alternate means of identifying the maintenance object.
	If the Object is a The field contains
	station extension
	trunk xxx/yyy (xxx = trunk group number and yyy = member number)
	private CO line P/xxx (xxx = private CO line group number)
Test No	Test being executed.
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test pri-endpoint

This command performs hardware diagnostic tests on all port circuits (B-channels) that are associated with the PRI endpoint extension.

The test pri-endpoint command performs hardware diagnostic tests on all port circuits (B-channels) that are associated with the specified PRI endpoint.

8 Maintenance Commands and Trouble-Clearing Aids
test pri-endpoint

8-400

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test pri-endpoint	extension	PRI endpoint extension to be tested (must conform to dial-plan)	init inads craft nms	Test Sequence = short; Repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test pri-endpoint 25012 test pri-endpoint 45002 sh test pri-endpoint 45892 l test pri-endpoint 24389 sh r 4 test pri-endpoint 34899 l r 6 test pri-endpoint 34912 l r 5 schedule test pri-endpoint 93483 r 2 test pri-endpoint 10022 c test pri-endpoint 92349 schedule			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following output example is for the test pri-endpoint 22501 command and assumes that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuits 1 to 3. The responses display on a port-by-port and test-by-test basis with one line of data for each test result.

```
test pri-endpoint 22501 short                                page 1 of 1

                                TEST RESULTS

Port      Maintenance Name  Alt. Name Test No. Result      Error Code
01B2001   PE-BCHL            22501    36      PASS
01B2001   PE-BCHL            22501    255     PASS
01B2001   PE-BCHL            22501    256     PASS
01B2001   PE-BCHL            22501    257     PASS
01B2002   PE-BCHL            22501    36      PASS
01B2002   PE-BCHL            22501    255     PASS
01B2002   PE-BCHL            22501    256     PASS
01B2002   PE-BCHL            22501    257     PASS
01B2003   PE-BCHL            22501    36      PASS
01B2003   PE-BCHL            22501    255     PASS
01B2003   PE-BCHL            22501    256     PASS
01B2003   PE-BCHL            22501    257     PASS
```

Command Successfully Completed

Field descriptions

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The maintenance object name for the PRI endpoint port is PE-BCHL.
Alt. Name	The specified extension number of the PRI endpoint.
Test No	The actual test being executed.
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test processor

This command performs hardware diagnostic tests on a specified processor circuit pack.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test processor	location	Cabinet number (optional for simplex) and carrier letter (optional a for simplex; a or b for duplex).	init inads craft	See below	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test processor test processor schedule test processor a test processor 1a test processor b sh test processor a l c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Defaults

For SPE simplex systems, the location is optional and defaults to cabinet 1, carrier a. For SPE duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier. Defaults for the remaining parameters are short with a repeat of 1.

Output

The following output example is for the test processor a command. The responses display on a test-by-test basis with one line of data for each test result.

```
test processor a                               SPE B

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01A       PROCR                77         PASS
01A       PROCR                80         PASS
01A       PROCR                82         PASS
01A       PR-MAINT             102        ABORT      1018
01A       PR-MAINT             103        ABORT      1018
01A       PR-MAINT             106        PASS
01A       PR-MAINT             228        PASS
01A       PR-MAINT             229        ABORT      1018
01A       MEMORY               87         PASS
01A       MEMORY               631        PASS

Command successfully completed
```

Field descriptions

Port	The port address (cabinet-carrier) of the maintenance object that is being tested.
Maintenance Name	Maintenance object being tested is MEMORY.
Alt. Name	Not applicable.
Test No.	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test shadow-link

This command performs hardware diagnostics for the shadow link between the two duplication-interface circuit packs. This command works only with High or Critical Reliability systems. Refer to [Chapter 6, "Reliability Systems: A Maintenance Aid"](#) for more details.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test shadow-link	<i>short</i>	Both the short and long test sequence execute only Test #318.	init inads craft	Test Sequence = short; Repeat = 1	none
	<i>long</i>				
	<i>repeat number</i>	How many times each test in the sequence is repeated (1-100)			
	<i>clear</i>	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ²			
		Examples: test shadow-link l test shadow-link sh r 2 test shadow-link sh r 2 schedule test shadow-link c			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following output example is for the **test shadow-link** command. The responses display on a test-by-test basis with one line of data for each test result.

8 Maintenance Commands and Trouble-Clearing Aids
test shadow-link

8-405

```
test shadow-link
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
	SHDW-LNK		318	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	The port address is always blank.
Maintenance Name	The maintenance name is always SHDW-LNK for this command.
Alt. Name	Not applicable.
Test No	The test number is always 318.
Result	Test result: Pass, Abort, Fail, Disabled
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test signaling-group

This command validates that the specified signaling group is administered and runs a series of diagnostic tests that return results of the test along with possible error codes. A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test signaling-group	group identifier	The station extension (must conform to dial-plan)	init inads craft	Test Sequence = short; Repeat = 1	See below
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test signaling-group 1 test signaling-group 1 repeat 10 test signaling-group 2 short test signaling-group 4 long test signaling-group 4 long clear test signaling-group 2 schedule			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Feature Interactions

Additional data is available after running a test. See the **status signaling-group** command for how to access the additional data.

Output

The following output example is for the **test signaling-group 1** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test signaling-group 1                               SPE A

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
1         ISDN-SGR              636       PASS
1         ISDN-SGR              639       PASS
1         ISDN-SGR              637       PASS

Command Successfully Completed
```

Field descriptions

Port	The signaling group number (1-8) of the signaling group that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not Applicable.
Test No	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test sp-link

The **test sp-link** command validates that the system printer link is administered and runs a series of diagnostic tests that return results of the test along with possible error codes.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

8 Maintenance Commands and Trouble-Clearing Aids
 test sp-link

8-408

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test sp-link	short	Option for a brief series of nondestructive diagnostic tests.	init inads craft	short	none
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹ Examples: test sp-link test sp-link sh test sp-link l test sp-link schedule test sp-link sh sch			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following output example is for the **test sp-link** command. The responses display on a test-by-test basis with one line of data for each test result.

```

test sp-link                               SPE A

                                     TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
SYS-PRNT
SYS-PRNT
                                     215       PASS
                                     213       PASS

Command Successfully Completed
    
```

Field descriptions

Port	Not applicable. Always blank.
Maintenance Name	The name of maintenance object.
Alt. Name	Alternate means of identifying the maintenance object. This field contains the extension when the object is a data module.
Test No	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test spe-standby

This command allows the technician to perform hardware diagnostic tests on the standby Switch Processing Element (SPE) in a duplex SPE system. This command tests all MOs in the standby MO. The STBY-SPE MO itself does not have any defined tests. Instead, tests are run on the following MOs when the **test spe-standby** command is run.

MEMORY	DUPINT	PROCR	FL-DATA
SHDW-LNK	DATA-BD	PR-MAINT	PI-BD
SHDW-CIR	DATA-CHL	12V-PWR	PI-PT
SPE_SELEC	SW-CTL	CARD-MEM	PKT-CTRL

Refer to these MOs for more details. This command is only for a High or Critical Reliability systems.

Action/ Object	Qualifiers	Qualifier Description	Permissions	Defaults	Feature Interactions
test spe-standby	short	Option for a brief series of nondestructive diagnostic tests.	init inads craft	Test Sequence = short; Repeat = 1	See below
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹ Examples: test spe-standby long test spe-standby l test spe-standby s r 2 test spe-standby c			

¹ If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

Feature Interactions

Testing the standby SPE maintenance object makes the standby SPE unavailable to take over for the active SPE.

Output

The following output example for the **test spe-standby** command assumes that the standby SPE is located in carrier B. The responses display on a test-by-test basis with one line of data for each test result.

```
test spe-standby                               SPE A

                                     TEST RESULTS

Port      Maintenance Name Alt. Name Test No. Result      Error Code
01B      SHDW-CIR                285      PASS
01B      SHDW-CIR                284      PASS
01B      SPE-SELECT              278      PASS
01B      DUPINT                  315      PASS
.         .                        .         .
.         .                        .         .
.         .                        .         .

Command Successfully Completed
```

Field descriptions

Port	The port address: cabinet-carrier-slot-circuit
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Alternate means of identifying the maintenance object. This field contains the extension when the object is a data module.
Test No	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test station

This command performs hardware diagnostic tests on an individual port circuit assigned to that extension. The technician must specify the extension and a translation is automatically done to the physical port location.

8 Maintenance Commands and Trouble-Clearing Aids
 test station

8-412

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test station	extension	The station extension (must conform to dial-plan)	init inads craft cust nms	Test Sequence = short; Repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test station 81709 l test station 85136 s r 2 test station 85036 l r 25 test station 85036 l r 25 schedule test station 84297 r 4 test station 81709 c			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence. SEE WARNING BELOW.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Output

The following screen is an example of the output from the **test station 81902 short** command with the assumptions that port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port and extension 81902 is connected to that port. The responses display on a test-by-test basis with one line of data for each test result.

```
test station 81902 short
```

TEST RESULTS

Field descriptions

Port	The port address: cabinet-carrier-slot-circuit
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Alternate means of identifying the maintenance object. This field contains the extension when the object is a station.
Test No	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test synchronization

This command updates all the boards with the correct synchronization source and parameters. The system sends a downlink message to the tone clock, DS1, and Expansion Interface boards to place them in the correct synchronization configuration, providing error-free digital communication between the switch and other PBXs, COs, or customer premise equipment.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test synch	<i>short</i>	Option for a brief series of nondestructive diagnostic tests.	init inads craft	Test Sequence = short; Repeat = 1	none
	<i>long</i>	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	<i>repeat number</i>	How many times each test in the sequence is repeated (1-100)			
	<i>clear</i>	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test synchronization r 3 test synchronization sh r 1 test synchronization sh r 1 schedule test synchronization l			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The responses display on a test-by-test basis with one line of data displayed for each test result. The following screen is an example of the output for the **test synchronization short** command.

```
test synchronization short
```

```
TEST RESULTS
```

Maintenance Name	Maintenance object name
Alt. Name	Not applicable
Test No.	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test tdm

This command tests all the time slots on a bus associated with a PPN or an EPN.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test tdm	<i>pn number</i>	<i>nn</i> = number of the port network to have its TDM bus tested. Both halves ("a" and "b") of the TDM bus are tested.	init inads craft	Test Sequence = short; Repeat = 1	none
	<i>short</i>	Option for a brief series of nondestructive diagnostic tests.			
	<i>long</i>	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	<i>repeat number</i>	How many times each test in the sequence is repeated (1-100)			
	<i>clear</i>	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	<i>schedule</i>	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test tdm port-network 1 l test tdm port-network 2 sh r 2 test tdm port-network 2 sh sch test tdm port-network 1 l r 25 test tdm port-network 2 test tdm port-network 1 c			

1 If no alarms are registered against the maintenance object then the test sequence is run only once. The ***long clear*** option forces a clear of all alarms if no errors are encountered during testing. The ***short clear*** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following screen is an example of the output for the **test tdm port-network 1** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test tdm port-network 1
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
PN 01A	TDM-BUS		294	PASS	
PN 01A	TDM-BUS		296	PASS	
PN 01A	TDM-BUS		297	PASS	
PN 01B	TDM-BUS		294	PASS	
PN 01B	TDM-BUS		296	PASS	
PN 01B	TDM-BUS		297	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	For TDM-BUS maintenance object the port network number and the bus (A or B) is displayed.
Maintenance Name	Maintenance object name
Alt. Name	Not applicable.
Test No	Test being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, Extra Bd.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test tone-clock

The test tone/clock command performs hardware diagnostic tests on a technician-specified tone or clock circuit pack.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test tone-clock	location	PCSS	init inads craft	Test Sequence = short; Repeat = 1	none
	short	Option for a brief series of nondestructive diagnostic tests.			
	long	Option for a longer, more comprehensive series of both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test tone-clock 01a l test tone-clock 01b l schedule			

- 1 If no alarms are registered against the maintenance object then the test sequence is run only once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.
- 2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The responses display on a test-by-test basis with one line of data for each test result. The following is the output for the **test tone-clock 1a** command.

```
test tone-clock 1a
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01A	TONE-BD		46	PASS	
01A	TONE-BD		52	PASS	
01A	TONE-PT		40	PASS	
01A	TONE-PT		41	PASS	
01A	TDM-CLK		148	PASS	
01A	TDM-CLK		149	PASS	
01A	TDM-CLK		150	PASS	
01A	TDM-CLK		151	PASS	
01A	TDM-CLK		574	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	The port address: cabinet-carrier-slot-circuit
Maintenance Name	Maintenance object name: TONE-BD, TONE-PT, and TDM-CLK.
Alt. Name	Not applicable.
Test No	Test being executed
Result	Test result: PASS, ABORT, FAIL, NO BOARD, DISABLED, EXTRA BD.
Error Code	Numeric code explaining why the release failed or aborted. Refer to the detailed list of the codes by test number for each MO.

test trunk

This command performs hardware diagnostic tests on an entire trunk group or an individual trunk group member, depending on the options entered.

Action/ Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test trunk	group number	Administered group number (1-99)	init inads craft cust	Test Seq. = short; Repeat = 1	none
	member number	Administered number identifying a particular trunk within a trunk group (1-99).			
	short	Command executes a series of nondestructive diagnostic tests.			
	long	Command executes a more comprehensive and longer version of the both destructive and nondestructive diagnostic tests.			
	repeat number	How many times each test in the sequence is repeated (1-100)			
	clear	This option causes the test sequence (short or long) to repeat until the alarm (if any) is cleared or a single test in the sequence fails. ¹			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ² Examples: test trunk 78 l test trunk 80/1 sh r 2 test trunk 78/2 l r 25 test trunk 78/2 l r 25 schedule test trunk 80 test trunk 80 schedule test trunk 78 r 4 test trunk 78 c			

1 If no alarms are registered against the maintenance object then the test sequence exercises once. The **long clear** option forces a clear of all alarms if no errors are encountered during testing. The **short clear** option only clears alarms pertinent to tests in the short sequence.

2 Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The responses display on a test-by-test basis with one line of data for each test result. The following screen is an example of the output for the **test trunk 78** command.

```
test trunk 78
```

```
TEST RESULTS
```

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
01C1505	CO-TRK	078/001	3	PASS	
01C1505	CO-TRK	078/001	36	PASS	

```
Command Successfully Completed
```

Field descriptions

Port	The port address: cabinet-carrier-slot-circuit
Maintenance Name	The name of maintenance object being tested.
Alt. Name	The alternate means of identifying the maintenance object. If the object is a trunk, the field contains xxx/yyy (where xxx = trunk group number, yyy = member number). If the object is a private CO line, the field contains P/xxx (where xxx = private CO line group number).
Test No	The test number being executed
Result	The result of the individual test: PASS, ABORT, FAIL, NO BOARD, DISABLED, and EXTRA BD.
Error Code	A system-generated number indicating the reason that the test for the named MO failed or aborted.

test tsc-administered

This command submits a switched services request to run the Temporary Signaling Connection's heartbeat test for all administered TSCs on a signaling group.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
test tsc-administered	signaling group number/	Signaling group number (1–8)	init inads craft	repeat = 1	Additional data available after running the test. See status tsc-administered for how to access additional data.
	tsc index	The number associated with each TSC in a signaling group.			
	repeat number	The number of times each test in sequence is repeated.			
	schedule	Command is validated and then a scheduling form displays to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. ¹			

¹ Refer to the Report Scheduler and System Printer feature specification for more details.

Output

The following is an example of the output from the **test tsc-administered 1/1** command. The responses display on a test-by-test basis with one line of data for each test result.

```
test tsc-administered 1/1
```

TEST RESULTS

Port	Maintenance Name	Alt. Name	Test No.	Result	Error Code
1/1	TSC-ADM		604	PASS	

```
Command Successfully Completed
```

Field descriptions

Port

Port address of the administered temporary signaling connection
 (format = *signaling group no./tsc index*)

Maintenance Name	The name of the maintenance object
Alt. Name	Not applicable
Test No.	The test number being executed
Result	Test result: Pass, Abort, Fail, No Board, Disabled, or Extra Bd.
Error Code	A system-generated number indicating the reason that the test for the named MO failed or aborted.

upgrade software

This command upgrades the software text image, the flash component of the LMM firmware, the MTP firmware, the Packet Control (PACCON), and the Processor Interface (PI) firmwares. Depending on whether the system is simplex (Standard reliability) or Duplex (High or Critical reliability), the processes for the upgrade are different:

System	Description of Upgrade
Simplex (Standard reliability)	The command verifies that a software card-mem is present and then, if present, proceeds to reprogram the flash memory and perform a level-4 restart. During the restart of the system, the system technician is prompted to replace the software card-mem with the translation card-mem. Service is provided upon completion of the system restart. Service down time is 5-12 minutes.
Duplex (High or Critical reliability)	The command verifies that a software card-mem is present in the standby SPE, programs the flash memory, resets the standby SPE, and prompts the system technician to replace the software card-mem with the translation card-mem. An interchange of SPEs is performed upon completion of a successful standby upgrade. At the same time, the old active SPE is upgraded automatically with the new software through similar swapping of card-mems. The service disruption time is 1-4 minutes.

WARNING:

Be sure to save translations before this executing this command. It may also be helpful to read the Feature Interactions for this command before upgrading the system software.

Action/Object	Qualifier	Qualifier Description	Permissions	Defaults	Feature Interactions
upgrade software	none		init inads craft	none	See below

Feature Interactions

System Restarts

An upgrade causes a system restart: simplex systems perform a Level-4 restart, and duplex systems perform a Level-2 SPE-interchange after the standby is upgraded through a Level-4 restart.

Initcauses

Executing **display initcauses** shows the software upgrade and the system reset level.

Multi-User Contention

When this command is executing, all other maintenance commands are blocked. Exceptions to these are most of the status or display commands. All administration commands are not blocked. It is the user's responsibility to make sure that no new translations are added between the last **save translation** operation and the completion of the **upgrade software** command.

Recent Change History Log

The **upgrade software** command does not log for both simplex and duplex systems. This is due to the clearing of memory during the level 4 reset.

Periodic and Scheduled Maintenance

Periodic and scheduled maintenance is suspended during the upgrade.

Error and Alarm Log

Error and alarm logs before the software upgrade are lost.

Demand Busyout Objects

Maintenance objects that have been demand busyout are released when the processor reboots or interchanges during the software upgrade. If the command is cancelled before the actual reboot or interchange starts, then all demand busyout objects status are preserved.

Data Consistency between SPEs

Data consistency alarms are generated if the software in the active and standby SPE are not consistent.

Disabled Objects

All disabled objects retain their “disabled” status after a software upgrade according to the status recorded in the last **save translation** command.

Output

The following is the output from the **upgrade software** command and a successful simplex upgrade.

```
INITIATING SOFTWARE UPGRADE
MEM-CARD CHECKSUM           PASSED
REPROGRAMMING MTP          PASSED
ERASING MEMORY              PASSED
REPROGRAMMING SPE          PASSED
FLASH TEXT CHECKSUM         PASSED
UPGRADE COMPLETE
<beep>
REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD
<beep>
```

Explanations and error recoveries to the above steps follow:

INITIATING SOFTWARE UPGRADE:	The system is upgrading the software.
MEM-CARD CHECKSUM:	If the card-mem checksum fails, the system reboots without performing the upgrade. Retry the command with another software card-mem.
REPROGRAMMING MTP:	If the MTP programming fails, the Manager I does not function anymore, meaning that the rest of the upgrade (if it occurs) are not visible and the MTP will not be present to monitor the health of the processor. The only recovery procedure is to power down and power up the system, since the presence of a software card-mem will cause a software upgrade.
ERASING MEMORY:	The rest of the memory is being erased.

- REPROGRAMMING SPE: This shows the status of the reprogramming. A total of 7 Mbytes has to be reprogrammed. If the reprogramming fails in the midst of upgrade, it will take the system into *SPE-down* mode. In this mode, the system technician can only reset the system or display alarms. The system should be reset and another upgrade attempted due to the detection of a software card-mem in the system.
- FLASH TEXT CHECKSUM: If the checksum fails, the software may or may not be healthy, but it will try to run for as long as it can until further system reset through system technician intervention.
- REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD: The system technician is prompted by a beep and this text string on the Manager I to replace the software card-mem with the translation card-mem. The system boots without translation if the replacement is not done within 2 minutes. The only way to recover from this is to replace the card-mem and issue a *reset system 3* to read in the translations again.
- UPGRADE COMPLETE: The software upgrade is complete.

Packet Bus Fault Isolation and Correction

9

General

This chapter describes the fault isolation/correction procedures for the Packet Bus and for the various MOs that use the Packet Bus. Because the Packet Bus is shared by all circuit packs that must communicate on it, a faulty circuit pack can disrupt communication over the Packet Bus. In addition, a circuit pack that does not use the Packet Bus can cause service disruptions if the physical configuration of the switch is being modified (this is discussed in more detail later). For these reasons, isolating the cause of Packet Bus failure can be complicated. In this chapter, a flowchart is provided to aid in this isolation effort, as are detailed discussions of the tools and procedures used in the fault isolation and correction.

This chapter is organized into several sections that provide introductory information, as well as packet bus fault isolation and correction procedures. The sections of the chapter are as follows:

- [“Remote Maintenance versus On-Site Maintenance”](#) discusses the strategy and the requirements for performing remote maintenance and on-site maintenance for the Packet Bus.
- [“Tools for Packet Bus Fault Isolation and Correction”](#) discusses the tools that are needed to isolate and correct Packet Bus faults.
- [“Packet Bus”](#) describes the Packet Bus, its use, and the types of faults that can occur on the Packet Bus. A diagram that shows the physical and logical connections between circuit packs connected to the Packet Bus is also included.

- [“Circuit Packs That Use the Packet Bus”](#) describes the various circuit packs, ports, and endpoints that use the Packet Bus. The section discusses how these maintenance objects interact, how a failure of one maintenance object can affect another, and also the failure symptoms of these maintenance objects.
- [“Maintenance of the Packet Bus”](#) describes the Packet Bus maintenance software strategy. Similarities and differences between the Packet Bus and the TDM Bus are discussed. An overview of the Fault Isolation and Correction Procedures is also presented.
- [“The Maintenance/Test Circuit Pack \(TN771D\)”](#) discusses the use of the Maintenance/Test circuit pack in normal switch maintenance, as well as its role in Packet Bus fault isolation. The standalone mode of the Maintenance/Test (which is used to perform the Packet Bus Fault Isolation and Correction procedures on-site) is discussed in detail.
- [“Packet Bus Fault Isolation Flowchart”](#) presents a flowchart that is used to isolate a Packet Bus problem. This flowchart is the starting point for this process, and it is used to determine if a failure of service is caused by the Packet Bus itself or by another maintenance object on the Packet Bus.
- [“Packet Bus Fault Correction”](#) presents the procedures required to correct either a problem with the Packet Bus itself or one that is caused by a circuit pack connected to the Packet Bus.

The Packet Bus Fault Isolation Flowchart is intended to be the normal starting point for isolating and resolving Packet Bus problems. However, anyone who is unfamiliar with Packet Bus maintenance should read the introductory sections to gain a good understanding of the Packet Bus maintenance and the procedures involved.

Remote Maintenance versus On-Site Maintenance

Most packet bus fault isolation and repair procedures require a technician to be on-site. This is true because a packet bus failure is caused by a hardware failure of the packet bus itself or by a circuit pack that is connected to it. However, initial diagnoses can be made via use of the flowchart presented in the [“Packet Bus Fault Isolation Flowchart”](#) section of this chapter. However, before implementing the Maintenance/Test Standalone Mode Procedure (described later) and the Packet Bus Fault Correction Procedure, a technician must be on-site.

The flowchart as presented refers to the repair procedures in [Chapter 10, “Maintenance Object Repair Procedures”](#), for various MOs. When one of the decision points is reached, a remote technician can refer to the appropriate section and attempt to resolve any fault conditions. In addition, the remote technician can examine some of the other MOs on the flowchart. Keep in mind that if an MO that appears early on the flowchart fails, this failure can cause alarms with MOs that appear later in the flowchart.

The Maintenance/Test Packet Bus port (described in detail later in this chapter) can give the remote technician information about the state of the packet bus. This information can be obtained via the **status system** command and via the PKT-BUS test sequence. As described later, the Maintenance/Test circuit pack may or may not be present at a customer site, depending on system configuration. If a Maintenance/Test circuit pack is not present, one must be taken to the customer site.

In a high or critical reliability system, a Processor Interchange may resolve the packet bus problem. This operation can be done remotely, and is discussed in the [“Packet Bus Fault Correction”](#) section in this chapter.

Tools for Packet Bus Fault Isolation and Correction

The following list discusses several tools that are (or may be) required to perform Packet Bus Fault Isolation and Correction. The technician should be provided with these tools at the customer site:

- TN771 Maintenance/Test circuit pack for use in standalone mode, as well as the required connectors and cables. (Refer to the [“The Maintenance/Test Circuit Pack \(TN771D\)”](#) section in this chapter.)
- Replacement TN771 Maintenance/Test circuit pack may be needed. Conditions for requirement, and the relevant implementation steps are documented in the [“Special Precaution Concerning the TN771”](#) section in this chapter.
- Backplane pin-replacement kit may be required in the procedures described in the [“Packet Bus Fault Correction”](#) section of this chapter. If the kit is not available, replacement of a carrier may be required.

Packet Bus

Each port network has its own packet bus, and, accordingly, there is one packet bus MO in each port network. The packet bus is not duplicated, as is the TDM Bus. However, there are several spare leads on the packet bus and, in high and critical reliability systems, these spare leads are used to recover from some failures on the packet bus.

Packet Bus Usage

The packet bus carries ISDN-BRI signaling information for ISDN-BRI stations and data modules and for ASAI adjunct connections. The TN556 ISDN-BRI circuit pack is used for these connections. The SPE interface to the packet bus is the TN778 Packet Control (in high and critical reliability systems, there is one TN778 in each SPE). For systems with multiple port networks, the TN570 Expansion Interface is used to pass messages from the packet bus in one port network to

the packet bus in its neighbor. The TN771 Maintenance/Test Circuit Pack (discussed in detail later) provides packet bus maintenance testing and reconfiguration capabilities.

Packet Bus Faults

Two types of packet bus failures can occur:

- **Shorts.** A short occurs when leads on the packet bus become connected together. Such a connection can occur due to component failures on the packet bus interface of a circuit pack, a failure of the cables between carriers or the TDM/LAN terminators, or by pins being bent together on the backplane. Usually, a failure that occurs during normal operation is caused by a circuit pack failure. However, if the system configuration is being modified (for example, circuit packs are being moved), the cause of a subsequent packet bus failure is probably bent pins.
- **Opens.** An open occurs when there is a break on the packet bus such that the electrical path to the termination resistors is broken. Usually, this break is caused by a failed TDM/LAN cable or by a failed TDM/LAN terminator. The break can also be caused by a failure in the backplane of a carrier, although this is unlikely.

Shorts on the packet bus occur much more often than do opens. This is because the incorrect insertion of a circuit pack can cause leads to be shorted together. It is possible for a circuit pack to be the cause of a packet bus fault but still exhibit trouble-free operation. For example, the insertion of a TDM-only circuit pack (TN754B Digital Line) could bend the packet bus pins on the backplane. However, since the circuit pack does not communicate on the packet bus, the pack is not affected by the problem.

Packet bus faults do not necessarily cause service interruptions. However, most packet bus shorts do cause these interruptions. Depending on what leads are defective, the system may be able to recover and continue to communicate. This can be detrimental because it makes isolating the fault difficult. The Maintenance/Test circuit pack provides the capability to detect, and, in some cases, correct packet bus faults.

Packet Bus Connectivity

Various circuit packs communicate on the packet bus (see next section).

For details on ISDN-BRI and ASAI connectivity, refer to “BRI-PORT” and “BRI-SET/ASAI-ADJ” in [Chapter 10, “Maintenance Object Repair Procedures”](#). For details on Expansion Interface connectivity, refer to “EXP-INTF”.

Circuit Packs That Use the Packet Bus

Four circuit packs can use the packet bus. The following list identifies and discusses each circuit pack. An explanation of how each circuit pack assists in packet bus maintenance is also included.

⇒ NOTE:

The MOs involved with each circuit pack are listed in brackets. Documentation for each maintenance object is provided in [Chapter 10](#), "[Maintenance Object Repair Procedures](#)".

- **TN778 Packet Control** [PKT-CTRL] provides the SPE interface to the packet bus, just as the TN777 Network Control does to the TDM Bus. All traffic on the packet bus passes through the packet control.

The packet control can detect failures of certain control leads on the bus. Such failures are indicated by an inability to transmit data. The packet control can also detect data errors on the packet bus.
- **TN570 Expansion Interface** [EXP-INTF] is used to connect the PNs in the system. For systems that use the packet bus, all Port Network connections must be made with TN570 circuit packs. All packet traffic between PNs passes through a pair of TN570s (one in each port network).

The Expansion Interface can detect a subset of control lead failures (though not as many as the packet control), and it can detect many data lead failures via parity errors on received data.
- **TN556, TN2198 and TN2208 ISDN-BRI circuit packs** [BRI-BD, BRI-PORT, ABRI-PORT, BRI-SET, BRI-DAT, ASAI-ADJ] provides connections for ISDN-BRI station sets and data modules and for ASAI adjuncts. The Packet Bus is used to carry signaling information for sets and data modules. The Packet Bus passes signaling information and ASAI messages between the SPE and the ASAI adjunct. The ISDN-BRI circuit pack has the same fault detection capabilities as the TN570 Expansion Interface.
- **TN771D (or later) Maintenance/Test circuit pack** is the workhorse of packet bus maintenance. This circuit pack can detect all packet bus failures for the PN in which it resides. In High and Critical Reliability systems, the circuit pack enables the reconfiguring of the packet bus around a small number of failed leads. The TN771D circuit pack provides a standalone mode (that is, one that does not involve communication with the SPE) for inspecting the packet bus for faults. This is a critical tool for the packet bus fault correction procedures, which are described later.

Effect of Circuit Pack Failures on the Packet Bus

A failure of any of the circuit packs described in the previous section can disrupt traffic on the Packet Bus. Some failures cause actual Packet Bus failures with corresponding alarms, while others cause service outages without alarming the Packet Bus (although the failed circuit pack(s) should be alarmed).

The following list discusses the effects on the Packet Bus of a failure on each circuit pack that uses the Packet Bus.

- **TN778 Packet Control.** A failure of the Packet Control typically causes all Packet traffic in the system to fail. As a result, ISDN-BRI sets are not able to make or receive calls, and communication with an ASAI adjunct fails. A failure of the Packet Control may also cause a failure of the Packet Bus itself if the failure is on the interface circuitry. Otherwise, only the Packet Control is alarmed.

In a High or Critical Reliability system, there is one TN778 Packet Control in each SPE. If a Packet Control failure in the active SPE causes a Packet Bus disruption, performing an SPE interchange may restore service. In some cases, circuit pack failures may require that the circuit pack be replaced before service is restored.

- **TN570 Expansion Interface.** A failure of the Expansion Interface typically causes all Packet traffic in the connected EPN to fail. If the failure is on the Packet Bus interface, the Packet Bus may be alarmed as well.

In a High or Critical Reliability system, there is one EPN link in each control carrier for each EPN. If an active Expansion Interface failure causes a Packet Bus disruption, performing an Expansion Link switch may restore service. In some cases, circuit pack failures may require that the circuit pack be replaced before service is restored.

- **TN556 ISDN-BRI Circuit Pack.** A failure of the ISDN-BRI circuit pack typically causes some or all ISDN-BRI sets and data modules and/or an ASAI adjunct connected to the circuit pack to fail to function. If the failure is on the Packet Bus interface, the Packet Bus may be alarmed as well.
- **TN771 Maintenance/Test.** A failure of the Maintenance/Test may cause an incorrect indication of a packet bus failure or the inability to detect such a failure. A failure of the packet bus interface of the circuit pack may cause the packet bus to be alarmed.

A failure of the packet bus interface on any of the circuit packs discussed can cause the packet bus to be alarmed. This is true because such a failure may result in shorting packet bus leads together. This typically disrupts ALL packet bus traffic in the affected port network. A failure of the packet bus in the PPN affects packet traffic in the EPNs as well. Also, packet bus failures that do not affect all endpoints on that packet bus may occur. Therefore, a packet bus failure should not be ruled out even if some packet service is still present.

A circuit pack can fail in a manner such that it transmits bad data on the Packet Bus. If the Packet Control fails in such a fashion, all Packet traffic is disrupted (because all traffic requires the Packet Control). Likewise, such a failure on the Expansion Interface may disrupt all Packet traffic in that port network.

However, if an ISDN-BRI circuit pack fails such that it transmits bad data, all devices connected to the circuit pack fail to function. This failure may also disrupt the entire Packet Bus whenever the circuit pack tries to transmit data. Such a disruption may be indicated by Packet Bus alarms that occur and go away, intermittent failures of other Packet circuit packs, and/or interference with other connected endpoints. The failures mentioned are difficult to isolate because of their intermittent nature. In most cases, the failed circuit pack is usually alarmed, and all connected endpoints on the circuit pack are out of service until the circuit pack is replaced. These symptoms help in isolating the fault.

Maintenance of the Packet Bus

The following topics are discussed:

- Comparison between the Packet Bus and the TDM Bus
- Packet Bus Maintenance Software
- Overview of Fault Correction Procedures

Packet Bus and TDM Bus: a Comparison

Although the Packet Bus is similar to the TDM Bus in many ways, there are some important differences. For example, there are two physical TDM Busses in the switch (refer to the TDM-BUS section in [Chapter 10, "Maintenance Object Repair Procedures"](#), for more information), and one of these busses can fail without affecting the other (although half of the call-carrying capacity is lost in this case). On the other hand, there is only a single Packet Bus in the switch, and a failure of that bus can disrupt all traffic on the Packet Bus.

In High or Critical Reliability systems, the Maintenance/Test circuit pack provides Packet Bus reconfiguration capabilities. This allows the Packet Bus to remain in service with up to three lead failures. There is no corresponding facility on the TDM Bus, where the second physical TDM Bus continues to carry traffic until repairs are completed.

In addition, the system response varies according to the type of bus failure. Specifically, a catastrophic TDM Bus failure (one that affects both TDM Buses) disables ALL traffic in the system, while a catastrophic Packet Bus failure affects only Packet traffic. This means that all TDM traffic is unaffected, while all BRI and ASAI traffic does not work. The significance of this distinction depends on the customer's application. (For example, a customer whose primary application requires ASAI would consider the switch to be out of service, while a customer with a large number of Digital/Analog/Hybrid sets and a small number of

ISDN-BRI sets would probably not consider the Packet Bus failure a catastrophic problem.) The only way a Packet Bus failure can affect TDM traffic is via possible impact on system response time in a large switch due to ISDN-BRI endpoint maintenance running. This should rarely happen because the Packet Bus maintenance software is able to prevent this impact for most Packet Bus faults (see the next section).

**CAUTION:**

Since the correction procedures and some of the fault isolation procedures for the Packet Bus are highly destructive to service throughout the system (inasmuch as the procedures primarily involve removing circuit packs), particular attention must be paid to nondestructive fault isolation. Also, for the same reason, the time taken with destructive procedures must be minimized. This is the major reason that maintenance of the Packet Bus and of the Packet maintenance objects is described in such detail.

Packet Bus Maintenance Software

Packet Bus maintenance software involves the traditional set of error conditions, tests, and alarms relevant to Packet Bus faults. These are described in the PKT-BUS section in [Chapter 10, "Maintenance Object Repair Procedures"](#), and they are similar in design to the maintenance strategy for most maintenance objects.

In addition, because a Packet Bus failure can cause all BRI/ASAI endpoints in the affected Port Network (and their associated ports and circuit packs) to report failures, special care must be taken to ensure that the flood of error messages from the affected maintenance objects does not overload the system and interfere with TDM Bus traffic. When such a failure occurs, maintenance of Packet circuit packs is affected in the following manner:

- ISDN-BRI circuit pack (BRI-BD) in-line errors indicating possible Packet Bus failures are placed into the error log, but are not acted upon.
- ISDN-BRI port (BRI-PORT, ABRI-PORT) in-line errors indicating possible Packet Bus failures **are neither placed into the error log nor acted upon.**
- ISDN-BRI endpoint (BRI-SET, BRI-DAT, ASAI-ADJ) in-line error **are neither placed into the error log nor acted upon.**
- Circuit pack and port in-line errors that are not related to the Packet Bus, or that indicate a circuit pack failure, are acted upon in the normal fashion.
- Normal background maintenance (periodic and scheduled) is not affected.
- Foreground maintenance (for example, commands executed on the Manager I terminal) are not affected.

These interactions allow normal, non-Packet, system traffic to continue unaffected, and they reduce the number of extraneous entries into the

Error/Alarm Logs. If the Packet Bus failure is caused by a failed circuit pack, the circuit pack should appear in the Error/Alarm Logs, which aids in fault isolation.

The following events indicate a Packet Bus failure that requires the actions in the previous paragraph to occur:

- In-line errors that indicate a possible Packet Bus failure reported by two or more Packet circuit packs
- Packet Bus Uncorrectable report from the Maintenance/Test Packet Bus port (M/T-PKT)
- Packet Bus Interface Failure from the Packet Control (PKT-CTRL)

If such a failure occurs, this information will be available in an Error Log entry for PKT-BUS. Refer to the PKT-BUS section in [Chapter 10, "Maintenance Object Repair Procedures"](#), for more detailed information.

Overview of Fault Correction Procedures

This section gives an overview of the procedures used to (1) isolate the cause of Packet Bus faults and to (2) correct the Packet Bus faults. These procedures are applicable to High and Critical Reliability systems, and they are detailed fully later in this chapter:

1. The first procedure attempts to determine if a circuit pack that interfaces to the Packet Bus is the cause of the Packet Bus problem. The error and alarm logs are examined for entries for these circuit packs, and the normal maintenance procedures for those circuit packs are attempted.
2. If the Packet Bus problem still exists, port circuit packs (those in the purple slots) are removed to look for circuit pack(s) that have failed and/or have damaged the Packet Bus pins (a diagram of the backplane pins is provided later).
3. If the Packet Bus problem is still not resolved, the same procedure is attempted for the control complex circuit packs.
4. If the problem is still not resolved, or if the Packet Bus faults are known to have open leads, a procedure is undertaken in which the bus terminators and cables are replaced. If this does not resolve the problem, the carrier connectivity of the port network is reconfigured to attempt to isolate a faulty carrier.

The Maintenance/Test Circuit Pack (TN771D)

Description

Packet bus reconfiguration is available only in high and critical reliability systems. In such systems that use the packet bus, a Maintenance/Test is required in each port network. In other configurations (for example, Standard Systems, no packet bus use), the circuit pack is optional.

CAUTION:

All TN771 circuit packs must be of TN771D vintage or later.

Normal Packet Functionality

The Maintenance/Test Packet Bus Port provides the packet bus testing and reconfiguration capabilities. When the port is in service, the port continuously monitors the packet bus for faults (or recovery from faults), and it reports this information to packet bus maintenance.

The yellow LED on the TN771D Maintenance/Test circuit pack provides a visual indication of the state of the packet bus, as follows:

- **Blinking** at a rate of 1 per sec — the Maintenance/Test Packet Bus port cannot swap leads to correct a Packet Bus fault (that is, there are too many faults). **The Packet Bus may be unusable.** If the failures detected by the Maintenance/Test Packet Bus port are open lead failures, the Packet Bus may still be operating.
- **On steady** — the Maintenance/Test Packet Bus port has swapped leads on the Packet Bus. **The Packet Bus is still operating.**

⇒ NOTE:

Because the yellow LED on the Maintenance/Test circuit pack can also be on steady when the other ports on the circuit pack are in use, the ports on the Maintenance/Test circuit pack used for ISDN-PRI trunk testing must be busied out before the Maintenance/Test circuit pack is used to help resolve Packet Bus faults. This is done via the **busyout port PCSS02** and **busyout port PCSS03** commands. Also, be sure to release these ports when the process is completed.

- **Off** — there is no Packet Bus fault present.

⇒ NOTE:

It takes 5 to 10 seconds for the LED to respond to a change in the state of the Packet Bus.

In normal switch operation, the Maintenance/Test provides the visual feedback of the Packet Bus state. When standalone mode (described in the next section) is in effect, these visual indications are still provided; however, the Packet Bus is never reconfigured, and, as a result, the yellow LED either blinks or is off.

Standalone Mode

The TN771D Maintenance/Test provides a standalone mode for detecting Packet Bus faults. In the standalone mode, a terminal is connected to the Maintenance/Test circuit pack via the Amphenol™ connector on the back of the cabinet. This setup allows the System Technician to determine the state of the Packet Bus without having to access the Manager I terminal to provide these functions, even if the switch is not in service. Note that the Maintenance/Test does not reconfigure the Packet Bus when it is operating in standalone mode.

Standalone mode is used in the Packet Bus Fault Correction procedures. As a result, **a TN771 and a corresponding terminal must be available to the technician who is to perform such procedures.** A High or Critical Reliability system has a TN771 in each port network. However, the customer of a system that does not have High or Critical Reliability may have purchased a TN771 for ISDN-PRI trunk testing, or to increase the system's ability to detect Packet Bus failures.

The **list configuration** command is used to check for the presence of a circuit pack in the system. If a circuit pack is not present in the system, one must be taken to the customer site. The [“Special Precaution Concerning the TN771”](#) section in this chapter discusses the special cases when a spare TN771 must be taken to the customer site.

NOTE:

When in standalone mode, the yellow LED on the TN771 blinks if there is a Packet Bus fault. If there is no such fault, the yellow LED is off. This is true because Packet Bus reconfiguration cannot occur in standalone mode.

Required Hardware for Standalone Mode

In addition to the TN771, the following equipment is required to use the standalone mode:

1. Terminal or PC with terminal-emulation software. The EIA-232 (RS-232) port should be configured at 1200 baud, no parity, 8 data bits, and one stop bit. This is **not** the same configuration as for the Manager I terminal. Therefore, if the Manager I can be used for this operation (and this depends on the switch configuration and on customer requirements), remember to restore the original communication parameters before returning the Manager I to service.
2. 355A EIA-232 Adapter (COMCODE 105 012 637).
3. 258B Six-Port Male Amphenol Adapter (COMCODE 103 923 025).

4. D8W 8-wire modular cable of an appropriate length to connect the 258A on the back of the cabinet to the 355A adapter. The relevant COMCODE is determined by the length of the cable, as follows:
 - 103 786 786 (7 feet)
 - 103 786 802 (14 feet)
 - 103 786 828 (25 feet)
 - 103 866 109 (50 feet)

Slot Selection for Standalone Mode

When selecting a carrier slot to use for standalone mode in a port network that does not already contain a TN771, keep the following points in mind:

- A port circuit slot (indicated by a purple label) should be used.
- -5 volt power supply must be available in the carrier. This section describes the power supply configurations that provide this power supply.
- It is preferable that the slot chosen is in the A carrier if a free slot that matches the criteria presented in the first two items of information in this list is available.

Entering and Exiting Standalone Mode

NOTE:

When in standalone mode, the red LED on the TN771 is lit. This function is correct, and it serves as a reminder to remove the TN771 from standalone mode.

CAUTION:

The TN771 in standalone must be the ONLY TN771 in the port network. If a TN771 is already in the port network, place that TN771 in standalone mode. Do not insert a second TN771 into standalone mode. System behavior is rendered as undefined if this is done. In addition, the system is not able to detect the extra circuit pack in this case because a TN771 in standalone mode is invisible to the SPE.

CAUTION:

If the TN771 Packet Bus port has reconfigured the Packet Bus in a switch with a High or Critical Reliability system, (indicated by error type 2049 against PKT-BUS), placing the Maintenance/Test in standalone mode causes a loss of service to the Packet Bus. This is true because reconfiguration is not performed in standalone mode. Therefore, this procedure should be considered a service-disrupting procedure.

If the system has a TN771 installed in the Port Network to be examined, use the following steps to enter the standalone mode:

1. Ensure that Alarm Origination is suppressed either at login time or via the Maintenance-Related System Parameters form.
2. Attach the 258B Six-Port Male Amphenol Adapter to the Amphenol connector for the TN771's slot. Connect one end of a D8W 8-wire modular cable to port 1 of the 258B. Connect the other end of the cable to a 355A EIA-232 Adapter. Plug the EIA-232 Adapter into the terminal to be used, and turn the terminal on.
3. Reseat the TN771 circuit pack.

 **NOTE:**

In a High or Critical Reliability system, this causes a Minor, Off-board alarm to be raised against the Packet Bus. This alarm is not resolved until the TN771 (in particular, the Packet Bus port is returned to service. To ensure that Packet Bus alarms have been cleared, it may be necessary to restore the TN771 to normal mode.

If there is no TN771 in the Port Network, use the following steps to enter the standalone mode:

1. Attach the 258A Six-Port Male Amphenol Adapter to the Amphenol connector for the slot into which the TN771 is to be inserted. Connect one end of a D8W 8-wire modular cable to port 1 of the 258A. Connect the other end of the cable to a 355A EIA-232 Adapter. Plug the EIA-232 Adapter into the terminal to be used, and turn the terminal on.
2. Insert the TN771 circuit pack into the slot. The system does not recognize the presence of the circuit pack.

If the standalone mode is entered successfully, the following is displayed on the connected terminal:

Figure 9-1. Normal Standalone Mode Display

CAUTION:

If the display in [Figure 9-1](#) does not appear, be sure to check the wiring between the terminal and the TN771, and also the terminal parameters. If these are correct, the TN771 may be defective. In such a case, follow the procedures to exit standalone mode (described in the next paragraph). Then test the Maintenance/Test circuit pack.

NOTE:

If the TN771 fails while in standalone mode, the message `TN771 circuit pack failed` is displayed, and no further input is accepted on the terminal. The circuit pack must be replaced.

Use the following procedures to exit standalone mode:

1. Remove the 258A Adapter from the Amphenol connector.
2. If the TN771 was installed for this procedure, remove it. Otherwise, reseal the TN771.
3. Be sure that alarm origination is re-enabled on the Maintenance-Related System Parameters form if it was disabled there (if it was disabled at login, it is automatically re-enabled at logoff).

Using Standalone Mode in Packet Bus Fault Isolation and Correction

When the TN771 is in standalone mode, three commands can be used at the terminal:

- **ds** displays the current state of the Packet Bus leads.
- **dsa** toggles auto-report mode on and off. In auto-report mode, the state of the Packet Bus leads are displayed and the terminal beeps whenever a change occurs.
- **?** displays the available commands.

[Figure 9-2](#) presents an example of a standalone mode display. In the display, an 'S' indicates a shorted lead, an 'O' indicates an open lead, and a blank indicates no fault.

```

L L L L L L L L L L H H H H H H H H H S S S L
P 0 1 2 3 4 5 6 7 8 P 0 1 2 3 4 5 6 7 8 S S F B F
S S                                     O
Command:
    
```

Figure 9-2. Example Standalone Mode Display

The information within a standalone mode display is used in the Packet Bus Fault Correction procedures that follow. The TN771 display indicates the specific leads on the backplane to examine for bent or damaged pins. [Figure 9-3](#) shows the location of the packet bus leads on the backplane as viewed from the front of the carrier, while [Figure 9-4](#) shows the same slot as viewed from the back of the carrier.

⇒ NOTE:

This information is available only from the standalone mode and with an on-site connected terminal. This information is not available from the Manager I, and, thus, it is not available remotely. This is not a concern, inasmuch as this information cannot be used effectively if testing is not on site.

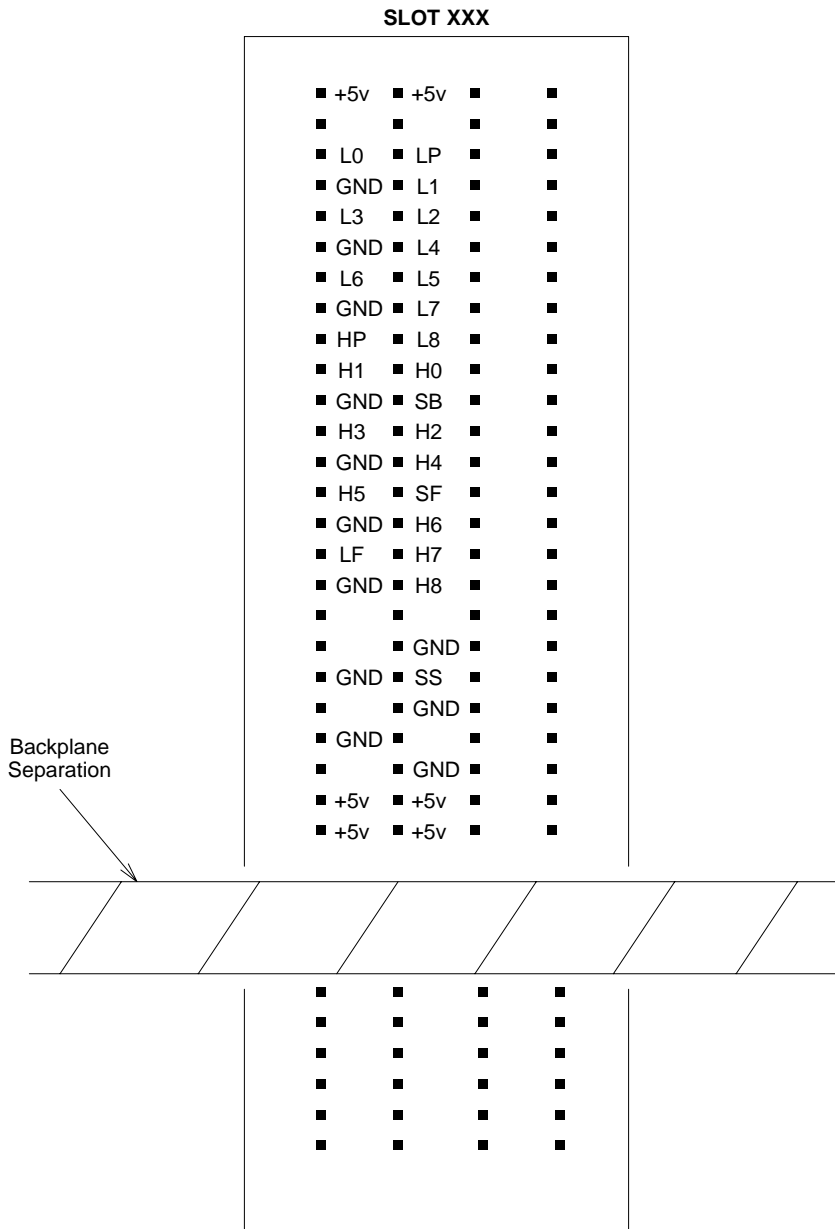

Figure 9-3. Packet Bus Leads on the Backplane - Front View

Figure 9-4. Packet Bus Leads on the Backplane - Back View

Special Precaution Concerning the TN771

⇒ NOTE:

A new TN771 Maintenance/Test circuit pack must be taken to the customer site whenever the following is true:

- Maintenance/Test Packet Bus port indicates that a Packet Bus fault is present.

⇒ NOTE:

Such a fault is indicated by a Major or Minor alarm against the Packet Bus. A Major alarm is indicated in the error log by Error Type 513, while a Minor alarm is indicated by Error Type 2049.

- Test #572 of the PKT-BUS test sequence is the only test that fails.

This precaution is taken because certain failures of the Maintenance/Test circuit pack can appear as Packet Bus failures. To ensure that the problem is indeed with the Packet Bus, implement the following steps:

1. Refer to the M/T-PKT Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#). Correct any problems with the TN771 Maintenance/Test Packet Bus port as described in that section. If the TN771 Maintenance/Test circuit pack is replaced during the correction process, enter the **test pkt P long** command to determine if the Packet Bus faults have been resolved. If there are still Packet Bus problems, correct them by using the procedures in the sections that follow.
2. If the Maintenance/Test circuit pack was not replaced, enter the **test pkt P** command. Record the results (PASS/FAIL/ABORT) and error codes for Test #572.
3. Enter the **status system P** command. Record the information listed for the Packet Bus.
4. Busyout the Maintenance/Test circuit pack by entering the **busyout board PCSS** command.
5. Replace the Maintenance/Test circuit pack with the new circuit pack.
6. Release the Maintenance/Test circuit pack by entering the **release board PCSS** command.
7. Enter the **test pkt P** and **status system P** commands as described in Steps 2 and 3.

8. If the data matches the previously recorded data, a Packet Bus problem exists. The original TN771 Maintenance/Test circuit pack is not defective, and it does not need to be returned to the factory. Replace the original TN771, then correct the Packet Bus problem by using the procedures in the sections that follow.
9. If the data does *not* match the previously recorded data, *the original TN771 Maintenance/Test circuit pack is defective*. If there are still indications of Packet Bus problems, correct them by using the procedures in the sections that follow.

Packet Bus Fault Isolation Flowchart

The flowchart in this section presents the steps to be taken for isolating and resolving Packet Bus problems. The order in which the maintenance objects should be examined can be determined by assessing how wide-spread the failure is. For example, since all ISDN-BRI devices communicate with the TN778 Packet Control circuit pack, this MO should be examined early in the sequence. On the other hand, a failure of a TN570 circuit pack in an EPN may cause ISDN-BRI failure in an EPN, but it could not be the cause of a failure in the PPN.

Whenever the flowchart refers to the Maintenance documentation for a specific MO, keep in mind that the repair procedure for that MO may in turn refer to another MO's repair procedure. The flowchart tries to coordinate these procedures so that a logical flow is maintained if the Packet Bus problems are not resolved via the first set of repair procedures. However, a Packet Bus failure can lead to a somewhat haphazard referencing of various MO procedures that may result in your implementing steps that either have already been completed or are not necessary. If this occurs, return to the flowchart at the step that follows the reference to [Chapter 10, "Maintenance Object Repair Procedures"](#), and then continue.

NOTE:

The following **status** commands can also help diagnose Packet Bus problems:

- **status system**
- **status packet-control**
- **status bri-port**
- **status station**
- **status data-module**

For a description of these commands, refer to the "Status Commands" section in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#). The commands provide information about the service state of various Packet maintenance objects. This information can be useful for remote maintenance, inasmuch it can explain the impact of the failure(s) on the system.

The Packet Bus Fault Isolation Flowchart appears on the following two pages.

NOTE:

See the [“Flowchart Description and Supplement”](#) section following the flowchart for a description of the flowchart as well as for supplementary information, the availability of which is indicated by the uppercase letters that appear in the flowchart.

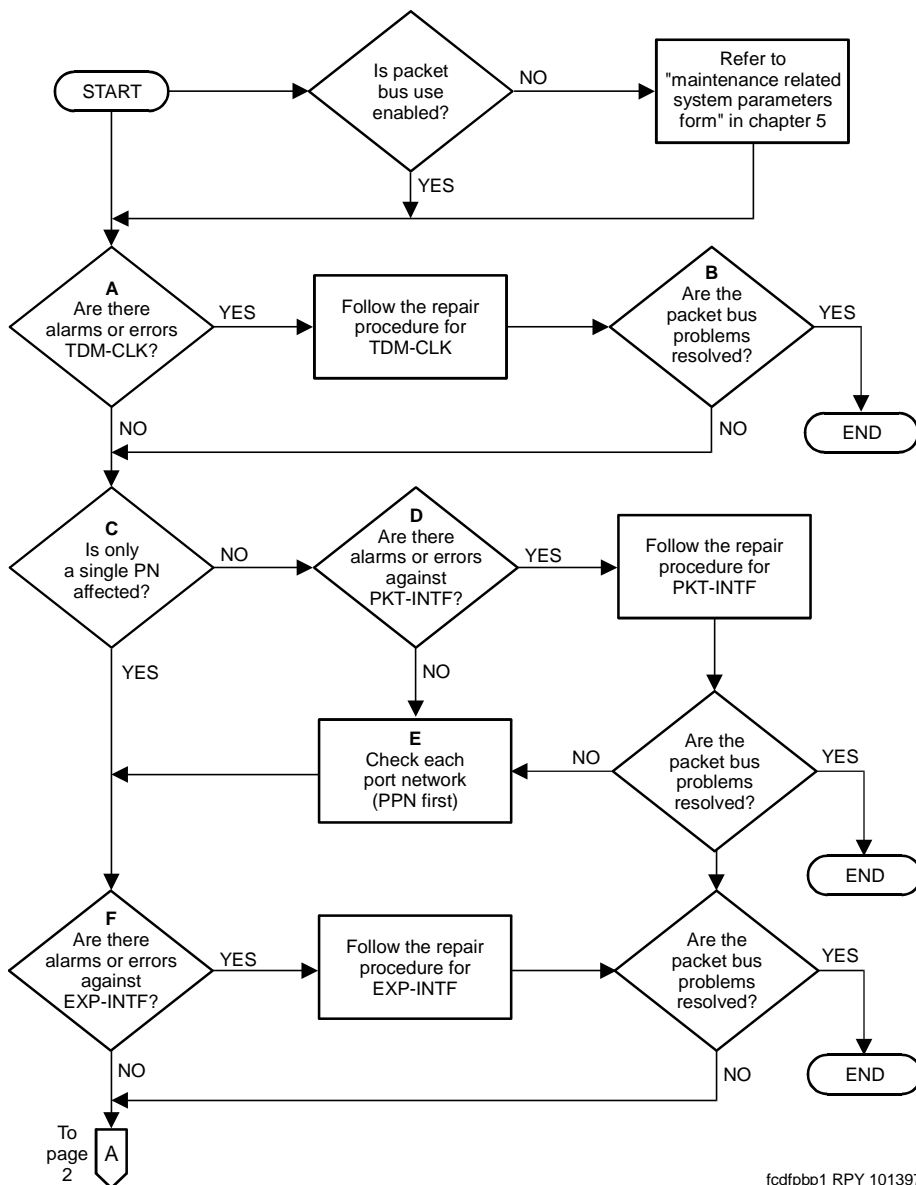

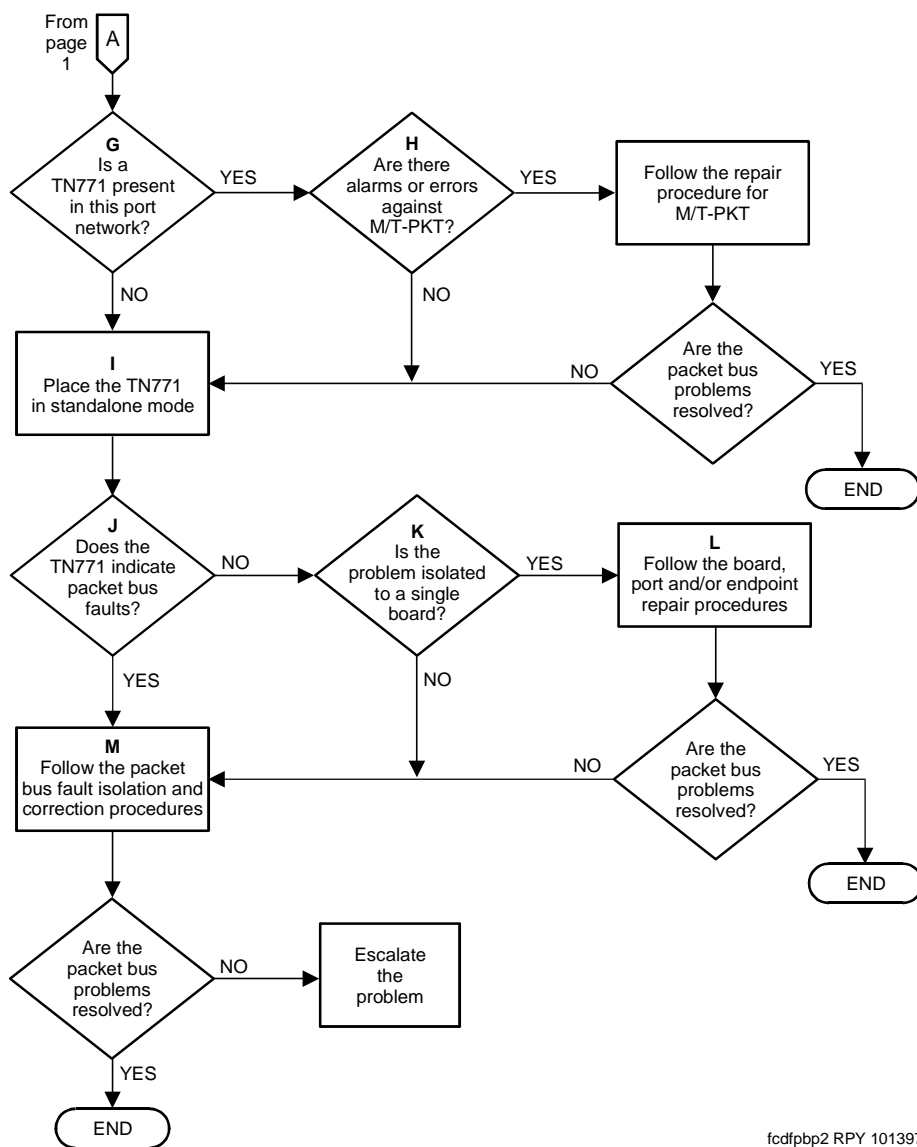

Figure 9-5. Packet Bus Flowchart (Page 1 of 2)

fcdfpbp2 RPY 101397

Figure 9-6. Packet Bus Flowchart (Page 2 of 2)

Flowchart Description and Supplement

An uppercase letter in bold (for example, **A**, **B**, **C**, etc.) indicates that there is supplemental information with details about the relevant process that could not fit into the appropriate box or diamond.

⇒ NOTE:

Due to space restrictions, individual error codes and alarms are not detailed on the flowchart. The maintenance object descriptions in [Chapter 10, "Maintenance Object Repair Procedures"](#), discuss which errors and alarms could cause or be indicative of Packet Bus problems. In general, unless an error, alarm, or test refers explicitly to the TDM Bus, the error, alarm, or test should be considered a possible cause of Packet Bus problems.

The following paragraphs supplement the corresponding letter in the flowchart.

- a. Problems with the system clock (TDM-CLK) can cause service disruptions on the Packet Bus as well as on the TDM Bus. Therefore, if there are alarms active against TDM-CLK, these alarms should be resolved before any other Packet Bus fault isolation is attempted.

⇒ NOTE:

All TDM-CLK problems should be resolved before the process is continued, even if the problems refer only to the TDM Bus. (This is an exception to the previous note.) This is recommended because a Packet Bus problem cannot cause a TDM-CLK problem, while a TDM-CLK problem can cause a Packet Bus problem.

- b. The question "Are the Packet Bus problems resolved?" appears several times on the flowchart. This is a general question that can involve several checks. The basic question is "Are the problems that caused you to use this flowchart resolved?" Some of the more specific questions might be:
 - Are all Packet Bus alarms resolved?
 - Are all Packet circuit pack (port, endpoint) alarms resolved?

⇒ NOTE:

If all alarms are resolved, issue the **clear pkt** command. This command attempts to put the switch back into the service state by resolving any BRI problems that exist. Refer to [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#), for more information.

- Are all ISDN-BRI stations/data modules and/or ASAI adjuncts in service?
 - Does the Maintenance/Test Packet Bus port (in normal or standalone mode) still indicate a Packet Bus fault?
- c. If only a single EPN is affected, the Packet Control is probably not the source of the problem. However, if all of the ISDN-BRI circuit packs are located in a single EPN, assume that the answer to this question is "No," and check the Packet Control.

- d. A Packet problem that affects more than one port network is probably caused by either a Packet Control failure or a PPN Packet Bus failure. The Packet Control is checked before the Packet Bus Fault Correction procedures are implemented.
- e. Because the Packet Bus in each port network is physically separate, each affected port network must be checked individually. The PPN should be checked first, however, since any EPN Packet problems are usually resolved once the PPN Packet problem is resolved. After resolving the problem in one port network, be sure to check if the problems in other port networks have also been resolved.
- f. This step applies only when an attempt to resolve an EPN Packet Bus problem is made. When checking the Expansion Interfaces in an EPN, be sure to check the corresponding ones in the PPN. Also, recall that all Expansion Interfaces in 286 systems, 386 systems, or later systems that are using the Packet Bus must be TN570s. Using TN776s results in an EPN where TDM traffic works but Packet traffic does not work.
- g. If a TN771 is not present, one must be installed to accommodate the standalone mode, which is discussed earlier in this chapter.
- h. If a TN771 is present, it can fail in such a fashion that it eventually disrupts the Packet Bus or misinterprets a Packet Bus problem.
- i. If work is being done on-site, follow the procedures described earlier in this chapter for placing the TN771 into standalone mode. If work is not being done on-site, go to the next step.
- j. The answer is "Yes" if the TN771 in standalone mode indicates any faulty leads. The answer is also "Yes" if Test #572 in the PKT-BUS test sequence fails, and/or if the **status system** display indicates that faulty leads are present and the TN771 in the port network is known to be functioning correctly.
- k. If the non-functional endpoints are isolated to a single circuit pack, the circuit pack is probably the cause of the problem.
- l. The procedures that must be executed are determined by which maintenance objects on the circuit packs are alarmed. Start with the procedures for the circuit pack errors/alarms, then continue with those for the port. Finally, execute the procedures for the endpoint.
- m. Follow the procedures outlined later in this chapter.

Packet Bus Fault Correction

Using and interpreting results from the status system command

The **status system** command can be issued to retrieve information about the Packet Bus. This command is described fully in the "Status Commands" section in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

The **status system** command provides the service state, alarm status, and (if the Maintenance/Test Packet Bus port is activated) the number of faulty and open leads. This information can be used to determine the urgency of the repair. In general, a service state of "out" indicates extreme urgency, while a service state of "reconfig" indicates moderate urgency.

CAUTION:

Ultimately, the urgency of a repair is determined by the customer's requirements. A customer who uses ISDN-BRI for station sets probably considers a Packet Bus failure critical. However, a customer with only a small percentage of ISDN-BRI service may consider even an uncorrectable Packet Bus fault to be of minor importance and may prefer to delay performing repairs, due to their destructive nature.

NOTE:

If maintenance is actively running on the Packet Bus at the time the **status system** command is issued, the data reported for the Packet Bus may be inconsistent. The reason is that this data is updated by the maintenance tests that are running. If the data seems inconsistent, enter the command again.

If test results or the results of the **status system** command indicate that there are 24 faults on the Packet Bus, the problem is probably caused by faulty cables between carriers, or by defective bus terminators. However, before proceeding, make sure that the report is not being falsely given by the Maintenance/Test Packet Bus port. Accordingly, look for an M/T-PKT error in the error log. Then test the Maintenance/Test Packet Bus port by entering the **test port** command. Refer to the ["Special Precaution Concerning the TN771"](#) section earlier in this chapter if any problems are suspected.

If the carrier into which a TN771 Maintenance/Test circuit pack is installed does not have a -5 volt power supply, the Maintenance/Test Packet Bus port reports 24 open leads on the Packet Bus (via the **status system** command and via Test #572 of the PKT-BUS test sequence). No failure of the TN771 is indicated in this case because the TN771 is not defective. Refer to CARR-POW maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#), and ensure that a -5 volt power supply is available.

Considerations for High and Critical Reliability Systems

If a High or Critical Reliability system is involved, special considerations involving the features of this type of system must be kept in mind. In particular, if a Packet Bus problem is caused by a duplicated component, switching to the standby component may both alleviate the problem and isolate the faulty circuit pack. Therefore, the commands in the following list should be executed first in a High or Critical reliability system. For more information on these commands, refer to [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

- **reset system interchange** If this command resolves the Packet Bus problem, the problem is with the Packet Control in the (new) standby SPE. Refer to PKT-CTRL maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#).
- **set exp-link** If this command resolves the Packet Bus problem, the problem is with either the (new) standby EI Link or the EIs at either end. Refer to EXP-INTF maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#).
- **set tone-clock** If this command resolves the Packet Bus problem, the problem is with the (new) standby Tone-Clock. Refer to TDM-CLK maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#).

⇒ NOTE:

Keep in mind that, even though the steps discussed in the previous list may fail to resolve the problem, the steps are not necessarily fault-proof. Continue with the procedures in the next section.

Troubleshooting Procedures

As we discussed earlier in this chapter, Packet Bus faults are usually caused by a defective circuit pack connected to the backplane, by bent pins on the backplane, or by defective cables/terminators that make up the Packet Bus. The first two faults cause shorts, while the third fault causes either shorts or opens.

There are four procedures for correcting Packet Bus faults. The number of procedures that are to be used to correct faults depends upon a number of factors relevant to system performance and to the content of the procedures themselves. For example, if the Maintenance/Test Packet Bus port is activated, and if there is an indication of open leads on the Packet Bus (either via the **status system** command or via Test #572 failure), **go directly to Procedure 4**. The reason for this is that Procedures 1 through 3 try to locate faulty circuit packs or bent pins behind circuit packs. Since these types of failures can never cause open faults, Procedures 1 through 3 need not be implemented in this case. However, if there are both shorts and opens, execute Procedure 4, then return to Procedure 1 if there are still shorts after the open lead problems are resolved.

CAUTION:

Since Packet Bus fault isolation procedures involve removing circuit packs and possibly disconnecting entire carriers, these procedure have a profound effect on service. Therefore, if possible, implement these procedures after hours or during hours of minimum system use.

NOTE:

Each of these procedures contains one or more steps that require a determination as to whether the Packet Bus problem has been resolved. Accordingly, several condition checks must be performed. We can present each such check in the form of a question, as follows:

- Did the Maintenance/Test circuit pack standalone mode initially indicate the existence of faulty leads, and are these leads no longer indicated?
- Have all alarms against the Packet Bus and Packet circuit packs been resolved?

NOTE:

If all alarms are resolved, issue the **clear pkt** command. This command attempts to put the switch back into the service state by resolving any BRI problems that exist. Refer to [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#), for more information.

- Are all ISDN-BRI stations and data modules as well as any relevant ASAI adjuncts in service?

Note that if one of these conditions is not yet met, the others need not be checked.

The following sections discuss the four procedures for correcting Packet Bus faults.

Procedure 1

Procedure 1 determines if any circuit packs that use the Packet Bus have faults. For each circuit pack type (see [Table 9-1](#)), perform the following steps:

NOTE:

The circuit packs need not be checked in the order presented *if the flowchart in this chapter has been followed*. However, if newly added circuit packs are involved, check these packs first, inasmuch as the packs are most likely to have caused a problem.

1. Display the Error and Alarm Logs for the circuit pack via the **display errors** and **display alarms** commands.

2. If there are errors for the circuit pack, refer to the appropriate maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#), and follow the recommended maintenance procedure to resolve the errors. Note that some of these procedures may refer to PKT-BUS maintenance as the cause of the fault; if so, implement these Packet Bus Fault Correction procedures at that point.
3. After implementing the repair procedure for the circuit pack (and regardless of whether this procedure succeeds or fails), determine if the Packet Bus fault is still present.
4. If the Packet Bus fault is still present, implement Procedure 1 for the next circuit pack.
5. If there are no more circuit packs in the list, go to Procedure 2.
6. If the Packet Bus fault has been resolved, the procedures are completed.

Table 9-1. Packet Circuit Packs

Circuit Pack Name	Circuit Pack Code	Associated Maintenance Objects
ISDN-BRI	TN556	BRI-BD, BRI-PORT, ABRI-PORT, BRI-SET, BRI-DAT, ASAI-ADJ
Maintenance/Test	TN771	M/T-BD, M/T-PKT
Packet Control	TN778	PKT-CTRL
Expansion Interface	TN570	EXP-INTF

Procedure 2

Procedure 2 removes and reinserts port circuit packs (those in the purple slots) one or several at a time. Use Procedure 2 for each port circuit pack in the port network until either (1) the problem is resolved or (2) there are no more circuit packs in the port network.

NOTE:

This procedure should also be used for the TN570 Expansion Interface circuit pack in a standard system. For a High or Critical Reliability system, refer to Procedure 3 for the Expansion Interface circuit pack. Also, refer to Procedure 3 for the TN768 or TN780 Tone-Clock circuit pack in a switch with a High or Critical Reliability system.

CAUTION:

The Expansion Interface circuit pack should be the last one checked in this procedure, since removing this circuit pack disconnects its EPN. The Tone-Clock circuit pack should be the next-to-last one checked. In addition, the TN771 must be reseated after the Tone-Clock is reinstalled.

If the Packet Bus problem is present when the circuit pack is inserted, but is resolved when the circuit pack is removed, either the circuit pack or the backplane pins in that slot caused the problem. If the backplane pins are intact, replace the circuit pack.

⇒ NOTE:

In a multiple failure situation, the circuit pack could be one cause of the Packet Bus problem. However, there could also be other failures that are causing Packet Bus faults.

In Procedure 2, an option of working either with one circuit pack at a time or with multiple circuit packs simultaneously is available. In view of this, determine the level of service interruption to be allowed during this procedure. If causing a disruption to all users in the port network is deemed permissible, large groups of circuit packs should be worked with. This option allows faster job completion. *However, if large service disruptions are to be avoided, work with one circuit pack at a time.* This option is slower, but it disrupts only the users of a single circuit pack.

▲ CAUTION:

If the TN771 Standalone mode does NOT indicate Packet Bus faults, perform Procedure 2 for ONLY the port (purple) slot Packet circuit packs listed in [Table 9-1](#). Also, problems with the backplane pins need not be checked for. Determining if the problem is resolved by removing circuit packs is sufficient.

Steps for Procedure 2:

1. Remove one or several circuit packs as appropriate, according to the considerations presented in the previous paragraphs. Any circuit pack(s) (whether Packet or non-Packet) that have been recently inserted should be checked first. It is likely that such a circuit pack caused a new problem. Keep in mind that Packet circuit packs should be checked before non-Packet circuit packs.

If the decision is made to remove multiple circuit packs, consider working with an entire carrier at a time to ensure a good granularity.

2. Determine if the Packet Bus fault is still present.
3. If the Packet Bus fault is still present:
 - Determine if the backplane pins in the removed circuit pack's slot are bent. Use the output from the Maintenance/Test standalone mode and [Figure 9-3](#) and [Figure 9-4](#).
 - If the backplane pins are bent, power down the carrier (refer to the "Removing Power" section in [Chapter 5, "Routine Maintenance Procedures"](#), straighten or replace the pins, reinsert the circuit pack, restore power (refer to the ["Restoring Power"](#) section in [Chapter 5](#), and repeat Procedure 2, beginning with Step 2, for the same circuit pack.

WARNING:

If this is a High or Critical Reliability system, and if the slot is in the Active control carrier, perform an SPE interchange before changing the circuit pack. Follow the procedures presented in [Chapter 6, "Reliability Systems: A Maintenance Aid"](#).

- If the backplane pins are not bent, reinsert the circuit pack(s), and perform Procedure 2 for the next set of circuit packs.
4. If the Packet Bus fault is not present, do the following:
- Reinsert a circuit pack. If multiple circuit packs have been removed, reinsert the circuit packs **one at a time**, and repeat the following substeps until all of the circuit packs have been reinserted.
 - Determine if the Packet Bus fault has returned.
 - If the Packet Bus fault has returned, the reinserted circuit pack is defective. Replace the circuit pack and then continue.
 - If the Packet Bus fault does not return when all of the circuit packs have been reinserted, the procedure is completed.

Continue with Procedure 3 if all the port circuit packs have been checked, but the Packet Bus fault is still not resolved.

Procedure 3

Procedure 3 removes and reinserts control carrier circuit packs one at a time. The Packet Control, Tone-Clock, and Expansion Interface circuit packs are the only processor complex circuit packs that communicate on the Packet Bus. In addition, the Memory 1 and EPN Maintenance Board circuit packs are connected to the Packet Bus in the backplane (while the Memory 2 circuit pack is not). Therefore, these are the only processor complex circuit packs that are likely to cause a Packet Bus problem in a stable system. As a result, Procedure 3 should be performed only on the Packet Control, Memory 1, and EPN Maintenance Board circuit packs in all systems, and on the Expansion Interface and Tone-Clock circuit packs in High and Critical Reliability systems.

CAUTION:

If the TN771 Standalone mode does NOT indicate Packet Bus faults, perform Procedure 3 for ONLY the Packet Control, Expansion Interface, and Tone-Clock circuit packs. Also, problems with the backplane pins need not be checked for. Determining if the problem is resolved by removing circuit packs is sufficient.

In a system without High or Critical Reliability, do the following:

1. Power down the control carrier. Refer to the ["Removing Power"](#) section in [Chapter 5, "Routine Maintenance Procedures"](#).

2. Remove the suspect circuit pack.
3. As in Procedure 2, determine if the backplane pins in the removed circuit pack's slot are bent.
4. If the backplane pins are bent, do the following:
 - a. Straighten or replace the pins
 - b. Insert the same circuit pack
5. If the backplane pins are not bent, replace the circuit pack (reinsert the circuit pack if a replacement is not available).
6. Turn the power back on to reboot the system. Refer to the [“Restoring Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
7. Determine if the Packet Bus fault is still present.
8. If the Packet Bus fault is still present, do the following:
 - a. If the circuit pack was reinserted in Step 5, replace the circuit pack, and repeat Procedure 3.
 - b. If the circuit pack was replaced in Step 5, repeat Procedure 3 for the next processor complex circuit pack.
9. If the Packet Bus fault does not recur, the procedure is completed.

If Procedure 3 fails to identify the cause of the problem, go to Procedure 4.

In a High or Critical Reliability System, do the following:

1. If the circuit pack to be replaced is in the SPE, perform an SPE interchange by entering the **reset system interchange** command. For an Expansion Interface circuit pack, enter the **set exp-link** command to switch to the standby expansion link. For a Tone-Clock circuit pack, enter the **set tone-clock** command to switch to the standby Tone-Clock circuit pack.
2. Remove the newly-inactive suspect circuit pack. For a circuit pack in the processor complex, use the procedures in [Chapter 6, “Reliability Systems: A Maintenance Aid”](#).
3. As in Procedure 2, determine if the backplane pins in the removed circuit pack's slot are bent.
4. If the pins are bent, do the following:
 - a. Power down the carrier. Refer to the [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
 - b. Straighten or replace the pins.
 - c. Insert the same circuit pack.
 - d. Restore power to the carrier. Refer to the [“Restoring Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
5. If the backplane pins are not bent, insert or replace the circuit pack.

6. Determine if the Packet Bus fault is still present.
7. If the Packet Bus fault is still present, do the following:
 - a. If the circuit pack was reinserted in Step 5, replace the circuit pack. Then repeat Procedure 3, starting at Step 2.
 - b. If the circuit pack was replaced in Step 5, continue with Step 9.
8. If the Packet Bus fault does not recur, then the procedure is completed.
9. If the suspect circuit pack has been tested in the other control carrier, go to Step 10. Otherwise, implement Step 1, then Steps 2 through 8.
10. Repeat the procedure in the previous step for the next suspect circuit pack.

If all processor complex circuit packs have been checked and the problem is not resolved, continue with Procedure 4.

Procedure 4

Procedure 4 tries to isolate the failure to a particular set of carriers. Only the circuit packs in those carriers are checked. Procedure 4 is used if the preceding procedures fail, because it can help locate multiple circuit pack failures as well as failures of the carrier hardware. The procedure is also used if there are open leads on the Packet Bus. (The faults detected by Procedures 1 through 3 cannot cause open leads.)

In Procedure 4, the TDM/LAN Cable Assemblies and TDM/LAN termination resistor packs are replaced. If this action does not resolve the Packet Bus fault, the carriers are reconfigured by moving the termination resistor packs in such a manner that certain carriers are disconnected from the bus. This is done by moving the termination resistors on the carrier backplanes. To terminate the Packet Bus at the end of a particular carrier, first unplug the cable that connects the carrier to the next carrier and then replace the cable with a termination resistor (see [Figure 9-6](#)). When the length of the Packet Bus is modified via this procedure, circuit packs that are essential to system operation (for example, Processor Complex, Tone-Clock) must still be connected to the new "shortened" Packet (and TDM) Bus. In addition, the Maintenance/Test circuit pack (in standalone mode) must be connected to the "shortened" bus.

WARNING:

Power must be removed from the entire port network before any cables or terminators are removed. Failure to do so can cause damage to circuit packs and power supplies and can be hazardous to the technician. After cabling changes are made and verified, power must be restored to the port network. Use the TN771 Standalone mode to determine if the Packet Bus fault is resolved.

**CAUTION:**

Circuit packs in carriers that are not part of the shortened bus are not inserted. As a result, these circuit packs are not alarmed. Ignore these alarms for now. All alarms should be resolved when the cabinet is restored to its original configuration.

Figure 9-7. Carrier Rewiring Example

Procedure 4 is organized into two parts, as follows:

Part 1:

1. Power down the PN. See [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
2. Replace all of the TDM/LAN cables and both TDM/LAN terminators.
3. Restore power to the PN. See [“Restoring Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
4. Determine if the packet bus fault is still present.
5. If the fault is present, go to Part 2.

Part 2:

Processor Port Network:

1. Terminate the Packet Bus so that it extends only from the Active control carrier (that is, the carrier that contains the Active SPE) to the carrier that contains the Maintenance/Test circuit pack. To allow this procedure to isolate the failure to the smallest possible number of carriers, place the Maintenance/Test circuit pack into a carrier that contains a processor complex, if possible.
2. Determine if the Packet Bus fault is still present. If so, and if there are shorts on the Packet Bus, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers that are connected to the "shortened" Packet Bus. (Procedure 2 is performed for port circuit packs, and Procedure 3 is performed for processor complex circuit packs.)
3. If the Packet Bus fault is not present, extend the Packet Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, and if there are shorts, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.
4. If the Packet Bus fault recurs as the Packet Bus is extended, and if Procedures 2 and 3 (if performed) do not resolve the problem, the added carrier(s) that caused the problem to recur are defective and must be replaced.

Other Port Networks:

1. Terminate the Packet Bus so that it extends only from the carrier that contains the Active Expansion Interface to the nearest carrier that contains the Maintenance/Test circuit pack. Place the Maintenance/Test circuit pack into a carrier that contains an Expansion Interface circuit pack in order to allow the procedure to isolate the failure to the smallest possible number of carriers.
2. Determine if the Packet Bus fault is still present. If so, and if there are shorts on the Packet Bus, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers that are connected to the "shortened" Packet Bus.
3. If the Packet Bus fault is not present, extend the Packet Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, and if there are shorts, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.
4. If the packet bus fault recurs as the packet bus is extended, and if Procedures 2 and 3 (if performed) do not resolve the problem, the added carrier(s) that caused the problem to recur are defective and must be replaced.

9 Packet Bus Fault Isolation and Correction
Packet Bus Fault Correction

9-34

Maintenance Object Repair Procedures

10

For Maintenance Objects on the DEFINITY Wireless Business System (DWBS), refer to the appropriate documentation that accompanies the DWBS.

Trouble-clearing is based on the type of indication received, system-alarmed troubles, or user-reported troubles. When viewing the Alarm Log, all major alarms display first, followed by minor alarms, and warning alarms. Resolve the first alarmed entry first because it may affect the rest of the alarmed entries. System-alarmed and user-reported troubles may exist at the same time. Always clear the alarmed troubles first. This often clears the user-reported faults without additional maintenance.

Escalation Procedures

This document is not intended to solve all troubles. When the limits of these procedures are reached and the problem is not resolved, it is the technician's responsibility to escalate to a higher level of technical support. Escalation must conform to the procedures in the *Technical and Administration Plan*.

Cabling Precautions

CAUTION:

Do not cut or bend fiber optic cables. Doing so may adversely affect communication between the EPN and the PP N cabinets.

CAUTION:

To avoid damaging the cable-to-connector interface when removing any Inter-Carrier Cable, grasp the cable connector, not the cable itself.

12V-PWR (12-Volt Power Supply)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
12V-PWR	MINOR	test card-mem sh	12-Volt Power Supply
12V-PWR	WARNING	test card-mem sh	12-Volt Power Supply

Programming the TN790B Processor circuit pack flash memory devices and the removable translation card requires the 12-Volt Power Supply unit on the TN777B Netcon and TN794 NetPkt circuit packs. During the erase and write operations of a flash memory or translation card, the 12-Volt power supply must be on. The read-only operation does not require the 12-Volt power supply.

If the 12-volt power supply is not on, all the erase and write operations to a flash device fail. If the software cannot turn on the 12-volt power supply, commands such as **save translation** and **save announcements**, and features such as system upgrade, hard patching, and core dump fail.

Error Log Entries and Test to Clear Values

Table 10-1. 12-Volt Power Supply Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test card-mem
1 ²	Any	12-Volt Power Supply Test (#701)	MINOR	ON	test card-mem

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 The 12-volt power supply is not on (required power supply for the flash memory or the translation card).

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
12-Volt Power Supply Test (#701)	X	X		ND
Memory Card Insertion Test (#695) ²	X	X		ND
Memory Card Format and Read Test (#696) ²	X	X		ND
Memory Card Match Test (#697) ²	X	X		ND
Memory Card Write-Protected Test (#698) ²	X	X		ND
Memory Card Directory Recovery Test (#699) ²	X	X		ND
Memory Card Translation Data Integrity Test (#694) ²		X		ND
Memory Card Erase/Write/Read Test (#693) ²		X		ND

1 D = Destructive; ND = Nondestructive

2 Refer to "CARD-MEM (Memory Card)" information for a description of this test.

12-Volt Power Supply Test (#701)

The purpose of this nondestructive test is to diagnose the 12-Volt power supply unit on the NETCON and NETPKT circuit packs. The test does not start or verify erase and write-to-memory operations, and it does not change the contents of flash memory or of the memory card.

The test verifies that 12-Volt power appears by reading the control register in the NETCON or NETPKT circuit packs.

Table 10-2. 12-Volt Power Supply Test

Error Code	Test Result	Description/Recommendation
2106	ABORT	Internal system error
2114		1. Retry the command at 1-minute intervals, up to 5 times.

Continued on next page

Table 10-2. 12-Volt Power Supply Test — Continued

Error Code	Test Result	Description/Recommendation
109	FAIL	The 12-Volt power supply unit in the NETCON or NETPKT circuit packs is not on. <ol style="list-style-type: none"> 1. Retry the command (test card-mem) to verify operation of 12-Volt power supply. 2. If the problem persists, replace the circuit pack. 3. Retry the command (test card-mem). The alarm is resolved after the test passes twice.
	PASS	The 12-Volt power supply unit is functioning correctly.

ABRI-PORT (ASAI ISDN-BRI Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ABRI-PORT ²	MAJOR(b)	test port PCSSpp l	ASAI ISDN-BRI Port
ABRI-PORT	MINOR	test port PCSSpp l	ASAI ISDN-BRI Port

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., and so forth); and pp is the 2-digit port number (for example, 01).
- 2 The alarm level for ABRI ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to MAJOR for all ABRI ports in the system.

NOTE:

Refer to "BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)" for repair procedures.

AC-POWER

AC Power for AC-Powered Systems

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
AC-POWER	WARNING	test environment P	AC Power

- 1 Where P is an appropriate port network number determined via the PORT field from the Alarm or Error Log.

NOTE:

For environment maintenance, PPN or EPN cabinet configuration aspects in a high or critical reliability system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Also refer to the DC-POWER (DC Power) for environment maintenance strategy.

The AC Power MO represents the AC power provided to the system from a wall outlet. The AC power comes from the wall outlet, through the Power Distribution Unit (PDU), if installed, and is then distributed to the various cabinets. The battery charger monitors AC power via fuse F3 (see [Figure 10-1](#)). If no PDU is installed, the power is supplied directly to each cabinet from each individual wall outlets.

When the system loses power (for example, a power outage in the building), a Major alarm is logged against AC Power and the system goes on battery backup, which is known as Nominal Power Holdover (NPH). If power is restored before the NPH time expires, the alarm is resolved. Each basic control cabinet has separate batteries for NPH. The nominal power holdover provided is as follows:

- The batteries power the system for 10 seconds in a PPN cabinet, for 15 seconds in an EPN cabinet, and for 10 minutes in the control carrier in a Standard Reliability system.
- The batteries also provide system power for 5 minutes in the control carrier in High and Critical Reliability systems.

WARNING:

Before powering down a cabinet or carrier that contains DEFINITY AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging the AUDIX software. Instructions for powering down this unit are in the "DEFINITY AUDIX System Power Procedures" in Chapter 5, "Routine Maintenance Procedures", on the circuit pack, and in DEFINITY AUDIX documentation.

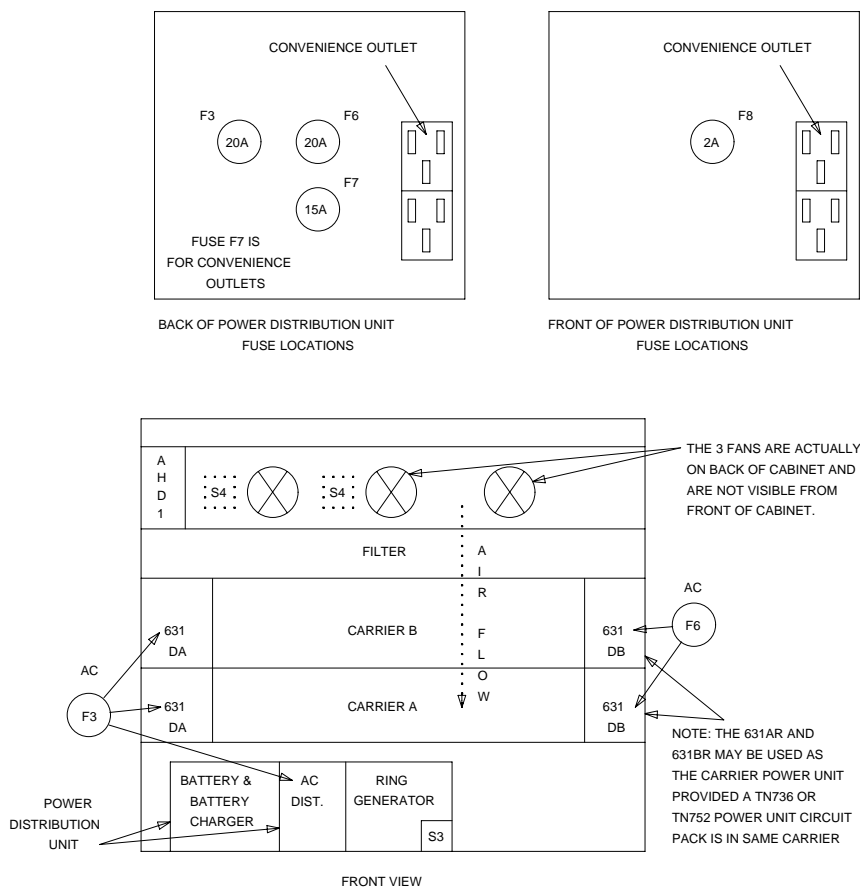

Figure 10-1. Small Cabinet Environment Components (AC-POWER)

Error Log Entries and Test to Clear Values

Table 10-3. AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment P sh r 1
513	Any	AC Power Query Test (#78)	WARNING	OFF	test environment P sh r 1

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence.

Refer to the appropriate test description and follow the recommended procedures.

AC Power Query Test (#78)

Table 10-4. TEST #78 AC Power Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to ABORT with Error Code 2000, check for system powering problems with the A carrier (PPN or EPN). Resolve all DC-POWER alarms. Then, repeat the test. 3. If the test continues to ABORT with a 2000 Error Code, resolve all DUPINT (Duplication Interface) errors in a high or critical reliability system PPN, PR-MAINT (Maintenance/Tape Processor) errors in a standard PPN, or MAINT (EPN Maintenance circuit pack) errors in an EPN. Repeat the test.
2029	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-4. TEST #78 AC Power Query Test — Continued

Error Code	Test Result	Description / Recommendation
1 (cont'd.)	FAIL (cont'd.)	2. Procedures for a Global MCC (J58890CH): <ol style="list-style-type: none"> a. For a nominal holdover system if there is no AC power at the wall outlet, then the problem is not with the system itself. Power must be restored to the wall outlet. b. If there is AC power at the wall outlet, then there could be a problem with the Rectifiers (RM850), Battery Interface Unit, or battery. Resolve all alarms logged against the POWER Maintenance Object, and rerun the test. If the test still fails, the BIU may be defective. Check to see if the BOD alarm LED is “on”, on the BIU. If the BOD LED is “on” replace the Battery Interface Unit (BIU). If the BOD LED is “off” and the BOK LED is “on” then the SYSAM or the EPN Maintenance circuit pack may be incorrectly reporting the problem. Resolve all alarms against these Maintenance Objects and rerun the test.
100	FAIL	The switch is currently without AC power, and AC Power maintenance is in the middle of timing the NPH interval. <ol style="list-style-type: none"> 1. Follow the repair steps outlined above for Error Code 1.
	PASS	The PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system has reported that the switch has AC power. If there is no AC power at the wall outlet, then look for and resolve all alarms against the appropriate MO listed.

AC Power for DC-Powered Systems

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
AC-POWER	WARNING	test environment P	AC Power

¹ Where P is an appropriate port network number determined via the PORT field from the Alarm or Error Log.

NOTE:

For environment maintenance, the PPN or EPN cabinet configuration aspects in a High or Critical Reliability system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Refer to the "DC-POWER (Single-Carrier Cabinet Power)" information for environment maintenance strategy.

In a DC-powered multicarrier cabinet system, the AC-POWER maintenance object still exists, but serves no functional purpose. Because the system cannot determine the type of powering provided, all AC-POWER tests should always either pass or abort.

Error Log Entries and Test to Clear Values

Table 10-5. AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment P sh r 1
513	Any	AC Power Query Test (#78)	WARNING	OFF	test environment P sh r 1

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the *AC Power Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-6. System Technician-Demanded Tests: AC-Power

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78)	X	X	ND
Power Unit Query Test (carrier E) (#127) (b)	X	X	ND
Power Unit Query Test (carrier D) (#127) (b)	X	X	ND
Power Unit Query Test (carrier A) (#127) (b)	X	X	ND
Power Unit Query Test (carrier B) (#127) (b)	X	X	ND

Continued on next page

Table 10-6. System Technician-Demanded Tests: AC-Power — Continued

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Power Unit Query Test (carrier C) (#127) (b)	X	X	ND
Emergency Transfer Query Test (#124) (c)	X	X	ND
Cabinet Temperature Query Test (#122) (d)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

¹ D = Destructive, ND = Non-destructive

Notes:

- a. Refer to "POWER" for a description of this test.
- b. Refer to "CARR-POW" for a description of this test.
- c. Refer to "EMG-XFER" for a description of this test.
- d. Refer to "CABINET" for a description of this test.
- e. Refer to "EXT-DEV ADMIN? N" or "EXT-DEV ADMIN? Y" for a description of this test.
- f. Refer to "RING-GEN" for a description of this test.

AC Power Query Test (#78)

This test queries the Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of AC power to the switch. In a DC-powered system, this test should never fail.

Table 10-7. TEST #78 AC Power Query Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available.
2000	ABORT	Response to the test request was not received within the allowable time period.
2029	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
any	FAIL	The Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system is incorrectly reporting a problem with AC power. If this test fails, the problem is with the circuit pack and not with AC-POWER. The suspect circuit pack, depending on the system configuration, should be replaced and the test rerun.
	PASS	All that can be inferred is that the PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system is working properly.

ADM-CONN (Administered Connection)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ADM-CONN	MAJOR	status administered-connection N	Administered Connection
ADM-CONN	MINOR	status administered-connection N	Administered Connection
ADM-CONN	WARNING	status administered-connection N	Administered Connection

- 1 Where N is an appropriate Administered Connection number determined via the PORT field from the Alarm or Error Log.

An Administered Connection provides an end-to-end connection between two access endpoints or data modules. This connection is automatically established when the administered connection is administered and is due to be active. An error is logged when an administered connection cannot be established or when an established administered connection fails. An alarm is logged when a connection cannot initially be established or fails and cannot be reestablished. An alarming strategy is supported on a per administered connection basis. An alarm is raised for a connection when either the number of consecutive failed attempts to establish the connection reaches the alarm threshold or it can be determined that a failed attempt to establish was due to an administered error. The alarm raised (major, minor, warning, or none) is specified in the *Alarm Type* field of the Administered Connection Administration Form.

Table 10-8. Administered Connection Error Log Entries — Continued

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
127 (a)(b)(c)(g)	Any	None	Any	OFF	None

Notes:

- a. These errors have no specific test associated with them. Refer to Notes b through p for an explanation and appropriate action.
- b. These errors are valid only for administered connection established over ISDN facilities; only error 127 is valid for administered connection established over non-ISDN facilities (or between two endpoints on the same switch).
 - Aux Data 1—Administered connection establishment failed
 - Aux Data 2—Active administered connection failed; attempting reestablishment via auto restoration
 - Aux Data 3—Auto restoration failed
 - Aux Data 4—Active administered connection failed; attempting reestablishment via fast retry
 - Aux Data 5—Fast retry failed
- c. These errors are typically associated with administrative problems and are not expected to be of a temporary nature. Therefore, the administered connection is not retried and the failure is alarmed immediately (the alarm threshold specified by the customer is ignored).
- d. The address of the destination endpoint is: an unassigned number (1); has an invalid number format (28); or is restricted from terminating calls ("Access Denied") [due to COR (Class of Restriction)]. Verify that the destination address is correct and that the destination endpoint is administered. The destination endpoint is not administered on the switch where this error is logged.
- e. A request has been made to use a transit network or common carrier that cannot be accessed. Check the routing pattern used by this Administered Connection and verify that the inter-exchange carrier specified is correct.
- f. The exact failure cause is unknown or has been mapped to one of these values. If this is not a temporary condition, try reversing the direction of the Administered Connection (that is, originate the Administered Connection from the destination switch). This may yield another failure cause.

- g. The destination endpoint is not available. Check the status of the destination endpoint (using **status access-endpoint** or **status data-module**) and verify that the endpoint is not busy or otherwise unavailable (for example, out-of-service). The status for the destination endpoint is not available on the switch where this error is logged.
- h. This switch sent an ISDN message to another switch, which either did not respond (18) or did not respond within the allotted time (102). This could be due to link failure or congestion or outage at the other switch.
- i. The address of the destination endpoint has changed. Verify that the new address is correct and change the Administered Connection accordingly. The destination endpoint is not administered on the switch logging this error.
- j. Indicate that a resource (for example, a circuit or bearer capability) required by the administered connection is not presently available.
- k. A network failure (38) or temporary failure (41) has occurred. Error Log entries for other maintenance objects (for example, DS1-BD or ISDN-LNK) may indicate a local problem.
- l. A request to use a network service has been denied because the service has not been purchased. Check the routing pattern used by this Administered Connection and verify that the service type is correct. If the service type appears correct, check with the customer or network provider or both to determine what services have been purchased by the customer.
- m. Indicate that outgoing calls may be barred on the originating switch (52) or that incoming calls may be barred on the destination switch (54). To restore an administered connection failure, issue the **status administered connection** command for current administered connection state (observe the retry count). If the administered connection state is "failed," then verify and correct the Administered Connection Administration Form.
- n. The requested bearer capability (65), channel type (66), or facility (69) is not implemented or is unknown to the network. Check the address of the destination endpoint and the routing pattern used by this Administered Connection, and verify that they are correct and available.
- o. These errors indicate that an ISDN protocol error has occurred.
- p. The destination endpoint (or some intermediate facility) is not compatible with the originating endpoint. Check the BCC fields of the routing pattern used by this Administered Connection. Also, check if the originating and destination endpoints are compatible (for example, the originating access endpoint is voice-grade data, and the destination access endpoint is 64k data).

ADX8D-BD (AUDIX Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run¹	Full Name of MO
ADX8D-BD	MINOR or WARNINGS	test board PCSS sh	AUDIX Circuit Pack

- ¹ *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21).

The ADX8D-BD maintenance object represents a TN566/TN2169 DEFINITY AUDIX circuit pack (sometimes called Embedded AUDIX) operating in digital-port (DP) mode. For circuit pack problems, see “XXX-BD (Common Port Circuit Pack)”. Port level problems are covered by ADX8D-PT.

DEFINITY AUDIX consists of two circuit packs that occupy 5 slots on a port cabinet. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

ADX8D-PT (AUDIX Digital Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run ¹	Full Name of MO
ADX8D-PT	MINOR	test port PCSSpp l	AUDIX Digital Port
ADX8D-PT	WARNING	test port PCSSpp sh	AUDIX Digital Port

- 1 *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21). *pp* is the two digit port number (01, 02, ...).

The ADX8D-PT maintenance object represents a port on a TN566/TN2169 DEFINITY AUDIX circuit pack (sometimes called Embedded AUDIX) operating in digital-port (DP) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction Board (MFB) and the TN2169 Alarm Board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as "AUDIX-reserved" slots (or ADXDP-RS/ADX8D-RS.)

In DP mode the TN566 pack supports up to 8 voice ports, each with a primary information channel and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, DEFINITY AUDIX is not an adjunct.

CAUTION:

Never do any of the following without first shutting down AUDIX. Follow instructions on the TN566/TN2169 faceplate:

- *Remove DEFINITY AUDIX circuit packs*
- *Cycle power to a carrier containing DEFINITY AUDIX circuit packs*
- *Remove power to a carrier containing DEFINITY AUDIX circuit packs*

Error Log Entries and Test to Clear Values

Table 10-9. DEFINITY AUDIX Digital Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port PCSSpp sh r 1
1(a)	40987	None	WARNING	OFF	
1(b)	1 to 20	None	WARNING	OFF

1793		Voice & Ctrl. Local Loop Test (#13)	MIN/WRN ²	ON	test port PCSSpp l r 3
2049		NPE Crosstalk Test (#9)	MIN/WRN ²	ON	test port PCSSpp l r 3
2305(j)	40967	None			
3840(k)	40965	None			
3840(l)	41029	None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- The user may experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.
- At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note (a).
- This is an internal type error that occurs when an audit request fails.
- The port is busied-out by command. You can release the port via the **release port PCSSpp** command.

- e. The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.
- f. The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the AUDIX circuit pack (see p caution at the beginning of this section).
- g. Something is interfering with transmitting to the voice port. This is usually an on-board problem and can be ignored if no user complaints are received.
- h. AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Check out the AUDIX system referring *DEFINITY AUDIX System Maintenance*, 585-300-110, if necessary.
- i. An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if no user complaints are received. If the problem persists, replace the circuit pack (see precaution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.
- j. The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.
- k. No voice ports are connected to the DEFINITY AUDIX circuit pack. No maintenance action is required.
- l. The message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when you are inspecting errors in the system. By clearing error codes associated with the *Voice and Control Channel Local Loop Around Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Voice and Control Channel Local Loop Around Test (#13)		X	ND
NPE Crosstalk Test (#9)		X	ND

¹ D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to DEFINITY AUDIX. These are referred to as *NO-OP* tests, and they always return PASS.

- Electronic Power Feed Test (#11)

- Station Lamp Updates Test (#16)
- Station (Digital) Audits Test (#17)

NPE Crosstalk Test (#9)

This test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence, and it takes about 20 to 30 seconds to complete.

Crosstalk testing is performed on both the primary information channel (voice) and on the secondary information channel (data) associated with each DEFINITY AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 10-10. TEST #9 NPE Crosstalk Test

Error Code	Test Result	Description/Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test. <ol style="list-style-type: none"> 1. Check the port status. Use the display port PCSSpp command to determine the voice port extension of the port. 2. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times..
2	ABORT	System resources may not have been available, or the port may have been busy during the test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times..
1000	ABORT	System resources required to run this test are not available. The port may be in use. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the voice port extension of the port. 2. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle before retesting. 3. When the port it idle, retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required to run this test are not available. Try (a).

Table 10-10. TEST #9 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose any active TDM-BUS errors. <ol style="list-style-type: none"> <li data-bbox="291 444 1072 498">1. If system has no TDM-BUS errors, and if it is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out-of-service. <ol style="list-style-type: none"> <li data-bbox="291 623 643 650">1. Resolve any "TTR-LEV" errors. <li data-bbox="291 664 650 691">2. Resolve any "TONE-PT" errors. <li data-bbox="291 706 996 732">3. Retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was put in use during the test. The test has been aborted. Use the display port PCSSpp command to determine the voice port extension of the port. Use the status station command to determine the service state of the port. If the port is in use, wait until the port is idle before testing.
1020	ABORT	Test disabled by background testing. Use the status station command to determine when the voice port is available for testing.
2000	ABORT	Response to the test request was not received within the allowable time period. <ol style="list-style-type: none"> <li data-bbox="291 1028 996 1055">1. Retry the command at 1-minute intervals a maximum of 5 times.
1 2	FAIL	The NPE of the tested port is transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel. <ol style="list-style-type: none"> <li data-bbox="291 1207 587 1234">1. Replace the circuit pack.
	PASS	The port is using its allocated time slots correctly. <ol style="list-style-type: none"> <li data-bbox="291 1297 1084 1351">1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of 10 times to make sure it continues to pass. <li data-bbox="291 1365 839 1392">2. If complaints still exist, examine the connections.

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the Switch Processing Element (SPE) and the DEFINITY AUDIX port circuit. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Loop Around Test is performed. The Loop Around Test for the secondary information (data) channel is then performed. This test is the same as the primary information channel loop around test.

Next, a Conference Test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 10-11. TEST #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description/Recommendation
	ABORT	Internal System Error. Try (a).
1000	ABORT	System resources required to run this test are not available. The port may be in use. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the voice port extension of the port. 2. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle before retesting. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required for this test are not available. Try (a).
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or may have time slots that are out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose TDM-BUS errors. <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors, and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times..
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out-of-service. <ol style="list-style-type: none"> 1. Resolve any "TTR-LEV" errors. 2. Resolve any "TONE-PT" errors. 3. If neither condition exists, try (a).

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run¹	Full Name of MO
ADX16D-B	MINOR	test board PCSS sh	AUDIX Circuit Pack
ADX16D-B	WARNING	test board PCSS sh	AUDIX Circuit Pack

- ¹ *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21).

The ADX16D-BD maintenance object represents a TN566/TN2169 DEFINITY AUDIX circuit pack combination operating in 16 port mode digital (DP). For circuit-pack-level problems, see “XXX-BD (Common Port Circuit Pack)”. Port-level maintenance is covered by ADX16D-PT.

DEFINITY AUDIX consists of 2 circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

ADX16A-BD (AUDIX Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run ¹	Full Name of MO
ADXCL-BD or VADX16A-BD	MINOR, or WARNINGS	test board PCSS sh	AUDIX Circuit Pack

1 *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21).

The ADX16A-BD maintenance object represents a TN566/TN2169 DEFINITY AUDIX circuit pack combination operating in control-link (CL) mode. For circuit-pack-level problems, see “XXX-BD (Common Port Circuit Pack)”. Port-level maintenance is covered by ADX16A-PT.

DEFINITY AUDIX consists of 2 circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

ADX16D-P (16-Port AUDIX Digital Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run ¹	Full Name of MO
ADX16D-P	MINOR or WARNINGS	test port PCSSpp I	AUDIX Digital Port

- 1 *UU* is the universal cabinet number (1 for PPN, 2-44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21). *pp* is the two digit port number (01, 02, ...).

CAUTION:

Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:

- *Remove DEFINITY AUDIX circuit packs*
- *Cycle power to a carrier containing DEFINITY AUDIX circuit packs*
- *Remove power to a carrier or cabinet containing DEFINITY AUDIX circuit pack.*

The ADX16D-P maintenance object represents a port on a TN566/TN2169 DEFINITY AUDIX circuit pack operating in digital-port (DP) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction Board (MFB) and the TN2169 Alarm Board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the system is concerned. The other 4 slots are seen by the switch as "AUDIX-reserved" slots (or ADX16-RES/ADX16D-RS).

In 16 Port DP mode, the TN566 pack supports up to 16 voice ports, each with a primary information channel and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, DEFINITY AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 10-12. DEFINITY AUDIX Digital Port Error Log Entries

3840(l)	41029	None			

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Minor alarms may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. The user may experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.
- b. At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note a, above.
- c. This is an internal type error that occurs when an audit request fails.
- d. The port is busied-out by command. Release the port with the **release port PCSSpp** command.

- e. The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.
- f. The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reseal or replace the AUDIX circuit pack (see caution at the beginning of this section).
- g. Something is interfering with transmitting to the voice port. This is usually an on-board problem and can be ignored if no user complaints are received.
- h. AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Refer to *DEFINITY AUDIX System Maintenance*, 585-300-110, if necessary.
- i. An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if no user complaints are received. If the problem persists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.
- j. The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.
- k. No voice ports are connected to the DEFINITY AUDIX circuit pack. No maintenance action is required.
- l. The message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Voice and Control Channel Local Loop Around Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Voice and Control Channel Local Loop Around Test (#13)		X	ND
NPE Crosstalk Test (#9)		X	ND

¹ D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to DEFINITY AUDIX. These tests always return PASS.

- Electronic Power Feed Test (#11)

- Station Lamp Updates Test (#16)
- Station (Digital) Audits Test (#17)
- Digital Terminal Remote Loop Around Test (1201)

NPE Crosstalk Test (#9)

This test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence, and it takes about 20 to 30 seconds to complete.

Crosstalk testing is performed on both the primary information channel (voice) and on the secondary information channel (data) associated with each DEFINITY AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 10-13. TEST #9 NPE Crosstalk Test

Error Code	Test Result	Description/Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test. <ol style="list-style-type: none"> 1. Check the port status (display port PCSSpp) to determine the voice port extension of the port. 2. Use the status station command to determine the service state of the port. If the port is in use, it is unavailable for this test. Wait until the port is idle. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
2	ABORT	System resources may not have been available, or the port may have been busy during the test. <ol style="list-style-type: none"> 1. Check if port is being used (status station). 2. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.

The system may be oversized for the number of tone detectors present, or some tone detectors may be out-of-service. <ol style="list-style-type: none"> 1. Resolve any "TTR-LEV" errors in the Error Log. 2. Resolve any "TONE-PT" errors in the Error Log.
1004	ABORT	The port was put in use during the test. The test has been aborted. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the voice port extension of the port. 2. Use the status station command to determine the service state of the port. If the port is in use, it is unavailable for certain tests. Wait until the port is idle before testing. 3. When the port it idle, retry the command at 1-minute intervals a maximum of 5 times.
1020	ABORT	Test disabled via background testing. <ol style="list-style-type: none"> 1. Use the status station command to determine when the voice port is available for testing. 2. When the port it idle, retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-13. TEST #9 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/Recommendation
1 2	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel. <ol style="list-style-type: none"> 1. Replace the circuit pack (see caution at the beginning of this section).
	PASS	The port is using its allocated time slots correctly. <ol style="list-style-type: none"> 1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of 10 times to make sure it continues to pass. 2. If complaints still exist, examine the connections.

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the Switch Processing Element (SPE) and the DEFINITY AUDIX port circuit. The SPE sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Loop Around Test is performed. The Loop Around Test for the secondary information (data) channel is then performed. This test is the same as the primary information channel loop around test.

Next, a Conference Test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 10-14. TEST #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description/Recommendation
	ABORT	Internal System Error <ol style="list-style-type: none"> 1. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.

Table 10-14. TEST #13 Voice and Control Channel Local Loop Test — Continued

Error Code	Test Result	Description/Recommendation
7	FAIL	Conference Test failed on the primary channel. In some cases, users may not notice a disruption in service. In extreme cases, the conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.
15	FAIL	The control channel between the processor and AUDIX is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port. This failure could also be disruptive to other users.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port.
None	FAIL	The test failed for reasons external to the AUDIX. <ol style="list-style-type: none"> 1. Run circuit pack tests to check the tone generator circuit pack and the tone detector circuit pack by using the test board PCSS s command. 2. Resolve any problems detected on the tone generator circuit pack or tone detector circuit pack. 3. If the tone generator and tone detector circuit packs are functioning properly, and if the test still fails, replace the AUDIX (see caution at the beginning of this section).
	PASS	Voice and Control Channel Local Loop test passed. All channels are transmitting properly. <ol style="list-style-type: none"> 1. To be sure that this is not an intermittent problem, repeat this test up to 10 times and see if it continues to pass. 2. If complaints still exist, examine the connections.

ADX16A-PT (AUDIX Analog Line/Control Link)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run ¹	Full Name of MO
ADXCL-PT or ADX16A-PT	MINOR	test port PCSSpp l	AUDIX Analog Line/ Control Link
ADXCL-PT or ADX16A-PT	WARNING	test port PCSSpp sh	AUDIX Analog Line/ Control Link

1 UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21). pp is the two digit port number (01, 02, ...).

CAUTION:

Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:

- *Remove DEFINITY AUDIX circuit packs*
- *Cycle power to a carrier containing DEFINITY AUDIX circuit packs*
- *Remove power to a carrier containing DEFINITY AUDIX circuit packs*

The ADX16A-PT maintenance object represents a port on a TN566/TN2169 DEFINITY AUDIX circuit pack that is operating in control-link (CL) mode. For circuit-pack-level problems (ADX16A-BD or ANL-16-BD), see “XXX-BD (Common Port Circuit Pack)”. For port-level problems with AUDIX operating in digital-port mode, see ADXDP-PT/ADX8D-PT.

The tests described in this section apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction Board (MFB) and the TN2169 Alarm Board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as “AUDIX-reserved” slots.

In CL mode the TN566 pack supports up to 16 voice ports. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, DEFINITY AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 10-15. DEFINITY AUDIX Analog Line/Control Link Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. This is an in-line error and can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port PCSSpp** command.
- b. The circuit pack has been logically administered but not physically installed. The alarm will be cleared when the circuit pack is installed.
- c. The circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack.
- d. This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one analog circuit pack in the system has this problem, then replace the circuit pack. If only analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, check the ringing generator.

- e. AUDIX is not available to the switch. Check the AUDIX system, referring to *DEFINITY AUDIX System Maintenance*, 585-300-110.
- f. The TDM bus is out of service. See the "TDM-BUS" section.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Loop Around Test #161* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND¹
Loop Around Test (#161)		X	ND
Conference Test (#7)		X	ND
NPE Crosstalk Test (#6)		X	ND

¹ D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for ANL-16-L. The tests listed below apply only to ANL-16-L and not to DEFINITY AUDIX. These tests always return PASS.

- Battery Feed Test (#35)
- Audits and Updates Test (#36)
- Station Present Test (#48)

Tests 36 and 48 ABORT when AUDIX is not running.

NPE Crosstalk Test (#6)

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of the long test sequence and takes about 25 seconds to complete.

Table 10-16. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources for this test. Try (a).
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. If the port is in use, it is unavailable for certain tests. Wait until the port is idle before testing. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. Try (a).
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS Maintenance documentation to diagnose any active TDM-BUS errors. <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service. <ol style="list-style-type: none"> 1. Resolve any "TTR-LEV" errors. 2. Table 10-16. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/ Recommendation
1018	ABORT	Test disabled via administration. 1. To enable the test for the particular analog station being tested, enter the change station <extension> command and change the "Test?" field on the Station Form from "n" to "y."
2000	ABORT	Response to the test request was not received within the allowable time period.
2012	ABORT	System could not respond to this request.
2100	ABORT	Could not allocate the necessary system resources for this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

Conference Circuit Test (#7)

This test verifies that the NPE channel for the port being tested can correctly perform the conferencing function.

Table 10-17. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. (a)

Continued on next page

Table 10-17. TEST #7 Conference Circuit Test — Continued

Error Code	Test Result	Description/Recommendation
1000	ABORT	System resources required to run test are not available. The port may be busy with a valid call. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. If the port is in use, wait until it is idle before retesting. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. If the port is in use, wait until it is idle before testing. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1018	ABORT	Test disabled by administration. This only applies to analog stations. <ol style="list-style-type: none"> 1. To enable the test for the analog station being tested, enter the change station <extension> command and change the Test? field on the Station Form from n to y.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources for this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

Loop Around Test (#161)

This test is designed to check the on-board transmission capabilities of the NPE on the analog port.

Table 10-18. TEST #161 Loop Around Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources for this test. Try (a).
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. If the port is in use, wait until it is idle before testing. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose TDM-BUS errors. <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service. <ol style="list-style-type: none"> 1. Resolve any "TTR-LEV" errors. 2. Resolve any "TONE-PT" errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. <ol style="list-style-type: none"> 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. If the port is in use, wait until the port is idle before testing. 3. When the port is idle, retry the command at 1-minute intervals a maximum of 5 times.
1018	ABORT	Test disabled by administration. To enable the test for the particular analog station being tested, enter the change station <extension> command and change the Test? field on the Station Form from n to y .
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources for this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-18. TEST #161 Loop Around Test — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	The reflective Loop Around Test failed. This causes noisy or unreliable connections or other users calling this port may hear an echo. 1. Replace the circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

ALARM-PT (ALARM PORT)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ALARM-PT	MIN	test port PCSSpp l	Alarm-Port
ALARM-PT	WRN	test port PCSSpp sh	Alarm-Port

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The Alarm Port Maintenance Object provides on-board maintenance for an analog line port that is administered as an external device alarm port. Tests are provided to verify the analog line port's ability to detect an external device alarm. The External Device Alarm (EXT-DEV) Maintenance Object is used for the off-board external device alarm.

ANL-24-L (24-Port Analog Line)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ANL-24-L	MIN	test port PCSSpp l	24-Port Analog Line
ANL-24-L	WRN	test port PCSSpp sh	24-Port Analog Line

- 1 Where P is the port network number (1 for PPN); C is the carrier designation (for example, A, B, or C); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The 24-Port Analog Line circuit pack (TN793) provides 24 ports for voice terminals and supports both on-premises and off-premises analog voice terminals.

No maintenance of the terminal connected to the 24-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of common port circuit pack errors. See errors 1281 and 1793 in the "XXX-BD (Common Port Circuit Pack)" section.

⇒ NOTE:

This analog line circuit pack supports analog data modules. When assigned, analog data modules provide access to the Net Pkt (TN794) data ports. To activate an analog data module you must assign the port location on the data form and connect a modem to the port. (The analog data module may be used for connection to a CDR output or other adjuncts as needed.) These ports are tested the same as all other analog ports on the circuit pack.

Ringling Caused by Maintenance Testing

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled in the `TESTS` field of the **change station** extension form. Be aware that this action also disables Tests #6, 7, 161, and 35.

Error Log Entries and Test to Clear Values

Table 10-19. 24-Port Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port PCSSpp sh r 1
1(a)	40960 40975 40977	none			
15(b)	Any	Audits and Updates Test (#36)			
18	0	busy-out station <i>extension</i>	WRN	ON	release station <extension>
130(c)		None	WRN	ON	test port PCSSpp sh
257(d)	40973	none			
513(e)		Station Present Test (#48)	WRN	OFF	test port PCSSpp sh r 2
769		Battery Feed Test (#35)	MIN/ WRN ²	ON	test port PCSSpp sh r 2
1025		Looparound Test (#161)	MIN/ WRN ²	ON	test port PCSSpp l r 2
1281		Conference Test (#7)	MIN/ WRN ²	ON	test port PCSSpp l r 2
1537		NPE Crosstalk Test (#6)	MIN/ WRN ²	ON	test port PCSSpp l r 2

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. Error Type 1: These are in-line errors and can only be resolved over time.
 - 40960 indicates that too many simultaneous incoming ringing attempts were made on this board. Only 4 ports on a board may ring simultaneously. A 5th incoming call will cause an inline error from the board.
 - 40975 indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal

rings. If the terminal does not ring, then replace it. Otherwise, issue the **test port PCSSpp** command, and follow the procedure for Test #48.

- 40977 indicates that no terminal equipment was connected when ringing was attempted. Run the short test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.
- b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors.
- c. This error type indicates that the circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reseal or replace the circuit pack.
- d. This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only 1 analog circuit pack in the system has this problem, then replace the circuit pack. If only analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.
- e. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this disturbs the customer or the terminal equipment, disable it by setting the `Tests` field on the **change station** extension form to `n`. On some software releases, this will also disable Tests #6, 7, 161, and 35.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed Test (#35)	X	X	ND
Station Present Test (#48)	X	X	ND
Looparound Test (#161)		X	ND
Conference Test (#7)		X	ND
NPE Crosstalk Test (#6)		X	ND
Station Status and Translation Audits and Updates Test (#36)	X	X	ND

¹ D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

This test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually part of the long test sequence and takes about 20 to 30 seconds to complete.

Table 10-20. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run test are not available. The port may be busy with a valid call. This result is also reported for the system's Music-On-Hold port when it is off-hook, which it usually is. 1. Enter display port PCSSpp to determine the station's extension. 2. Enter status station extension to determine the service state of the port. If the port is in use, wait until the port is idle. 3. Retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required to run test are not available. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV". 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT". 3. Retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the port is in use, wait until the port is idle before testing. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-20. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/Recommendation
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1018	ABORT	<p>The test has been disabled by administration. The default for the <code>Test</code> field on the station form is <code>y</code>. Determine why this field has been set to <code>n</code> on this station (this may be due to the ringing application test 48, that can be customer or terminal disturbing).</p> <ol style="list-style-type: none"> To enable the test for a particular station being tested, enter change station extension and set the <code>Test?</code> field on the station form <code>n</code> to <code>y</code>.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	<p>System resources required to run test are not available. This could be due to a failure to seize the port.</p> <ol style="list-style-type: none"> Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	<p>This test can fail due to on-board or off-board problems. Off-board problems include EXP-PN and EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. A TDM-BUS problem is usually the result of a faulty board connected to the backplane, or bent pins on the backplane.</p> <ol style="list-style-type: none"> Look for EXP-PN and/or EXP-INTF errors in the error log. If present, refer to “EXP-PN” and “EXP-INTF”. Look for TDM-BUS errors in the error log. If present, refer to “TDM-BUS”. Look for TONE-BD and/or TONE-PT errors in the error log. If present, refer to “TONE-BD” and “TONE-PT”. Test the board when the faults from Steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to ensure that there is a valid board inserted.

Battery Feed Test (also called Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery and detecting the resulting current.

For the TN746B, Test #35 does not actually run and instead always returns PASS. Test #35 operates in the normal manner for TN746.

Table 10-22. TEST #35 Battery Feed Test

Error Code	Test Result	Description/Recommendation
	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-23. Test #36 Station Status and Translation Audits and Updates — Continued

Error Code	Test Result	Description/ Recommendation
5	FAIL	This may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. There may be an internal software error. The ringer update was not performed because of this failure.
8	FAIL	This does not indicate a hardware problem. There may be an internal software error. The ringer update failed. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure the board translations are correct. Use the list config command and resolve problems. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to ensure that there is a valid board inserted.

Station Present Test (also called Ringing Application Test) (#48)

This test applies momentary ringing voltage to the terminal equipment and monitors resulting current flow to determine whether terminal equipment is connected to the port. This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing disturbs the customer or the terminal equipment, you can disable it via the Tests field on the **change station** form. However, on some software releases, Tests #6, 7, 161, and 35 are disabled.

Table 10-24. TEST #48 Station Present Test

Error Code	Test Result	Description/Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000 1004	ABORT ABORT	System resources required to run this test are not available. The port may be busy with a valid call. The port was seized by a valid call during the test. The test has been aborted. 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. 3. If the port is in use, wait until the port is idle and retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or Music On Hold).
1008	ABORT	Could not allocate a ringing circuit. Either all the ringing circuits are in use or the ringing generator is defective or it is not wired correctly. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is not wired correctly (see errors for RING-GEN). If it does not occur on other ports, then all four ring phases are in use.
1018	ABORT	The test has been disabled by administration. The default for the <code>Test</code> field on the station form is y . Determine why this field has been set to n on this station (this may be due to the brief ringing disturbance that this test may cause). 1. To enable the test for a particular station being tested, enter change station extension and set the <code>Test?</code> field on the station form from n to y .
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-24. TEST #48 Station Present Test — Continued

Error Code	Test Result	Description/Recommendation
	FAIL	<p>The terminal equipment is not connected to the circuit pack. Some terminal equipment, such as modems, may fail even when connected properly.</p> <ol style="list-style-type: none"> 1. Remotely test the equipment. 2. If the test fails again, look for RING-GEN errors in the error log. If present, refer to "RING-GEN". 3. Check all of the wiring between the station equipment and the switch. Then, run the test again. 4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary. 5. Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using the change station extension command (enter n into the Test field). Note that this action also disables tests 6, 7, 161, and 35 on this port.
	PASS	<p>The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to ensure that there is a valid board inserted.

Looparound Test (#161)

This test checks the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. The test passes if the signal measured by the tone detector is within acceptable limits.

Table 10-25. TEST #161 Looparound Test

Error Code	Test Result	Description/Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. 3. If the port is in use, wait until the port is idle and retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV". 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT". 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. 1. Use the display port PCSSpp command to determine the station extension. 2. Use the status station command to determine the service state of the port. 3. If the port is in use, wait until the port is idle and retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	This test is not run on ports administered as External Alert, Announcement or combined modem pool ports. This error can be ignored.
1018	ABORT	The test has been disabled by administration. The default for the Test field on the station form is y. Determine why this field has been set to n on this station (this may be due to the ringing application test 48, that can be customer or terminal disturbing). 1. To enable the test for a particular station being tested, enter change station extension and set the Test? field on the station from n to y.

Table 10-25. TEST #161 Looparound Test — Continued

Error Code	Test Result	Description/Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	<p>Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	<p>The reflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board.</p> <ol style="list-style-type: none"> 1. Since the test may be affected by a line seizure, repeat the test at 1-minute intervals for a maximum of 5 times. 2. Run circuit pack tests to check the tone generator circuit pack and the tone detector circuit pack by using the test board PCSS short command. 3. Resolve any problems on the tone generator circuit pack or the tone detector circuit pack. 4. If the tone generator and tone detector circuit packs are functioning properly, a voice terminal is connected and wired properly and the test still fails, replace the analog line circuit pack.
	PASS	<p>The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command and resolve any problems. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to ensure that there is a valid board inserted.

ANL-16-L (16-Port Neon Analog Line)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ANL-16-L	MIN	test port PCSSpp l	16-Port Neon Analog Line
ANL-16-L	WRN	test port PCSSpp sh release station <ext>	16-Port Neon Analog Line

- ¹ Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The following are 16-Port Analog Line circuit packs:

TN746	TN746B
TN468 [G3iV2-386]	TN749 [G3iV2-386]
TN468B [G3iV2-386]	TN2135 [G3iV2-386]
TN2144 [G3iV2-386]	TN2149 [G3iV2-386]

These circuit packs provide 16 ports for analog voice terminals. The TN746, TN468, and TN749 support only single-line, on-premises/in-building, analog voice terminals, and not off-premises stations, since these circuit packs are not equipped with lightning protection. The TN746B, TN2144, TN2149, and TN468B support both on-premises and off-premises (that is, out-of-building) analog voice terminals. The TN468, TN468B, TN749, TN2135, TN2144, and TN2149 do NOT support the neon message waiting feature.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station <extension>** command. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

No maintenance of the terminal connected to the 16-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

Hardware Error Log Entries and Test to Clear Values

Table 10-26. 16-Port Neon Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port PCSSpp sh r 1
1 (a)	40960 40977	none			
15 (b)	Any	Audits and Updates Test (#36)			
18	0	busyout station <extension>	WRN	ON	release station <extension>
130 (c)		None	WRN	ON	test port PCSSpp sh
257 (d)	40973	none			
513 (e)		Station Present Test (#48)	WRN	OFF	test port PCSSpp sh r 2
769		Battery Feed Test (#35)	MIN/WRN ²	ON	test port PCSSpp sh r 2
1025		Loop Around Test (#161)	MIN/WRN ²	ON	test port PCSSpp l r 2
1281		Conference Test (#7)	MIN/WRN ²	ON	test port PCSSpp l r 2
1537		NPE Crosstalk Test (#6)	MIN/WRN ²	ON	test port PCSSpp l r 2

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. This is an in-line error and can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port PCSSpp** command, and follow the procedure for the results of Test #48.
 - 40960—indicates that too many simultaneous incoming ringing attempts were made on this board. Only four ports on a board may be ringing simultaneously. A fifth incoming call will cause an inline error from the board.

- 40977—indicates that no terminal equipment was connected when ringing was attempted. Run the short Test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.
- b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).
- c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- d. This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one Analog circuit pack in the system has this problem, then replace the circuit pack. If only Analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If Analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.
- e. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the **change station <extension>** command. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed Test (#35)	X	X	ND
Station Present Test (#48)	X	X	ND
Loop Around Test (#161)		X	ND
Conference Test (#7)		X	ND
NPE Crosstalk Test (#6)		X	ND
Station Status and Translation Audits and Updates Test (#36)	X	X	ND

¹ D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-27. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is idle, retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required to run this test are not available. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.

Table 10-27. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/ Recommendation
1004	ABORT	<p>The port was seized by a valid call during the test. The test has been aborted. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	<p>The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).</p>
1018	ABORT	<p>The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing).</p> <ol style="list-style-type: none"> 1. To enable the test for a particular station being tested, enter change station extension and set the 'Test?' field on the station from 'n' to 'y.'
2000	ABORT	<p>Response to the test request was not received within the allowable time period.</p>
2100	ABORT	<p>System resources required to run this test are not available. This could be due to a failure to seize the port.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	<p>This test can fail due to on-board or off-board problems. Off-board problems of concern include EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane.</p> <ol style="list-style-type: none"> 1. Look for EXP-INTF errors in the error log. If present, refer to the EXP-INTF Maintenance documentation. 2. Look for TDM-BUS errors in the error log. If present, refer to the TDM-BUS Maintenance documentation. 3. Look for TONE-BD and/or TONE-PT errors in the error log. If present, refer to the TONE-BD Maintenance documentation and the TONE-PT Maintenance documentation. 4. Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.

Continued on next page

Table 10-27. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/ Recommendation
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Conference Circuit Test (#7)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 10-28. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

If present, refer to the TONE-PT Maintenance documentation. 2. If there are no TONE-PT errors in the error log, retry the test at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 10-28. TEST #7 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This will cause noisy and unreliable connections. <ol style="list-style-type: none"> 1. Issue the display port and the status station commands to determine if the station is idle. If the station is found to be idle, issue the test port command for this port. 2. If the test continues to fail, issue the busyout port and the release port commands, and then retest the port. 3. If the test still fails, replace the board.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Battery Feed Test (also called Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and by trying to detect a current.

NOTE:

For the TN746B 16-Port Neon Analog Line circuit pack, Test #35 always “passes.” No actual testing is performed on the TN746B while the test is running. Test #35 operates in the normal manner for TN746.

Table 10-29. TEST #35 Battery Feed Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for the particular analog station being tested, enter change station extension and set the 'Test?' field on the station from 'n' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-29. TEST #35 Battery Feed Test — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This could be a marginal test, and the terminal equipment may be operating satisfactorily. <ol style="list-style-type: none"> 1. Retry the test at 1-minute intervals for a maximum of 5 times. 2. If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.
	PASS	The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook, but may not be able to supply power for touch-tones. If touch-tones are inoperative on this station, then replace the circuit pack because this port is inoperative. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Status and Translation Audits and Updates Test (#36)

This test updates the Analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Table 10-30. TEST #36 Station Status and Translation Audits and Updates Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).
1006	ABORT	This port has been busied out by command, or taken out-of-service by the failure of the NPE Crosstalk Test. 1. Look in the error log for error type 18 (port busied out) for this port. If this error is present, release the port with the release station extension command, and run the test again. 2. Look in the error log for error type 1025 (NPE crosstalk test failed) for this port. If this error is present, investigate the errors associated with the NPE Crosstalk Test 6. 3. Make sure that the terminal is connected and in service, and then retest.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed. The other updates were not performed because of this failure. This may occur when the audit is performed at the same time that the terminal equipment goes off-hook. Use the status station command to determine when the port is available for testing. 1. When the port becomes available for testing, retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-30. TEST #36 Station Status and Translation Audits and Updates Test — Continued

Error Code	Test Result	Description/ Recommendation
5	FAIL	This does not indicate a hardware problem. However, there may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. This does not indicate a hardware problem. However, there may be an internal software error. The ringer update was not performed because of this failure.
8	FAIL	This does not indicate a hardware problem. However, there may be an internal software error. The ringer update failed. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Present Test (also called Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test ascertains whether terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen form. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

Table 10-31. TEST #48 Station Present Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).
1008	ABORT	Could not allocate a ringing circuit. Either all the ringing circuits are in use or the ringing generator is defective or it is not wired correctly. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is not wired correctly (see errors for RING-GEN). If it doesn't occur on other ports, then all four ring phases are in use.
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the brief ringing disturbance that this test may cause). 1. To enable the test for the particular analog station being tested, enter change station extension and set the 'Test?' field on the station from 'n' to 'y.'

Table 10-31. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The terminal equipment is not connected to the circuit pack. Some terminal equipment such as modems may fail even when connected properly. <ol style="list-style-type: none"> 1. Remotely test the equipment. 2. If the test fails again, look for RING-GEN errors in the error log. If present, refer to the RING-GEN (analog ring generator) Maintenance documentation. 3. Check all of the wiring between the station equipment and the switch. Then, run the test again. 4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary. 5. Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using the change station extension command (enter 'n' into the Test field). Note that this action also disables tests 6, 7, 161, and 35 on this port.
	PASS	The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Loop Around Test (#161)

Each Analog port consists of:

- an NPE for port connectivity and gain, and conferencing functionality
- a code that converts the digital signals of the TDM Bus to analog signals
- a battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance

This test is designed to check the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see the following below). The test passes if the signal measured by the Tone Detector is within acceptable limits.

* BFC - BATTERY FEED CHIP

NPE - NETWORK PROCESSING ELEMENT

Figure 10-2. Analog Loop Around Test

Table 10-32. TEST #161 Loop Around Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to the "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to the "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test is not run because the port is administered as either an External Alert or Announcement port.

Continued on next page

Table 10-32. TEST #161 Loop Around Test — Continued

Error Code	Test Result	Description/ Recommendation
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). <ol style="list-style-type: none"> To enable the test for the particular analog station being tested, enter change station extension and set the 'Test?' field on the station from 'n' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. <ol style="list-style-type: none"> Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The reflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below. <ol style="list-style-type: none"> Since the test may be affected by a line seizure, repeat the test at 1-minute intervals for a maximum of 5 times. Run circuit pack tests to check the tone generator circuit pack and the tone detector circuit pack by using the test board PCSS short command. Resolve any problems that are detected on the tone generator circuit pack or the tone detector circuit pack. If the tone generator and tone detector circuit packs are functioning properly and the test still fails and a voice terminal is connected and wired properly, replace the analog line circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

ANL-BD (Analog Line Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ANL-BD	MIN	test board PCSS sh	8-Port Analog Line Circuit Pack
ANL-BD	WRN	test board PCSS sh	8-Port Analog Line Circuit Pack
ANL-BD	MIN	test board PCSS sh	8-Port Neon Analog Line Circuit Pack
ANL-BD	WRN	test board PCSS sh	8-Port Neon Analog Line Circuit Pack
ANL-BD	MIN	test board PCSS sh	16-Port Neon Analog Line Circuit Pack
ANL-BD	WRN	test board PCSS sh	16-Port Neon Analog Line Circuit Pack

- 1 Where P is the port network number (1 for PPN and 2 or [G.1] 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to “XXX-BD (Common Port Circuit Pack)” Maintenance documentation for circuit pack level errors. See also “ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)”, and “ANL-16-L (16-Port Neon Analog Line)” Maintenance documentation for related line information.

10 Maintenance Object Repair Procedures

ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)

10-80

ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ANL-LINE	MIN	test port PCSSpp l	8-Port Analog Line
ANL-LINE	WRN	test port PCSSpp sh	8-Port Analog Line
ANL-NE-L	MIN	test port PCSSpp l	8-Port Neon Analog Line
ANL-NE-L	WRN	test port PCSSpp sh	8-Port Neon Analog Line

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The 8-Port Analog Line circuit packs are:

TN742	TN431 [G3iV2-386]
TN769	TN443 [G3iV2-386]
TN712	TN467 [G3iV2-386]
	TN411 [G3iV2-386]

These circuit packs provide eight ports for single line on-premises or off-premises analog endpoints such as analog voice terminals, queue warning level lamps, recorded announcements, dictation machines, PagePac™ paging equipment, external alerting devices, modems, facsimile machines, and AUDIX voice ports. The TN769 supports a neon message waiting lamp. The other eight-port analog lines do not support the lamp.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, #47, and #35 as well as Test #48. Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this is the case, then the test should be disabled using the Tests field of the **change station <extension>** command.

No maintenance of the terminal connected to the 8-Port Analog Line circuit pack or 8-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power (for ANL-NE-L only) and the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

Hardware Error Log Entries and Test to Clear Values

1281 (f)					
1793 (f)					

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Major or Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. These are in-line errors and can only be resolved over time.
 - 40960—indicates that too many simultaneous incoming ringing attempts were made on this board. Only four ports on a board may be ringing simultaneously. A fifth incoming call will cause an inline error from the board.
 - 40975—indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal

10 Maintenance Object Repair Procedures

ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)

10-82

rings. If the terminal doesn't ring, then replace it. Otherwise, issue the **test port PCSSpp** command, and follow the procedure for Test #48.

- 40977—indicates that no terminal equipment was connected when ringing was attempted. Run the Short Test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.
- b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate errors (if any).
- c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- d. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station <extension>** command. However, on some releases of the software, this disables Tests #6, #47, and #35 as well as Test #48.
- e. Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this causes a false alarm, then disable the test by changing the Tests field of the **change station** command to **n**.
- f. Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery Feed Test (#35)	X	X	ND
Station Present Test (#48)	X	X	ND
NPE Crosstalk Test (#6)		X	ND
Loop Around and Conference Test (#47)		X	ND
Station Status and Translation Audits and Updates Test (#36)	X	X	ND

¹ D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-34. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. <ol style="list-style-type: none"> 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. Table 10-34. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	<p>This test can fail due to on-board or off-board problems. Off-board problems of concern include EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane.</p> <ol style="list-style-type: none"> 1. Look for EXP-INTF errors in the error log. If present, refer to the EXP-INTF Maintenance documentation. 2. Look for TDM-BUS errors in the error log. If present, refer to the TDM-BUS Maintenance documentation. 3. Look for TONE-BD and/or TONE-PT errors in the error log. If present, refer to the TONE-BD Maintenance documentation and the TONE-PT Maintenance documentation. 4. Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	<p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises.</p> <p>⇒ NOTE: This test always passes for Analog circuit packs TN712 prior to Vintage 14 and TN742 prior to Vintage 4.</p>
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Battery Feed Test (also called Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

Table 10-35. TEST #35 Battery Feed Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension. Use the status station command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This code will result under either of the following conditions: 1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). 2. The circuit pack is one of the following: — TN742 vintages 13,14 and 15 — TN769 vintages 3,4 and 5

Table 10-35. TEST #35 Battery Feed Test — Continued

Error Code	Test Result	Description/ Recommendation
1018	ABORT	Test disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). <ol style="list-style-type: none"> To enable the test for a particular station, enter change station extension and set the 'Test?' field on the 'Station Form' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization. <ol style="list-style-type: none"> Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This may occur when the test is performed at the same time that the terminal equipment goes off-hook. <ol style="list-style-type: none"> Use status station to determine when the port is available for testing. When the port becomes available for testing, retry the command at 1-minute intervals a minimum of 5 times. If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.
	PASS	The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook. However, the battery feed chip may still be unable to provide power for touch-tones. If tones are heard when buttons are pressed, then the battery feed chip is functioning correctly; otherwise, replace the circuit pack because this port is defective. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. <p> NOTE: This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 prior to Vintage 6.</p>

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Loop Around and Conference Test (#47)

Each Analog Port consists of:

- an NPE for port connectivity and gain, and conferencing functionality
- a code that converts the digital signals of the TDM Bus to analog signals
- a battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance.

This test is designed to check the on-board transmission capabilities of the NPE, the code, and the battery feed chip of the Analog Port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see Figure 10-2). The test passes if the signal measured by the Tone Detector is within acceptable limits.

The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. As part of Test #47, the operation of the port conference circuits in the NPE for three and four parties is also tested. In addition, a test is run to measure noise. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

The noise test is performed by filtering out the tone, and then measuring inherent port noise.

NOTE:

This Loop Around Test is sensitive to the length of the loop, the equipment in the loop, or the equipment terminating the loop, such as off-premises stations. If this test is causing a false alarm, then disable the test by changing the `TESTS` field to `n` using the **change station** command for this station.

2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
7	FAIL	The conference test or the noise test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below.
13		The reflective loop around with gain set to low and the 600-ohm balance failed. This will cause noisy or unreliable connections.
14		The reflective loop around test (with the gain set to high, using RC balance) failed. This could cause noisy or unreliable connections. The problem can also be off-board, as described below.
15		The nonreflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below. <p><i>More information continues on the next page.</i></p>

Continued on next page

Table 10-37. TEST #47 Loop Around and Conference Test — *Continued*

Error Code	Test Result	Description/ Recommendation
7 13 14 15 <i>(cont'd.)</i>	FAIL <i>(cont'd.)</i>	<p>1. Disconnect the terminal equipment from the circuit pack at the cross-connect and run the test again.</p> <p>2. If the test fails again, replace the circuit pack and reconnect the terminal equipment. If the test passes the second time, then the test results were affected by the terminal equipment connected to the port; in this case, ignore the results of this test if all other tests pass or abort and the station is operating properly. Failure of test 47 does not cause an alarm. If there are failures of other tests, then investigate those errors. User reported troubles with this port should be investigated by using other port tests, by examining station wiring, and by examining the station to ensure that it is correctly translated as off-premises or on-premises.</p> <p>⇒ NOTE: If the loop around and conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test.</p>
	PASS	<p>The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises.</p> <p>⇒ NOTE: This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.</p>

Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Present Test (also called Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test is to ascertain whether or not terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, #47, and #35 as well as Test #48.

Table 10-38. TEST #48 Station Present Test

ANN-BD (Announcement Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ANN-BD	MINOR	test board PCSS I	Announcement Circuit Pack
ANN-BD	WRN	test board PCSS I	Announcement Circuit Pack

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN750 Announcement circuit pack is a service circuit which provides a DEFINITY Generic 3 customer with an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (for example, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2]. If there are any errors associated with port 17, refer to “DAT-LINE (Data Line)” Maintenance documentation. If there are any errors associated with any other port, refer to “ANN-PT (Announcement Port)” Maintenance documentation.

⇒ NOTE:

TN750C is required if your system will have multiple announcement boards. To use multiple announcement boards, you must have G3V4 software, and at least one TN750C (up to ten are allowed). Only one TN750A/B may be present in the system when a TN750C is used. The announcements from a TN750A/B can be saved and restored to a TN750C — but once the announcements are recorded onto a TN750C, they are not backward compatible with the TN750A/B.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack and communicates with the switch via the control channel on the TDM Bus. The second processor, or Speech Processor (SP), controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General Notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1. The Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always best to try to reset the circuit pack via the **reset board PCSS** command first. If that does not work, replace the circuit pack. **Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.**
2. **If a customer has announcements on the Announcement circuit pack that cannot be rerecorded easily, then announcements must be saved on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the circuit pack is in proper working order (see Note).

NOTE:

Unlike translations, announcements are NEVER automatically saved to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2].

3. The administration terminal **save announcements** command replaces the announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command and, as a result, destroy a valid file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2].
4. The **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2]. Care must be taken not to mistakenly enter this command, destroying valid speech memory (especially if the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be rerecorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the pack.
6. If announcement speech memory is corrupted, announcements should not be saved [that is, if the Announcement Checksum Test (#209) fails, or if the speech sounds corrupted on playback]. This can ruin a good announcement file on the system tape [G3iV1.1-286] or memory card

[G3sV2, G3iV2-386, G3vsV2] and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2], announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).

7. Due to a hardware fault in the TN750 announcement board, the following sequence of events may cause the announcement file to become corrupted and unusable:
 - Fill the board with recorded announcements.
 - Delete the last few announcements recorded.
 - Re-record the announcements deleted.

If the announcement file becomes corrupted, the only solution is to re-record all announcements. To do this, follow these steps:

- a. Remove the announcement board.
- b. Remove the tape cartridge from the tape drive. Do this so that announcements are not automatically restored from tape.
- c. Re-insert the announcement board.
- d. Re-record all announcements.
- e. Insert the tape cartridge in the tape drive.
- f. Issue the save announcements command to save all the announcements on the tape.

This hardware fault is fixed in the TN750B announcement board. However, the TN750B board will not automatically correct an announcement file which has previously been corrupted by a TN750 board. The only way to correct an announcement file corrupted by the TN750 board is to follow the steps above.

Announcement Administration

A brief description of the integrated announcement administration is given here to aid in troubleshooting the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to the following manuals:

1. *DEFINITY Communications System Generic 3 Implementation*, 555-230-653
2. *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500

3. *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511
4. *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations*, 555-230-701

Announcement Session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate Feature Access Code (FAC), administered as Announcement access code on the FACs form. Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted, or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press 2. To delete an announcement, press 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading Announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] with the administration terminal **save announcements** command. Likewise, integrated announcements can be downloaded to the Announcement circuit pack with the **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a tape cartridge to be in the system's tape drive (must not be write-protected) or a memory card (must not be write-protected). These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads and/or downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

1. An announcement is recorded within 10 minutes of circuit pack insertion.
2. An announcement download is invoked sooner with the administration terminal **restore announcements** command.
3. No announcement and/or NETCON data module is administered.
4. Either the announcement data module is busy or all the administered NETCON data modules are busy.

5. No tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] is in the system.
6. The tape or memory card in the system does not have a valid announcement file saved on it.

NOTE:

Unlike translations, there is no provision in the Generic 3 system for automatically saving announcements to the system tape or memory card.

Hardware Error Log Entries and Test to Clear Values

Table 10-39. Announcement Circuit Pack Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level (See WARNING below)	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test board PCSS sh r 1
1(a)	0	Circuit pack removed or SAKI Test (#53)	MINOR	ON	
2(p)		None			
14(b)	1 to 64	Announcement Checksum Test (#209)			
18	0	busyout board PCSS	WARNING	OFF	release board PCSS
23(c)	0	None	WARNING	OFF

	17699 (m)	In-line Error			
3840(n)	Any	None			
3999(o)	Any	None			

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

WARNING:

All alarms are upgraded to MAJOR when the BASE Tone Generator is set to 12. (France).

Notes:

- a. Error Type 1— The circuit pack totally stopped functioning or it was physically removed from the system.

 **NOTE:**

The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, follow the instructions for "Red (alarm)" in the "Control and Port Circuit Pack Status LEDs" section in Chapter 7, "LED Interpretation".

 **NOTE:**

The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

 **WARNING:**

Reseating and/or replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.

- b. Error Type 14—Whenever the Announcement Checksum Test (#209) fails, this error is logged. The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command. This error only appears in the Error Log in conjunction with Error Type 2817. Follow the procedures for Error Type 2817 to troubleshoot Error Type 14.
- c. Error Type 23—The circuit pack has been logically administered but not physically installed. The alarm is cleared when the circuit pack is installed.
- d. Error Type 125—A wrong circuit pack is inserted in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack and insert the logically administered circuit pack OR use the **change circuit-pack** command to readminister this slot to match the circuit pack inserted.
- e. Error Type 170—Announcement board is not allowed in slot A03 for a system with Enhanced SCC cabinet. The red led of announcement board is turned on and the error message "Announcement board is not allowed in slot A03" is shown on SAT when **test/busyout/release board A03** commands are entered. The announcement board must be removed and inserted into a different slot.
- f. Error Type 217 and 267— Indicate that there is more than one TN750 Announcement circuit pack inserted in the system. Remove the alarmed circuit pack.
- g. Error Type 257—This error indicates transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

- h. Error Type 513—This error, when reported with Aux Data in the range of 4352 to 4358, indicates the circuit pack has reported a hardware failure on the circuit pack. The circuit pack should be replaced.

WARNING:

Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.

- i. Error Type 1025—This error is not service-affecting and no action is required.
- j. Error Type 1281—The SP found a fault in the speech main memory (SMM) (that is, it found one or more faulty memory locations). Whenever this error is logged, error 2817 is also logged [see Note (k)], which causes the maintenance system to run the Announcement Checksum Test (#209) to determine if the bad memory location was being used by an announcement.
- k. Error Type 1538—The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:
 - 1. The tests run on the ports of this circuit pack are returning with a NO-BOARD.
 - 2. A busyout/release of the circuit pack has no effect on test results.
 - 3. A **list configuration** command shows that the circuit pack and ports are properly installed.

The system tries to restore the circuit pack within 15 minutes. If the error recurs after 15 minutes, replace the circuit pack. (Refer to Chapter 5, "Routine Maintenance Procedures".)

- l. Error Type 2049 and 2817—These errors are logged in conjunction with Error Type 1281, Aux Data 17699. Since that error [see Note (j)] means that a defective speech memory location was found, the announcement checksum error is also logged. This causes the Announcement Checksum Test (#209) to run, which determines if the defective memory location has corrupted any recorded announcements. If the Checksum Test passes, the faulty memory location is currently not being used, and the SP marks the location as faulty to ensure that future announcements do not attempt to use it.

NOTE:

As memory locations are marked faulty, the amount of available memory decreases, which decreases the total amount of announcement time available on the circuit pack.

- m. Error Type 2049—A transient error that does not cause an alarm can occasionally occur during a SPE, TDM BUS, or Tone Clock interchange. It is possible for a marginal Tone-Clock circuit pack to cause this error

against the ANN-BD without alarming the TONE-BD. If this error occurs again, replacing the Tone-Clock circuit pack may clear up this error. See the FAIL case in the Clock Match Inquiry Test (#212).

- n. Error Type 3840— This error is not service-affecting and no action is required.
- o. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.
- p. Error Type 2—Check the Class of Restriction (COR) administered for the Data Line extension assigned to the TN750 for uploading and downloading announcements. The extension can be found by using **list data-module**.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in [Table 10-40](#) when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-40. System Technician-Demanded Tests: ANN-BD

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
Control Channel Loop Around Test (#52) (a)		X		ND
Angel-Speech Processor (SP) Handshake Test (#208)		X		ND
Clock Match Inquiry (#212)	X	X		ND
Super Frame Match Inquiry (#211)	X	X		ND
140AY Loop Around Test (#210)	X	X		ND
Announcement Checksum Test (#209)	X	X		ND
Network Processor Element (NPE) Audit Test (#50) (a)		X		ND
SAKI Test (#53) (a)			X	D

¹ D = Destructive, ND = Non-destructive

Note:

- a. For a complete description of these tests, refer to the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation.

Angel-Speech Processor (SP) Handshake Test (#208)

This test checks the integrity of the communication link between the two processors on the Announcement circuit pack. Failure of this test indicates that the Speech Processor is insane and **results in the loss of all integrated announcements on the circuit pack.**

Table 10-41. TEST #208 Angel-Speech Processor (SP) Handshake Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Circuit pack cannot be used. Announcement speech memory is cleared when this test fails. Therefore, when the problem has been resolved, announcements must be rerecorded or downloaded to the circuit pack. Refer to "General Notes" near the beginning of this Maintenance documentation. 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, replace the circuit pack and then run this test again. 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works.  WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance documentation.</i>
	PASS	The communications link between the two processors on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

Announcement Checksum Test (#209)

Associated with every recorded announcement is a checksum. In this test, the SP checks a stored global checksum covering all recorded announcements against a calculated one and returns the results to the maintenance system. If the global checksum failed, maintenance requests the SP to check each individual announcement's checksum.

If the test fails, then it returns the total number of defective announcements found. In addition, associated with each failure is an error in the Error Log (Error Type 14). The Aux Data indicates the number of the first defective announcement

found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command.

Table 10-42. TEST #209 Announcement Checksum Test

Error Code	Test Result	Description/ Recommendation
0	ABORT	An error code of 0 indicates that the announcement file has been corrupted due to a hardware fault in the TN750 board. Follow step #7 under "General Notes" at the beginning of this section.
1023	ABORT	There are no announcements currently recorded on the circuit pack.
1024	ABORT	<p>This abort code is given for the following reasons:</p> <ol style="list-style-type: none"> 1. An announcement upload or download is in progress. 2. An announcement upload or download is requested when this test is running. 3. A record is in progress. 4. A record request comes in when this test is running. <p>If an announcement upload or download is in progress, a status data-module <announcement data extension> command should show that the announcement data port is connected to a NETCON data channel, and [for G3iV1.1-286] the tape drive should be active or [for G3sV2, G3iV2-386, or G3vsV2] the "card-in-use" amber LED for the memory card is on (to determine the extension of the announcement data module, use the list data-module command).</p> <p>See Note (a) at end of table for more information.</p> <ol style="list-style-type: none"> 1. Wait until the blocking event is finished, and then run this test again. An upload or download could take up to 45 minutes to complete, and a recording session is finished as soon as the station that was making the recording is placed on-hook. 2. If the test continues to abort, and a record or upload/download is not in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <p>Internal System Error.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-42. TEST #209 Announcement Checksum Test — Continued

Error Code	Test Result	Description/ Recommendation
0-256	FAIL	<p>Test failed. The error code indicates the total number of defective announcements that were found.</p> <p>When TEST #209 fails with error code 0, the Global Checksum failed on the board, but no individual Checksum failed.</p> <p> NOTE:</p> <p>Since the announcements are recorded digitally, it is possible for the Announcement Checksum Test to <i>fail</i> but still have all the announcements sound uncorrupted. When an individual announcement fails the Checksum Test, always listen to the announcement first before taking any action (an announcement can be played back by dialing the announcement extension associated with the announcement number). If the announcement sounds corrupted, then rerecord it or delete it.</p> <ol style="list-style-type: none"> 1. Look in the Error Log to determine the number of the first defective announcement. Play back the announcement. If the announcement sounds defective, rerecord it or delete it. If the error code was greater than one (indicating that there is more than one defective announcement), run this test again and repeat this step. 2. If after deleting and rerecording all defective announcements, the checksum test still fails, reset the circuit pack using the reset board PCSS command and run this test again. 3. If the test still continues to fail, reseal the circuit pack and restore all announcements with an appropriate time estimate (for example, 40 minutes.) Then rerecord the lost announcements (that is, those recorded since the last save operation) and run this test again. 4. If the test still continues to fail, replace the circuit pack, and run this test again. <p> WARNING:</p> <p><i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p>
	PASS	<p>All recorded announcements checksum correctly, indicating that the speech main memory is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement do not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yield the following abort codes:
 - Ports 1 AND 9 abort Test #206 with code 1024
 - Ports 1 AND 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

`Error encountered, can't complete request`

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

140AY Loop Around Test (#210)

This test checks the integrity of the record channel on the Announcement circuit pack (Announcement Port 1). The main function of the 140AY device is to accept Pulse Code Modulation (PCM)/Adaptive Differential Pulse Code Modulation (ADPCM) samples and compress/expand the samples using ADPCM. This test connects a Tone Generator to one port (Announcement Port 1, the recording port), and a Tone Detector to another port (Announcement Port 9). A tone is generated by the Tone Generator on the first port and looped through the 140AY device to the second port. The Tone Detector then responds with a tone present/absent message. The 140AY Loop Around Test is repeated at three different speech compression rates.

Since this test involves sending a tone through two different ports, the Playback Speech Memory Array (PSMA) Test (#206) [see ANN-PT (Announcement Port) Maintenance documentation for a description of this test] is run on the two ports first to make sure that they are working properly.

Table 10-43. TEST #210 140AY Loop Around Test

Error Code	Test Result	Description/ Recommendation
1-3	ABORT	Response to the test request was not received within the allowable time period. The error code indicates at which speech compression rate the test aborted (one being the first rate tested, three being the last). <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
10 90	ABORT ABORT	The PSMA Test (#206) failed on Announcement Port 1. The PSMA Test (#206) failed on Announcement Port 9. <ol style="list-style-type: none"> 1. Refer to "ANN-PT (Announcement Port)" Maintenance documentation, Test #206.
1000	ABORT	System resources required to run this test are not available. This test needs Announcement Ports 1 and 9 to run. One of the ports may be in use on a valid call. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and Ports 1 and 9 are not in use, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. <ol style="list-style-type: none"> 1. Look for TTR-LEV errors in the Error Log. If present, refer to the "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to the "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-43. TEST #210 140AY Loop Around Test — Continued

Error Code	Test Result	Description/ Recommendation
1007	ABORT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9. 3. If the Announcement Ports pass all their tests, escalate the problem.
1024	ABORT	Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, a status data-module <announcement data extension> command should show that the announcement data port is connected to a NETCON data channel, and [for G3iV1.1-286] the tape drive should be active or [for G3sV2, G3iV2-386, or G3vsV2] the "card-in-use" amber LED for the memory card should be on (to determine the extension of the announcement data module, use the list data-module command). See Note (a) at end of table for more information. <ol style="list-style-type: none"> 1. Wait until download is finished (can take up to 45 minutes), and then run the test again. 2. If the test continues to abort and there is no download in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this error type. <ol style="list-style-type: none"> 1. Retry the command at one minute intervals a maximum of 5 times.
2007	ABORT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9. 3. If the Announcement ports pass all their tests, escalate the problem.
2100	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
	ABORT	Internal System Error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-43. TEST #210 140AY Loop Around Test — Continued

Error Code	Test Result	Description/ Recommendation
1-3	FAIL	<p>Test failed. The error code indicates at which speech compression rate the test actually failed (one being the first rate tested, three being the last).</p> <ol style="list-style-type: none"> 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test still fails, replace the circuit pack (see Warning) and run this test again. 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p> WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p>
	PASS	<p>The record channel on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
 - Ports 1 AND 9 abort Test #206 with code 1024
 - Ports 1 AND 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024

3. The **save/restore announcements** command times out with:

Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

Super Frame Match Inquiry Test (#211)

The super frame is a means by which the SP synchronizes with the 140AY device on the Announcement circuit pack. If the super frame is not synchronized, the SP is not able to properly process record/playback requests. Both the SP and the hardware generate a super frame pulse. When these two pulses are out of synch, the SP sets a flag to indicate the mismatch. When this test is run, the state of this flag is returned.

Table 10-44. TEST #211 Super Frame Match Inquiry

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT ABORT	Could not allocate the necessary system resources to run this test. Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-44. TEST #211 Super Frame Match Inquiry — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	Test failed. Announcement playbacks should sound corrupted. <ol style="list-style-type: none"> 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p>⚠ WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p>
	PASS	The SP can properly process record/playback requests. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

Clock Match Inquiry Test (#212)

This test is supported to determine the state of the clock generation circuitry on the Announcement circuit pack. This circuitry is used for controlling various pieces of the hardware, like the 140AY device. It is also used to synchronize the Announcement circuit pack with the clock that is on the backplane.

Table 10-45. TEST #212 Clock Match Inquiry Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT ABORT	Could not allocate the necessary system resources to run this test. Internal System Error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-45. TEST #212 Clock Match Inquiry Test — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	<p>Test failed. Announcements recorded or played back while the clock circuitry is not functioning properly sound distorted. The ANN-BD may be defective or the Active Tone-Clock circuit pack (TONE-BD) in the same Port Network as the ANN-BD may be marginal and is causing this test to fail.</p> <ol style="list-style-type: none"> 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, proceed to Step 2 or 3 as applicable. 2. If this is a High or Critical Reliability system, determine the Active TONE-BD in this Port Network via the status system command and make the Standby Tone-Clock circuit pack active via the set tone-clock PCSS command. Rerun the test. If the test passes, then replace the now Standby Tone-Clock circuit pack. If the test continues to fail, replace the ANN-BD circuit pack. <p>⚠ WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p> <ol style="list-style-type: none"> 3. If this is a Standard system (that is, not a High or Critical Reliability system), replace the ANN-BD. Rerun the test. If the test continues to fail, replace the Tone-Clock circuit pack located in the same Port Network as the ANN-BD. <p>⚠ WARNING: <i>Replacing the Tone-Clock circuit pack causes a standard system PPN to perform a COLD 2 reset or an EPN to reset. See the "How to Replace a Tone-Clock Circuit Pack" section in the "TONE-BD (Tone-Clock Circuit Pack)" Maintenance documentation. Replacing the ANN-BD results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p> <ol style="list-style-type: none"> 4. If there are recurring alarms on this circuit pack caused by this test failing, replace the ANN-BD even if the previous steps were successful. <p>⚠ WARNING: <i>Replacing the TONE-BD causes a standard system PPN to perform a COLD 2 reset or an EPN to reset. Replacing the ANN-BD results in loss of integrated announcements. See the "General Notes" section near the beginning of this Maintenance procedure.</i></p>

Table 10-45. TEST #212 Clock Match Inquiry Test — Continued

Error Code	Test Result	Description/ Recommendation
	PASS	Announcement record/playbacks should have clear sound quality. User-reported troubles on this circuit pack should be investigated using other circuit packs and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

ANN-PT (Announcement Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ANN-PT	MINOR	test port PCSSpp l	Announcement Port
ANN-PT	WRN	test port PCSSpp l	Announcement Port

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN750 Announcement circuit pack is a service circuit pack that provides a customer with an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (that is, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (Port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the system tape. If there are any errors associated with Port 17, refer to "DAT-LINE (Data Line)" Maintenance documentation. If there are any errors associated with the circuit pack, refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack, and communicates with the switch via the control channel on the TDM Bus. The second processor, or SP, controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General Notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1. The Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always better to try to reset the circuit pack via the **reset board PCSS** command first and, if that does not work, then try to reseat it. **Announcements are preserved through a software reset, but they are lost when the circuit pack is resealed.**

2. **If a customer has announcements on the Announcement circuit pack that cannot be re-recorded easily, then announcements must be saved on the system tape to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

 **NOTE:**

Unlike translations, announcements are NEVER automatically saved to the system tape.

3. The administration terminal **save announcements** command replaces the announcement file on tape with the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command, thereby destroying a valid file on tape.
4. The terminal **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the system tape. Care must be taken not to mistakenly enter this command, thereby destroying valid speech memory (especially if the system tape does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be re-recorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the circuit pack.
6. If announcement speech memory is corrupted, **announcements should not be saved**, that is, if the Announcement Checksum Test (#209) fails or if the speech sounds corrupted on playback. This can ruin a good announcement file on tape and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on tape, then announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).
7. Although Announcement Port 5 and Data Line Circuit Port 17 on the Announcement circuit pack are logically two separate ports, they are physically the same port. Therefore, if one of the ports is in use, the other one will be busy. Also, if Announcement Port 5 is out-of-service, the Data Line Circuit Port is taken out-of-service. However, if the Data Line Circuit Port is out-of-service, the Announcement Port remains in-service.

Announcement Administration

A brief description of the integrated announcement administration is given here to aid in the troubleshooting of the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements

to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to the following manuals:

1. *DEFINITY Communications System Generic 3 Implementation*, 555-230-653
2. *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations*, 555-230-701
3. *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500
4. *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511

Announcement Session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate FAC (administered as Announcement access code on the FACs form). Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press station keypad digit 2. To delete an announcement, press station keypad digit 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading Announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the system tape with the administration terminal **save announcements** commands. Similarly, integrated announcements can be downloaded to the Announcement circuit pack with the administration terminal **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a tape cartridge to be in the system's tape drive (must not be write-protected). These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads/downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

1. An announcement is recorded within 10 minutes of circuit pack insertion.

2. An announcement download is invoked sooner with the administration terminal **restore announcements** command.
3. There is no announcement and/or NETCON data module administered.
4. Either the announcement data module is busy or all the administered NETCON data modules are busy.
5. There is no tape in the system.
6. The tape in the system does not have a valid announcement file saved on it.

NOTE:

Unlike translations, there is no provision in the system for automatically saving announcements to the system tape.

Hardware Error Log Entries and Test to Clear Values

Table 10-46. Announcement Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port PCSSpp sh r 1
1		Playback Speech Memory Array (PSMA) Test (#206)	MINOR	ON	test port PCSSpp sh r 3
18	0	The port was busied out	WARNING	OFF	release port PCSSpp
130 (a)		None	WARNING	ON	test port PCSSpp sh
257		Channel Administration Memory Array (CAMA) Test (#205)	MINOR	ON	test port PCSSpp l r 3
	17667	In-line error			
513		140AY Channel Sanity Inquiry Test (#222)	MINOR	ON	test port PCSSpp sh r 3
	17684	In-line error			
769 (b)		None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

- b. This error is logged and the port is alarmed when an alarm is raised on the Announcement circuit pack because of a faulty condition with a common circuit pack resource. Any one of the following alarmed errors on the Announcement circuit pack causes this error to be logged against the Announcement Port: 1793, 2049, 2305, 2561. Follow the ANN-BD (Announcement Circuit Pack) Maintenance documentation to resolve these alarms. When the corresponding circuit pack alarm is cleared, this alarm clears.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Channel Administration Memory Array (CAMA) Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Channel Administration Memory Array (CAMA) Test (#205)		X	ND
Playback Speech Memory Array (PSMA) Test (#206)	X	X	ND
140AY Channel Sanity Inquiry Test (#222)	X	X	ND

¹ D = Destructive; ND = Nondestructive

Channel Administration Memory Array (CAMA) Test (#205)

This test is a memory device that stores information used to control the 140AY device. The Angel asynchronously feeds the CAMA with the control information. During the CAMA test, the Angel writes patterns into the CAMA, reads them back, and verifies that they match. If the patterns do not match, the test fails. This test is run periodically by the switch maintenance and by the Announcement circuit pack in the background.

Table 10-47. TEST #205 Channel Administration Memory Array (CAMA) Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, and the circuit pack is not in use, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. See Note (a) at end of table for more information.
2100	ABORT ABORT	Could not allocate the necessary system resources to run this test. Internal System Error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Test failed. Announcements played back on this port may sound corrupted. <ol style="list-style-type: none"> 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p> WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.</i></p>
	PASS	This test verifies that the Angel processor can properly set up this port for playbacks. User-reported troubles on this circuit pack should be investigated using other port and circuit pack tests. (Refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests.)

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
 - Ports 1 AND 9 abort Test #206 with code 1024
 - Ports 1 AND 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

Playback Speech Memory Array (PSMA) Test (#206)

The PSMA test checks the integrity of a playback channel's interface to the speech memory and the TDM Bus. The SP has an internal buffer that contains a specific 256-byte sequence. During this test, the byte sequence is "played" through the 140AY device onto the TDM Bus. A General Purpose Tone Detector is used to confirm that the proper sequence was played. **This test is very important.** It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

Table 10-48. TEST #206 Playback Speech Memory Array (PSMA) Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the pack is not in use, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat the test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. <ol style="list-style-type: none"> 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
1024	ABORT	Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, a status data-module <announcement data extension> command should show that the announcement data port is connected to a NETCON data channel, and the tape drive should be active. (To determine the extension of the announcement data module, use the list data-module command.) <p>See Note (a) at end of table for more information.</p> <ol style="list-style-type: none"> 1. Wait until download is finished (could take a maximum of 45 minutes), and then run the test again. 2. If the test continues to abort and there is no download in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT ABORT	Could not allocate the necessary system resources to run this test. Internal System Error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-48. TEST #206 Playback Speech Memory Array (PSMA) Test — Continued

Error Code	Test Result	Description/ Recommendation
1 to 254	FAIL	<p>Test failed. The error code indicates the number of byte count errors found by the Tone Detector.</p> <ol style="list-style-type: none"> 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p> WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.</i></p>
255	FAIL	<p>Test failed. The Announcement Port and the Tone Detector never synchronized. Check for active GPTD-PT errors, and refer to "GPTD-PT [General Purpose Tone Detector Port (CPTR)]" Maintenance documentation to diagnose them first.</p> <ol style="list-style-type: none"> 1. If there are no active GPTD-PT errors, reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). <p> WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.</i></p>
	PASS	<p>This port can cleanly play announcements. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests.</p>

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore**

announcements will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
 - Ports 1 and 9 abort Test #206 with code 1024
 - Ports 1 and 9 abort Test #205 with code 2000
 - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

140AY Channel Sanity Inquiry Test (#222)

The Angel keeps a sanity status bit for each of the 16 channels on the 140AY device. This test queries the Angel to determine the status for a particular channel. If a channel is insane, that implies that announcements cannot be played back on that channel.

Table 10-49. TEST #222 140AY Channel Sanity Inquiry Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
	FAIL	Test failed. Announcements cannot be played back over this port. 1. Reset the circuit pack via the reset board PCSS command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning).  WARNING: <i>Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.</i>
	PASS	Announcements can be played back over this port. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to " ANN-BD (Announcement Circuit Pack) " for a description of the circuit pack tests.

ANNOUNCE (Announce)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ANNOUNCE	none	none	ANNOUNCEMENT

The ANNOUNCE MO logs an error in the hardware error log if at least one of the following is true:

- The **save announcements** or **restore announcements** command does not complete successfully, or the
- System fails to restore announcements from the memory card [386 system] or tape [286 system] at boot time.

Figure 10-4 shows the connection of the Announcement Circuit Pack to the system. To save or restore announcements, an ANNOUNCEMENT Data Extension must be administered, and at least one DATA-CHL (Network Control Data Channel) must be in the in-service/idle state.

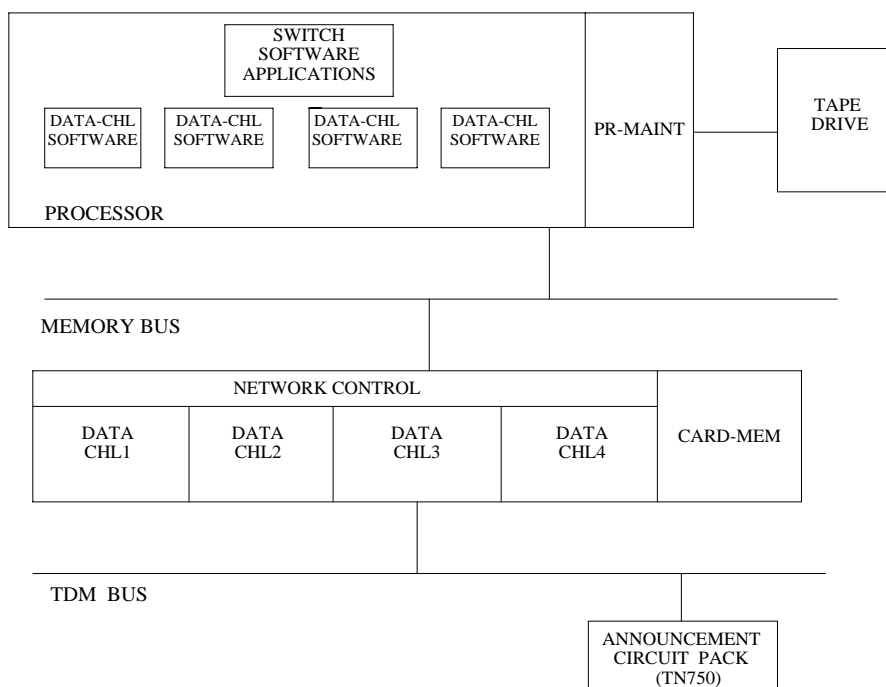

Figure 10-4. Connection of Announcement Circuit Pack to the System

Hardware Error Log Entries

ANNOUNCE Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1(a)(f)	any	None			
257(b)(f)	any	None			
513(c)(f)	0	None			
769(d)(f)	0	None			
1025(e)(f)	any	None			

Notes:

- a. Error occurred while saving announcements. (See Table 10-42 in the next section for an explanation of Aux Data and for recommended repair actions.)
- b. Error occurred while saving announcements to the standby SPE. (See Table 10-42 in the next section for an explanation of Aux Data and for recommended repair actions.)
- c. User pressed cancel while announcements were being saved by the active PE.
- d. User pressed cancel while announcements were being saved by the standby PE.
- e. Error occurred while restoring announcements. (See Table 10-42 in the next section for an explanation of Aux Data and for recommended repair actions.)
- f. The port field for this error contained the active PE complex when the error occurred.

Aux Data Error Codes and Recommended Repair Procedures

Table 10-50. Aux Data Error Codes and Recommended Repair Procedures

Aux Data	Description/ Recommendation
9000 through 9031	CARD-MEM [386 systems] errors. Check and resolve CARD-MEM [386 systems] errors and alarms.
30001 through 30054	Tape [286 systems] errors. Check and resolve TAPE [286 systems] errors and alarms.
32001	Internal system error. 1. Check other ANNOUNCE errors and take corrective action. If there are no other ANNOUNCE errors, do the following: 2. Retry the command at two minute intervals a maximum of three times. 3. If the save/restore announcements command fails, escalate the problem.
32002	Announcement circuit pack is in use. 1. Retry the command at two minute intervals a maximum of three times. 2. If the save/restore announcements command fails, escalate the problem.
32003	Announcement port is in use. 1. Wait for all Announcement ports to become available. 2. Enter the save/restore announcements command.
32004	There are no announcements recorded on the Announcement Circuit Pack. The save announcements command is not allowed to prevent the destroying of the announcement file on tape [286 systems] or on the memory card [386 systems].
32005	Integrated announcement circuit pack is not present. The Announcement Circuit Pack is not inserted, or it is defective. 1. Enter the list config command to check for the presence of the circuit pack in the system. 2. If the Announcement Circuit Pack is present, use the test board PCSS command to check the status of the Announcement Circuit Pack.
32006	Announcement Data Module not available. 1. Use the status command to check the status of the Announcement Data Module.

Table 10-50. Aux Data Error Codes and Recommended Repair Procedures — Continued

Aux Data	Description/ Recommendation
32007	Announcement Data Module out of service. 1. Use the status command to check the status of the Announcement Data Module.
32008	Announcement data is being saved or loaded. 1. Retry the command at two minute intervals a maximum of three times. 2. If the save/restore announcements command fails, escalate the problem.
32009	Required DATA-CHL is not administered or out of service. (A DATA-CHL is required to save or restore announcements.) 1. Add a DATA-CHL if none is administered. 2. If a DATA-CHL is administered, use the status command to check the status of all DATA-CHLs. At least one DATA-CHL should be in the in-service/idle state.
32010 32013	DATA-CHL is not administered, or it is unavailable. (A DATA-CHL is required to save or restore announcements.) 1. Add a DATA-CHL if none is administered. 2. If a DATA-CHL is administered, use the status command to check the status of all DATA-CHLs. At least one DATA-CHL should be in the in-service/idle state.
32012	Required Announcement Data Module is not administered. 1. Add an Announcement Data Module and repeat the command.
32014	Command timed out on the standby processor [286 systems]. This could present problems. 1. Check the error and alarm logs for errors and alarms that are logged against the STBY-SPE (Standby SPE) [286 systems].
32015	Time of day not set. 1. Set the time of day, and reenter the save/restore announcements command.
32016	Internal System errors. Check for any other ANNOUNCE errors and take corrective action.If there are no other announcements errors, do the following: 1. Retry the command at two minute intervals a maximum of three times. 2. If the save/restore announcements command fails, escalate the problem.

ASAI-BD (Multi-Application Platform Board)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ASAI-BD	MIN	test board PCSS sh	ASAI-BD
ASAI-BD	WRN	test board PCSS sh	ASAI-BD

¹ Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, or D); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., and so forth).

Maintenance testing of the common circuit pack is handled by on-board firmware and SPE-controlled tests. Maintenance software queries the firmware for error and alarm information, status, and test results. Firmware automatically reports error conditions that result in SPE-controlled testing.

For MAPD board insertion, the switch makes an additional board query if any of the following circuit packs are inserted:

Circuit Pack	Vintage
TN754	49
TN556	49, 80 or greater
TN800	any

For any of the above initial board uplinks, the switch queries the board for administration data, as well as reporting the switch software release and the system type.

For the native mode, the response to the board query downlink messages consists of several CCMS uplink messages that identify the true board code, vintage, suffix, emulation type, and number of reserved slots needed.

NOTE:

Refer to LAN-BD Maintenance documentation for circuit pack level errors. See also ASAI-PT/ASAI-EPT (BRI Line) maintenance documentation for related line information. See the following exceptions listed below:

- **Hyperactivity:** currently, the common circuit pack is considered “hyperactive” if the Service Dispatcher receives 200 uplink messages from the circuit pack in a 10-second period. Since MAPD has 32 ports, the hyperactivity limit increases to 500 uplink

messages per 10 seconds. The switch issues an alarm when the limit reaches 400; when it reaches 500 up-link messages in 10 seconds, the board is taken out of service.

- LED use: the LED Control Message 038x requests the Angel to drive the red, yellow, and green LEDs on the face plate of a typical port board on or off. On the MAPD, only the red LED is controlled by this message. Yellow and green change requests received from the switch by the MAPD drive LCD behavior rather than LED behavior. The DEFINITY switch continues to send the same LED control messages to the MAPD that the DEFINITY switch currently sends to all other port boards. The MAPD handles proper interpretation of these messages. You should note that the PC on the MAPD and the switch itself control the LEDs and the LCD on the MAPD.
- Port Administration: in Administration Without Hardware (AWOH), the switch allows administration of up to 8 ports in any of the first 12 ports. If the port type later reported by the board does not match the existing type, the switch assumes it to be a MAPD board with a different configuration and rejects the board.

 **NOTE:**

Refer to the LAN-BD documentation for circuit pack level errors. For related information, see ASAI-PT and ASAI-EPT maintenance documentation.

ASAI-EPT

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-EPT	MAJOR ¹	test station extension	ASAI-Adjunct

¹ The alarm level for ASAI adjuncts is administered using the **set options** command. The alarm level can be set independently for off-board and on-board alarms to WARNING, MINOR, or MAJOR for all ASAI adjuncts in the system.

The maintenance strategy for this endpoint MO is built on maintenance facilities offered in the Lucent ISDN-BRI protocol and in the ASAI adjuncts. Currently there are no facilities in the protocol that provide for maintenance of set data features.

The TN800 is a PC-based platform that allows interaction of multiple applications with DEFINITY at any time. DEFINITY Release 5 software (Native mode) supports emulation of three types of port MOs on this board. The type of ports to be emulated is defined by the applications running on the TN800.

⇒ NOTE:

If the TN800 is emulating BRI, the software/firmware supports a maximum of 12 ports, but only 8 of the 12 ports can be administered at any one time.

Error Log Entries and Test to Clear Values

Table 10-51. ASAI-EPT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level ASAI-EPT	On/ Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test ASAI-ADJ
2 (a)	2-102	None

Table 10-51. ASAI-EPT Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level ASAI-EPT	On/ Off Board	Test to Clear Value
2568 (i)	0	None			
3329 (j)	Any	Signaling Link Status (626)	MAJ/WNG [†]	OFF	
3584-3839 (k)	0, 1	None			
3841 (l) 4095	0	None			

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Major alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

- a. Errors of this type indicate violations of the ISDN-BRI signaling protocol. Timers associated with certain Layer 3 messages have expired before a required response was received. In the following table, the aux data column indicates which timer has just expired. For more information, refer to the Lucent ISDN-BRI Specification.

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (REStart timer)
12	T309 (Layer 2 Failure timer)
16	TM100 (Management Information Message timer 1)
17	TM200 (Management Information Message timer 2)
102	TASAI (ASAI Routing Timer)

The switch sent a message to an endpoint that did not respond in the allotted time. This may be due to failure of the point-to-point signaling link or because of a problem in the ASAI adjunct. To repair:

- Execute the **test station extension** command and perform the associated repair procedures for those tests.

- b. An endpoint is not responding to the service state query message sent to the adjunct or to the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or to the adjunct.

When this error occurs for an ASAI adjunct, the Aux Data field indicates the state of the ASAI link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to Layer 3 query
154	13-restarted	Invalid response to Layer 3 query
202	13-established	No response to Layer 3 query
204	13-established	Invalid response to Layer 3 query

See “status bri-port” in Chapter 8 for an explanation of the ASAI link states.

For ASAI or Lucent adjuncts, the switch queries the adjunct every two minutes. The Layer 3 Query Test is not executed for ASAI or Lucent adjuncts through a command issued from the management terminal. While alarmed for this error, the switch takes the associated port out-of-service for five seconds every 15 minutes. This action attempts to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Lucent adjunct, the service technician should:

1. Execute the **test station extension** command and perform the associated repair procedures for those tests.
 2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
- c. This error and associated warning alarm are logged against an ASAI endpoint when the adjunct has asked the switch to suspend maintenance on the ASAI endpoint. Busying out and releasing the ASAI station clears this alarm.
- d. This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.
- e. This error occurs when the signaling link associated with the ASAI endpoint has too much link-establishment related traffic. This occurs if the signaling link is alternating between assigned and established states. If this problem persists, replace the endpoint.

- f. This error occurs when the ASAI-EPT message is not transmitted because the PKT-CTRL (packet control circuit pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, re-engineering the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- g. The ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow-controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- h. This version of ASAI is not supported. Check the software version that is running on the ASAI adjunct.
- i. The adjunct identification is invalid. Check the vendor ID or software running on the ASAI adjunct.
- j. This occurs when the point-to-point signaling link to the endpoint goes down, except when the link goes down because either a system technician has busied out the PKT-CTRL or the PKT-BUS, or they have failed. This error raises an alarm against the endpoint or adjunct. Execute the **test station extension short** command and note the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is re-established to the endpoint or adjunct.
- k. The switch software logs certain ASAI cause values. The cause value is determined from the following formulas:
 - If the error type is greater than 3712, then the ASAI cause value is equal to the error type minus 3712. The switch sent this value to the adjunct.
 - If the error type is less than 3712, then the ASAI cause value is equal to the error type minus 3584. The switch sent this value to the adjunct.

Table 10-44 contains a description of the various ASAI cause values and recommended system technician actions associated with the cause value. The ISDN-BRI Specification (801-802-100) contains further information. In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

- l. The switch software logs certain ASAI cause values. The cause value is determined from the following formula:
 - If the error type is greater than 3968, then the ASAI cause value is equal to the error type minus 3968. The switch sent this value to the endpoint.

- If the error type is less than 3968, then the ASAI cause code is equal to the error type minus 3840. The switch sent this value to the endpoint.

Table 10-52. ASAI Cause Values

Code	Explanation	Recommendation
0	Unrecognized ASAI Protocol Operation.	Requested ASAI protocol is not implemented by switch or adjunct. Aux data field of error log entry contains protocol identifier for unrecognized operation. <ol style="list-style-type: none"> 1. Consult switch and adjunct documentation to determine which set of operations is supported by switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem.
34	No circuit or channel available	A resource on the switch is unavailable for a call. For BRI endpoints, this cause value is not logged. For ASAI, this condition means that there are no available trunks for an outgoing call request. <ol style="list-style-type: none"> 1. Verify that the adjunct is administered to support the trunk capabilities of the switch. 2. Investigate trunk group status by issuing the status trunk command from the SAT or by requesting trunk group query(ies) from the adjunct. 3. Perform trunk diagnostic procedures outlined in this manual.
40	Resources not available.	No available internal resources to service switch or adjunct request. Exceeds system transaction capacity for adjunct or switch. <ol style="list-style-type: none"> 1. May require re-engineering of adjunct services.
50	Requested facility not subscribed	Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. <p>For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Verify the switch administration of endpoint using either the display station or display data-module commands. 2. If Step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. <p>For ASAI adjuncts:</p> <ol style="list-style-type: none"> 1. Display the Customer Optional Features Form (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. 2. Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then readminister the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct.

Table 10-52. ASAI Cause Values — Continued

Code	Explanation	Recommendation
58	Bearer capability not presently available	Requested bearer capability is implemented, but not administered. No B-channel administered. See code 50 above.
63	Service or option not available	<p>Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resource. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct.</p> <ol style="list-style-type: none"> 1. Verify that no overlapping administration of switch resources (for example, requesting notifications on a single domain by multiple adjuncts attempting to control a single call) exists across all adjuncts connected to the switch. If overlaps exist, then re-administer the adjuncts to ensure that each adjunct is associated with a unique set of switch resources.
65	Bearer service not implemented	Requested service not implemented in switch or endpoint.
69	Requested facility not implemented	<p>Requested service not supported in switch or endpoint.</p> <ol style="list-style-type: none"> 1. Consult switch and endpoint documentation to determine service support.
79	Service or option not implemented	<p>Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct.</p> <ol style="list-style-type: none"> 1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Re-administration of the switch-administered capabilities (see Customer Optional Feature Form) or those of the adjunct may be necessary to correct the problem.
81	Invalid CRV	<p>An invalid CRV was sent by the adjunct.</p> <ol style="list-style-type: none"> 1. This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual.
87	Internal switch audit	<p>There is an inconsistency in switch data records.</p> <ol style="list-style-type: none"> 1. There is no action needed, since the switch has corrected the data inconsistency.

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When all circuit pack and port errors have been cleared, but errors still exist against the endpoint, investigate errors in the table below. By clearing error codes associated with the Signaling Link Status Test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Signaling Link Status Test (#626)	X	X	ND

¹ D = Destructive; ND = Nondestructive

BRI Layer 3 Query Test (#629)

This test is not used by the ASAI-ADJ maintenance object. For information about this test, see BRI-SET in the maintenance documentation.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is “bound” to an endpoint and fails if the link is “not bound.”

The definition of the term “bound” for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of “bound” for ASAI type of endpoint is:

- ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):

For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 (L2 established).

Table 10-53. TEST #626 Signaling Link Status Test

Error Code	Test Result	Description/ Recommendation
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the test port long PCSSpp command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.

Table 10-53. TEST #626 Signaling Link Status Test — Continued

Error Code	Test Result	Description/ Recommendation
1141	ABORT	The PKT-CTRL is out-of-service. 1. Refer to PKT-CTRL maintenance documentation.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. Execute the test port long PCSSpp command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1113	FAIL	The signaling link is not "bound" to the adjunct. For ASAI adjuncts this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified by administration, the link is only "unbound" from the endpoint when it is disconnected. 1. Execute the status bri-port PCSSpp command and refer to the associated procedures for this command contained in "BRI-PORT".
	PASS	The signaling link is connected at Layer 2 and "bound" to the ASAI adjunct.

ASAI-PT

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ASAI-PT	MAJOR ^{2,3}	test port PCSSpp I	ASAI ISDN BRI Port
ASAI-PT	WARNING	test port PCSSpp I	ASAI ISDN BRI Port

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, or D); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., and so forth).
- 2 The alarm level for ASAI adjunct ports may be administered using the **set options** command. The alarm level can be set independently for off-board and on-board alarms to WARNING, MINOR, or MAJOR for all ASAI adjunct ports in the system.
- 3 All alarming for an ASAI adjunct and off-board alarming for an ASAI port is disabled if the ASAI adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI adjunct. Check the Hardware Error and Alarm Logs to see if the adjunct has disabled alarming.

Unless otherwise stated, all maintenance actions contained in this section apply to ASAI-PT and ISDN-BRI ports connected to ASAI adjuncts. This port type is administered as an ASAI-BD on the TN800 circuit pack.

The TN800 circuit pack is a PC-based platform that allows interaction of multiple applications with DEFINITY at any time. DEFINITY software (Native mode) will support emulation of three types of port MOs on this board. The type of ports to be emulated are defined by the applications running on the TN800. The TN800 can support a maximum of 32 ports (time slots) at a time.

The TN800 connects to the switch through a single slot in the backplane, however its width is not limited to one slot. The number of slots occupied by the TN800 is supplied by the board during its insertion. The TN800 is 3 slots wide. The blank (reserve) slots are to the left of the functional slot.

In non-native mode the TN800 is recognized as TN556, TN2181, TN754, or TN746 based on the switch software and the application running on the TN800. In non-native mode only one type of port MOs will run at any time, and the port type depends on the application running on the TN800. If the TN800 fails diagnostics in non-native mode, the system's alarm and error logs would show a failure for the board type the TN800 is emulating.

Error Log Entries and Test to Clear Values

Table 10-54. ASAI-PT Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level ASAI-PORT	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port PCSSpp sh r 1
1 (a)	(a)	Level 1 Status Inquiry (#621)	MAJ ²	OFF	test port PCSSpp sh r 2
513 (b)	0	none	(b)	ON	
1537 (c)	46210	CRC Error Counter (#623)	MAJ ²	OFF	
3841 (d)	46208	None			
3844 (e)	46223	None			
3845 (f)		None			
3846 (g)	TEI	None			

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Major and Minor alarms may be downgraded to warning alarms based on the value used in the **set options** command.

Notes:

- a. This error occurs when the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The aux data field contains one of the following values:

Blank This indicates that the Level 1 Status Inquiry failed.

32773 This is a message from the ASAI-Line circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

- b. The circuit pack is having problems transmitting data to the Packet Bus, thus affecting the conveyance of signalling information over D-channel. This error occurs when the Packet Bus transmit FIFO buffer overflows. This condition probably indicates a hardware problem as well. The ASAI-PORT alarm level is MAJOR with aux data 0. Use troubleshooting procedures for both on-board hardware problems and potential off-board Packet Bus problems.

- c. The port received an invalid frame over the D-channel. When the Cyclical Redundancy Check (CRC) errors exceed 5 within 15 minutes, the port is taken out of service for 5 seconds. If 5 more CRC errors are received within 15 minutes of the first set of 5 errors, the port is taken out of service for one minute. If 5 more CRC errors are received within 15 minutes of the last 5, the port is taken out of service for 15 minutes.

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
 - If the problem persists, replace the endpoints or adjuncts.
- d. This error occurs when a Layer 1 Transmission error is detected for the port. Run the Long Test Sequence and note the results of the Layer 1 Transmission Error Counter Test (#624).
- e. This error occurs when the circuit pack detects an overflow of its receive buffers. Run the Long Test Sequence and note the results of the Receive FIFO Overflow Counter Test (#625).
- f. This error occurs when the BRI Port Local LAN Looparound Test (#618) fails. Run the Long Test Sequence and note the results of Test (#618).
- g. The Terminal Endpoint Identifier (TEI) administered for the ASAI endpoint most likely does not match the TEI administered in the ASAI adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. For example, by clearing error codes associated with the NPE Crosstalk Test, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND¹
ASAI Port Local LAN Looparound Test (#618)		X	D
Level 1 Status Inquiry Test (#621)	X	X	ND
CRC Error Counter Test (#623)		X	ND
Layer 1 Transmission Error Counter Test (#624)		X	ND
Receive FIFO Overflow Error Counter Test (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

¹ D = Destructive; ND = Nondestructive

BRI Port Local LAN Looparound Test (#618)

This test is destructive.

This test verifies the connectivity of a BRI port across the LAN Bus and executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the ASAI-PT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the ASAI-PT.

The dotted lines in Figure 10-5 show how a Looparound Test is performed across the Packet Bus for the D-channel.

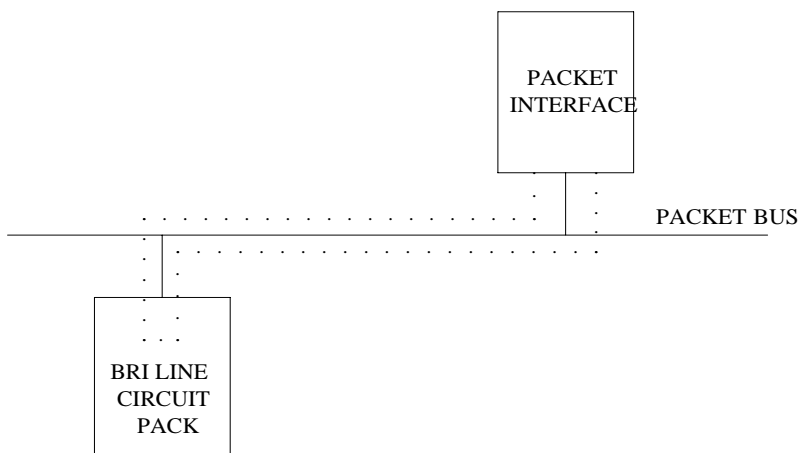

Figure 10-5. BRI Port Local LAN Looparound Path

Table 10-55. TEST #618 BRI Port Local LAN Looparound

Error Code	Test Result	Description/Recommendation
1015	ABORT	<p>The port is not in the out-of-service state.</p> <ol style="list-style-type: none"> 1. Display the Port Status form using the status bri-port PCSSpp command to determine which stations or adjuncts are on this port. 2. Use the extension shown on this form in the status station command to determine if the station or adjunct is in use. 3. If the port is in use, wait until it is idle, and use the busyout port PCSSpp command to place it in the out-of-service state and repeat this test. <p> WARNING: <i>Since the "busyout" command is destructive, using this command prior to the port being idle causes all transactions associated with the ASAI on the port to be torn down. Note that third party calls established by an ASAI adjunct remain connected even though the port is taken out-of-service.</i></p>
1139	ABORT	<p>The Packet Bus in the port network is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the test port long PCSSpp command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
1141	ABORT	<p>The PKT-CTRL is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the PKT-CTRL. 2. Issue the test port long PCSSpp command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
1144	ABORT	<p>The PPN Packet Bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the Packet Bus. 2. Issue the test port long PCSSpp command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
2012	ABORT	Internal system error
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-55. TEST #618 BRI Port Local LAN Looparound — Continued

Error Code	Test Result	Description/Recommendation
	FAIL	<p>The Looparound test has failed.</p> <ol style="list-style-type: none">1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are not in use. Reset the circuit pack by issuing the busyout board PCSS and the reset board PCSS commands.2. If the test fails again, execute test pkt P on the management terminal. If this fails, follow the failure procedures the in PKT-BUS section.3. If the tests executed in Step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	<p>The BRI Port Local LAN Looparound test has passed.</p>

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the Level 1 (L1) or physical layer. L1 can be in one of two possible states: Activated or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI adjunct administered on this port. This test passes if the state of L1 is activated. This test also passes if software has taken this port out of service.

The Deactivated state indicates a problem with the ASAI circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ASAI port is placed in the out-of-service state, Level 1 is also put into the deactivated state. This could be due either to the system detecting a fault with the port or in response to a **busyout port PCSSpp** request.

Table 10-56. TEST #621 Level 1 Status Inquiry

Error Code	Test Result	Description/Recommendation
1187	ABORT	<p>The board, port, or station may have been busied-out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (port busied out) for this port and ASAI-BD (board busied out). If this error type is present for ASAI-PT only, then release the port using the release port pp command and run the test again. If the error is present for both ASAI-BD and ASAI-PT, then release the board with the release port PCSS command and run the test again. <p>⇒ NOTE: When you release a port, you release all ports associated with it. If certain ports still need to be busied out, use the release port PCSSpp command to busy them out.</p> <ol style="list-style-type: none"> 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	<p>Response was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of 5 times, reset the circuit pack using the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
3	FAIL	<p>Received a status of Level 1 Deactivated; the port is out-of-service.</p> <ol style="list-style-type: none"> 1. Issue the status bri-port PCSSpp command to verify that the service state of the port is out-of-service. If the port is not out-of-service, proceed to Step 2. 2. If the port has been placed out-of-service using the busyout port PCSSpp command, try releasing the port by executing the release port PCSSpp command. Then issue the test port long PCSSpp command, and review the results of Level 1 Status Inquiry test. If this test is still failing, proceed to Step 3. 3. After executing the test port long PCSSpp command, review the results of all the tests. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing the test port PCSSpp command and by determining that the Level 1 Status test passes.
	PASS	<p>This test indicates that Level 1 is activated, or that software has taken the port out of service.</p>

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the ASAI circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY Communications System Generic 1 and Generic 3i Wiring*, 555-204-111). It does not indicate a problem with the TN800 circuit pack. This test is useful for verifying the repair of the problem

Table 10-57. TEST #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description/Recommendation
2000	ABORT	Response was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of 5 times, reset the circuit pack using the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, review the results of other tests in the Long Test Sequence. Note the results of the Level 1 Status Inquiry test. Follow the repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. 3. Replace the circuit pack.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Receive FIFO Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO error counter maintained on the TN800 circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from a Packet Bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port or if hardware fault is causing the receive buffers not to be emptied properly. This test is useful for verifying the repair of the problem.

Table 10-58. TEST #625 Receive FIFO Error Counter Test

Error Code	Test Result	Description/Recommendation
2000	ABORT	Response was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of 5 times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012 2100	ABORT ABORT	Internal system error Could not allocate necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, review the results of other tests in the Long Test Sequence. Note the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the tests that fail. Otherwise, go to the next step. 3. If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter Test continues to fail, check the wiring to the endpoints or adjunct.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Clear Error Counters Test (#270)

There are various error counters associated with each ASAI-PT. This test clears those counters and triggers the auditing of Layer 3 reinitialization. This test is used only to send messages to the ASAI-PT and, therefore, should neither abort nor fail. ASAI uses a fixed TEI value of 1.

Table 10-59. TEST #270 Clear Error Counters

Error Code	Test Result	Description/Recommendation
Any	ABORT	This test should never abort.
Any	FAIL	This test should never fail. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The message to clear the error counters of the ASAI-PT has been sent.

ASAI-RES/E-DIG-RES (TN800 reserve slot)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ASAI-RES	NONE	NONE	TN800 ASAI reserve slot
E-DIG-RES	NONE	NONE	TN800 DIG reserve slot

There are no tests associated with these MOs. Both the **test board** and **busy out board** commands abort when either is attempted on a reserved slot. An error message indicates the slot is associated with the circuit pack that the TN800 is emulating, but the requested operation is not valid.

The TN800 MAPD (Multi-Application Platform for DEFINITY) circuit pack connects to the switch through a single slot in the backplane. The number of slots occupied by the MAPD pack is supplied by the board when inserted. The TN800 in R5EM is 3 slots wide. The TN800 requires 2 reserve slots to its left. The reserve (blank) slots are to left of the functional slot and are place holders on the switch, and do not have any interaction with the switch.

Each instance of these MOs represents a reserve slot associated with respective circuit pack mode in which the MAPD is working.

ATM-BCH (ATM B-Channel Trunk)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ATM-BCH ²	MAJOR ³	test port UUCSSppp l	ATM B-Channel Trunk
ATM-BCH	MINOR	test port UUCSSppp l	ATM B-Channel Trunk
ATM-BCH	WARNING	test port UUCSSppp sh	ATM B-Channel Trunk

- 1 UU is the universal cabinet number (1 for PPN, 2-44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot where the circuit pack resides (01-21). ppp is the 3-digit port number (9-256).
- 2 For additional repair information, see also [“ATM-DCH \(ATM D-Channel Port\)”](#), [“ATM-SGRP \(ATM Signaling Group\)”](#) and PKT-BUS.
- 3 A MAJOR alarm on a trunk means that alarms on these trunks are not downgraded by the **set options** command, and at least 75% of the trunks in this trunk group are alarmed.

This maintenance object explains how you test and repair TN230x ATM Interface circuit packs (TN2305 and TN2306) that have ATM B-channel trunks administered for ATM Circuit Emulation Service (CES).

For maintenance instructions for TN230x circuit packs that are administered as Expansion Interfaces for ATM network connectivity, see the [“ATM-EI \(Expansion Interface Circuit Pack\)”](#) maintenance object.

ATM Circuit Emulation Service

Under ATM Circuit Emulation Service, you simulate ISDN-PRI circuits by assigning ATM ports to *signaling groups*. Each signaling group represents a PRI circuit, and the ports in the group represent the D-channel and B-channels of that circuit. B-channels must also be assigned to ISDN-PRI trunk groups. TN230x circuit packs support up to 248 ports per circuit pack.

Signaling group components

Bearer (B) channels (ATM-BCH) transmit digitized voice or data, while a separate D-channel (ATM-DCH) handles call-control signaling. One D-channel handles signaling for a group of B-channels that combine to form a signaling group (ATM-SGRP).

B-channel service states

The ISDN specification defines 2 service state categories for B-channels as listed in [Table 10-60](#).

Table 10-60. ATM ISDN service states

Category	Description		
Service states			
In-Service (INS)	B-channel is in normal operating state	Active	A call is connected over the B-channel.
		Idle	There is no call on the B-channel.
Out-of-Service/Far-end (OOS/FE)	<p>The switch has not successfully negotiated B-channel connection as of yet. Calls cannot be placed or received.</p> <p>When you first administer a B-channel, the switch initializes the B-channel to this state while it tries to negotiate a connection to the far end. If the request times out with no response from the far end, the switch leaves the B-channel in the OOS/FE state.</p>		
Out-of-Service/Near-End (OOS/NE)	The NPE Crosstalk Test has failed or the trunk is busied out. Calls cannot be placed or received.		
Maintenance/Far-End (MTC/FE)	A request has timed out with no response from the far end after signaling is in place and B-channels are in service. Calls can be received but not placed, and stable calls are unaffected.		
Maintenance/Near-End (MTC/NE)	The signaling channel (ISDN-LNK) has been busied out, possibly after a test trunk grp#/mbr# long command. Calls cannot be placed or received, but stable calls are unaffected.		
Pending states¹			
Pending-in-Service	The near-end is waiting for a response to a transition-to-service request.		
Pending-Maintenance	The near-end is waiting for a transition-to-maintenance-service request (US and other country-protocol-1 systems).		

¹ The switch is waiting for a reply from the far-end. Pending service states remain in effect until the near end receives a response or times out.

B-channel alarms

The Maintenance/Far-End and Out-Of-Service/Far-End states generate warning alarms displayed with **status trunk grp#/mbr#**.

Table 10-61. ATM-BCH alarms by service state

Service state	Alarm ¹	Possible cause	Possible solution
Out-of-Service/NE	Warning	Trunk busied out	Release the port (release trunk grp#mbr#).
	Minor	NPE Crosstalk Test (#6) failed	Replace ATM circuit pack.
	None	ATM circuit pack lost signal or there is a circuit pack problem.	Install circuit pack or cable. Check circuit pack using procedures in ATM-BCH. Check far-end switch status.
Out-of-Service/FE	Warning	Unadministered far-end	Administer the corresponding trunk on the far-end switch.
	Warning	Far-end busied out	Check the status of the far-end switch.
Pending/In-Service Pending/Maint	None	Maintenance message timed out waiting for reply	Wait 2 minutes after the pending state clears, and check the service state.
Maint/NE	None	ISDN test call in progress (test trunk long)	Wait for the test to finish and recheck.
	None	System link busied out	Check link status. Run release link link# .
Maint/FE	Warning	Signaling channel down for over 90 sec.	See ATM-SGRP or ATM-DCH.
	Warning	Repeated lack of response to messages sent to the far end	Wait. Maintenance software resends messages periodically. Or run test trunk grp#mb# or test signaling-grp grp# .
	Warning	The far-end trunk is being tested.	Check status of the far-end switch. Wait for testing to finish.
In-Service	None	Normal operating state	

¹ ATM-BCH alarms; alarms against other maintenance objects may also be present.

Error Log Entries and Test to Clear Values

Table 10-62. ATM-BCH Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port UUCSSppp
1(a)	Any	None			test port UUCSSppp
18	0	busyout trunk <i>grp/mbr</i>			release trunk <i>grp/mbr</i>
129 (b)		None	WNG	OFF	test port UUCSSppp
130 (c)					test port UUCSSppp
257(d)	Any	Service State Audit (Test #256)			test port UUCSSppp
513(e)	Any	None	WNG	OFF	test port UUCSSppp
769(f)	Any	Service State Audit (Test #256)			test port UUCSSppp
1793(g)	Any	None			test port UUCSSppp
3073(h)	Any	Service State Audit (#256)			test port UUCSSppp
3585(i)	Any	None			none
3841(j)	Any	None	WNG	OFF	none

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. Error Type 1: the two ends of the ATM trunk do not agree on the ISDN call state. Possible causes:
 - Received a DISConnect or RELease COMplete message with cause value 52 (outgoing calls barred)
 - Received a DISConnect or RELease COMplete message with cause value 54 (incoming calls barred)
 - Outgoing call renegotiated by the far end to another B-channel in the absence of SETUP message glare
 - Near end attempted a call on a B-channel that the far end has marked OOS

When running the Short Test Sequence, pay close attention to the results of the Call State Audit Test (#257).

- b. Error Type 129: the far-end switch changed its ISDN service state to either out-of-service or maintenance. This may be a temporary condition because the far-end is testing that trunk or a hardware problem with the trunk. Outgoing calls may not be allowed over that trunk.
 1. Investigate the trunk status (**status trunk grp#/mbr#**).
- c. Error Type 130: the circuit pack has been removed or has been insane for more than 11 minutes.
 1. Reinsert or replace the circuit pack to clear the error.
- d. Error Type 257: SETUP received for a B-channel that is in an invalid service state. Service states may be incompatible at the two ends of the trunk. A normal call was received while the B-channel was MTC/FE, MTC/NE, OOS/FE, or OOS/NE or a test call was received while the B-channel was OOS/FE or OOS/NE.
- e. Error Type 513: RELEase COMplete message received with cause value 82 (nonexistent channel). The B-channel may not be administered at the far end. The trunk has been placed in the OOS/FE state.
- f. Error Type 769: inconsistent SERvice or SERvice ACKnowledge message. Possible causes:
 - SERvice or SERvice ACKnowledge message received containing a change status that is more available than the previously-transmitted SERvice message.
 - Unsolicited SERvice ACKnowledge message received containing a change status that does not match the current B-channel state.

ISDN-PRI service-state negotiation rules have been violated and may indicate that a pending service-state audit is failing. The system

- cancels the maintenance timer
- increments the Service State Audit counter
- attempts a Service State Audit

When running the Short Test Sequence, pay close attention to the results of the Service State Audit Test (#256).

- g. Error Type 1793: TN230x circuit pack has failed. The maintenance system
 - places the trunk in the OOS/NE state
 - sends a SERvice message to the far-end (if possible) containing a change status of OOS for the B-channel
 - returns the trunk to service when the ATM trunk circuit pack reports the failure cleared
- h. Error Type 3073: Service State Audit attempt failed (see Test #256). Calls can be received but not placed until the test passes and the trunk state returns to In-Service.
 1. Check the trunk status (**status trunk grp#/mbr#**).

- i. Error Type 3585: ISDN RESTART message received. Active calls have been dropped.

The following Aux Data values (Error Type 3585 only) below represent the trunk's ISDN call state at the time Error 3585 occurred. This information can be useful if users report dropped calls on the ISDN-PRI trunks.

Aux Data	Description
0	An idle trunk received a restart.
10	An ISDN RESTART from the far-end has unexpectedly cleared a call in the ACTIVE state (call stable, parties talking).
4 7 8 260 263	An ISDN RESTART from the far-end has unexpectedly cleared a RINGING call.
1 3 6 9 265	An ISDN RESTART from the far-end has unexpectedly cleared a call before the call entered the RINGING state.
11 12 19 531 267 268	An ISDN RESTART from the far-end has unexpectedly cleared a call that was already in the process of clearing. If this condition occurs frequently, the far-end may be trying to clear trunks that appear to be in the "hung" state.

- j. Error Type 3841: the far-end rejected an ATM CES trunk selected by the near-end 10 times. The ATM CES trunk may not be administered on the far-end.
1. Get the physical name of the ATM trunk by noting the decimal number in the Aux Data field.
 2. Check administration for the named trunk on the far-end.
 3. If problems persist, then busyout the ATM trunk to take it out of the hunt group.

The WARNING alarm retires automatically whenever a called endpoint answers an outgoing or incoming call that uses the alarmed trunk.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate problems in the order presented in the table below. When you clear one of the error codes associated with a given test, you clear errors generated by other tests in the testing sequence. If you clear errors out of order, you can lose important information.

Table 10-63. System Technician-Demanded Tests: ATM-BCH

Order of Investigation	Short Test Sequence	Long Test Sequence	Destructive or Non-destructive
Signaling Link State Check Test (#255)	X	X	ND
Service State Audit Test (#256)	X	X	ND
Call State Audit Test (#257)	X	X	ND
ISDN Test Call Test (#258)		X	ND

Signaling Link State Audit Test (#255)

This non-destructive test checks the status of the TN230x ATM-CES Interface circuit pack and the ATM D-channel (ATM-DCH) trunk, which are both important elements to the health of the ATM-BCH trunk.

Table 10-64. TEST #255 Signaling Link State Audit Test

Error Code	Test Result	Description/ Recommendation
None	ABORT	Internal system error
0	ABORT	
1114	ABORT	Signaling link in transitional state 1. Retry the command up to 5 times at 1-minute intervals.
1018	ABORT	Maintenance disabled 1. Enable maintenance. Enter y in the <code>Maintenance Tests?</code> field on page 2 of the change trunk-group form.

Continued on next page

Table 10-64. TEST #255 Signaling Link State Audit Test — Continued

Error Code	Test Result	Description/ Recommendation
4	FAIL	Signaling channel problem 1. Look for errors or alarms against the " ATM-SGRP (ATM Signaling Group) " and " ATM-DCH (ATM D-Channel Port) " maintenance objects.
8	FAIL	TN230x circuit pack failed 1. See the " ATM-INTF (TN2305/6) " maintenance object.
	PASS	Signaling link OK.

Service State Audit (#256)

This test checks the service state of the trunk.

Country protocol 1. If the interface uses country protocol 1 (includes USA), the service-state audit executes in all trunk service states. It queries the service state on the far end and waits 2 minutes for a reply. If the first request times out, the service-state audit asks again. If the request times out again, it logs error 3073 and resends the request every 15 minutes. It places in-service trunks in the MAINTENANCE/FAR-END state (outgoing calls blocked, incoming calls accepted). Incoming calls trigger an immediate service-state audit without waiting for the end of a 15-minute cycle.

Any other country protocol. If the interface uses some other country protocol, the service-state audit executes only on trunks that are in the OUT-OF-SERVICE/FAR-END state. It asks the far-end switch to bring the trunk back into the IN-SERVICE state and waits 2 minutes for a reply. If the first request times out, the service-state audit asks again. If the request times out again, it leaves the trunk in the OUT-OF-SERVICE/FAR-END state and tries again in 1 hour.

⇒ NOTE:

PASS for this test only means that a message to the far-end was successfully sent.

To check the service state of the ATM-BCH trunk, run **status trunk grp#mbr#**.

Table 10-65. TEST #256 Service State Audit Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	Needed resources not available, port on a call or initializing 1. Run status trunk grp#mbr# . 1. Check the results of Test #255.
1018	ABORT	Maintenance disabled 1. Enable maintenance by entering y in the <code>Maintenance Tests?</code> field on page 2 of the change trunk-group form.
1113	ABORT	Signaling link failed 1. Run status trunk grp#mbr# . 2. Check the results of Test #255. 3. See the "ATM-SGRP (ATM Signaling Group)" maintenance object.
1114	ABORT	Signaling link in transitional state 1. Retry the command up to 5 times at 1-minute intervals.
1116	ABORT	Trunk not in Out-of-Service/Far-end state and country protocol other than 1
1117	ABORT	Service-state audit message outstanding 1. Wait 2 minutes, then try again.
2100	ABORT	Could not allocate needed resources 1. Retry the command up to 5 times at 1-minute intervals.
1113	FAIL	Signaling link failed 1. See the "ATM-SGRP (ATM Signaling Group)" and ISDN-LNK (ISDN Signaling Link Port) maintenance objects.
	FAIL	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
	PASS	1. Wait 4 minutes, then check the Error Log for any new Error Type 3073. <ul style="list-style-type: none"> ■ If there are none, both sides of the ISDN connection agree on the service state. The negotiation succeeded. ■ If there is a new 3073 error, then the negotiation failed (the request timed out).

Call State Audit Test (#257)

This test audits the internal call state by asking the far-end switch for the ISDN call state. The test is particularly useful when you are trying to clear a hung call. If the internal call state on the near-end differs from that on the far-end, the call is torn down.

The ISDN specification allows up to 2 minutes for a reply. If a reply is not received within the 2 minute window, the test logs a protocol time-out violation against the associated signaling channel (ATM-DCH, Error Type 1).

**NOTE:**

PASS simply means that an appropriate message was composed and sent to the far-end switch.

Table 10-66. TEST #257 Call State Audit Test

Error Code	Test Result	Description/ Recommendation
1018	ABORT	Maintenance disabled 1. Enable maintenance by entering y in the <i>Maintenance Tests?</i> field on page 2 of the change trunk-group form.
1019	ABORT	Audit already in progress 1. Wait 2 minutes, and try again.
1113	ABORT	Signaling link failed 1. Check the results of Test #255 (Signaling Link State Check).
1114	ABORT	Signaling link in transitional state 1. Retry the command up to 5 times at 1-minute intervals.
1116	ABORT	Trunk out-of-service 1. Check the trunk service state (status trunk grp#mbr#).
2100	ABORT	Could not allocate needed resources 1. Retry the command up to 5 times at 1-minute intervals.
	FAIL	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
	PASS	1. Wait 4 minutes, then check the Error Log for call-state mismatches. If a call state mismatch is found, the call is torn down.

ISDN Test Call Test (#258)

This non-destructive test performs a far-end looparound test over an ATM-BCH trunk if

- the trunk is IN-SERVICE, MAINTENANCE/NEAR-END, or OUT-OF-SERVICE/NEAR-END
- no calls are active on the trunk
- the system uses country protocol 1 (including US) or the far-end has looparound capability

The test sets up a call to a far-end switch over the ATM-BCH trunk. Then the digital port on a TN711D Maintenance/Test circuit pack sends a bit pattern to the far-end and back. If the received pattern matches that sent, the test passes. If there are differences, it fails.

Synchronous Test Calls

You can initiate a synchronous outgoing test call (including a test call for ISDN-PRI trunks) with these commands:

- **test trunk *grp#/mbr# long* [repeat #]**
- **test board *UUCSS long* [repeat #]**
- **test port *UUCSSpp long* [repeat #]**

Table 10-67. TEST #258 ISDN Test Call

Error Code	Test Result	Description/ Recommendation
4	ABORT	Signaling channel problem <ol style="list-style-type: none">1. Look for errors or alarms against the “ATM-SGRP (ATM Signaling Group)” and “ATM-DCH (ATM D-Channel Port)” maintenance objects.
8	ABORT	TN230x circuit-pack problem <ol style="list-style-type: none">1. See the “ATM-INTF (TN2305/6)” maintenance object.
1004	ABORT	B-channel in use. <ol style="list-style-type: none">1. See if a call is active. Run status trunk <i>grp#/mbr#</i> command.2. If the service state is In-Service/Idle, retry the test.
1005	ABORT	Bad configuration (for example, no Maintenance/Test circuit pack) <ol style="list-style-type: none">1. Make sure that the Maintenance/Test Circuit Pack is inserted.2. Repeat the test.
1018	ABORT	Test call disabled <ol style="list-style-type: none">1. Enable Maintenance on the Trunk Group form.

Table 10-67. TEST #258 ISDN Test Call — *Continued*

Error Code	Test Result	Description/ Recommendation
1020	ABORT	TN230x circuit-pack problem 1. See the “ATM-INTF (TN2305/6)” maintenance object.
1024	ABORT	Maintenance/Test Digital Port in use 1. Wait until yellow and green LEDs on the Maintenance/Test circuit pack are OFF. 2. Rerun the test. 3. If the problem persists, see the M/T-DIG (Maintenance/Test Digital Port) maintenance object.
1113	ABORT	Signaling link failed 1. Check the results of Test #255 (Signaling Link State Check Test).
1116	ABORT	Switch could not change the service state 1. See if calls are active. Run status trunk grp#/mbr# . 2. If a call is active. proceed as for Error Code 1119. 3. If not, check the Error and Alarm Logs and refer to the ATM-TRK (Circuit Emulation Service Circuit Pack) maintenance object.
1117	ABORT	ISDN service message outstanding 1. Wait 2 minutes. Then try again.
1118	ABORT	Far-end not administered 1. Check the administration of the far-end of the ATM trunk. Run status trunk grp#/mbr# . 2. Try the test again.
1119	ABORT	Test call aborted, normal call attempted 1. Wait for the call to terminate normally or drop it by running busyout trunk grp#/mbr# . 2. When the trunk is idle, retry the test.
1120	ABORT	Trunk OUT-OF-SERVICE/FAR-END 1. Try to change the service state via Test #256 (Service State Audit Test). 2. Try the test again.
1122	ABORT	No test-line number for the far-end switch 1. Check the Trunk Group Administration form.
1123	ABORT	No Feature Access Code administration for this Facility Test 1. Check the Dial Plan and Feature Administration forms.

Table 10-67. TEST #258 ISDN Test Call — Continued

Error Code	Test Result	Description/ Recommendation
2000 2012 None	ABORT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2035	ABORT	Call timed out 1. Wait 1 minute, and try again.
2036- 2037	ABORT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2038- 2039	ABORT	Problem reading test data 1. Wait 1 minute, and then try again. 2. If the test aborts again, there is a serious internal problem.
2040	ABORT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2041	ABORT	Call timed out 1. Wait 1 minute, and try again.
2066	ABORT	Could not establish test call 1. Retry the command up to 5 times at 1-minute intervals.
2067	ABORT	Call timed out 1. Wait 1 minute, and try again.
2074	ABORT	Bit and Block Error query failed 1. Retry the command up to 5 times at 1-minute intervals. 2. If the test continues to abort, there may be a serious internal problem in the Maintenance/Test Digital Port. See the M/T-DIG (Maintenance/Test Digital Port) maintenance object.
2075	ABORT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2201- 2205	ABORT	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
2206	ABORT	Could not allocate needed resources 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-67. TEST #258 ISDN Test Call — Continued

Error Code	Test Result	Description/ Recommendation
2208	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2209-2210	ABORT	Could not allocate needed resources 1. Follow recommendations for ABORT code 2100.
2211	ABORT	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2212	ABORT	Call terminated by unexpected disconnect 1. Wait 1 minute and then try again.
2213	ABORT	Call timed out 1. Wait 1 minute, and try again.
2214	ABORT	Call terminated by unexpected disconnect 1. Wait 1 minute and then try again.
2215-2219	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2220	ABORT	Call terminated prematurely 1. Wait 1 minute, and try again.
2221-2226	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2227	ABORT	Could not allocate needed resources 1. Retry the command at 1-minute intervals a maximum of 5 times.
2042	FAIL	Test data corrupt
	PASS	Test pattern intact. If the synchronous test call was performed (long test sequence), the communications path is operating properly.

ATM-DCH (ATM D-Channel Port)

MO Name (in Alarm Log)	Alarm Level	Initial System Technician Command to Run ¹	Full Name of MO
ATM-DCH ²	MINOR	test port <i>UUCSSpp l</i>	ATM D-Channel
ATM-DCH	WARNING	test port <i>UUCSSpp sh</i>	ATM D-Channel

- pp is administered as a port in the range of 9 through 32.
- For additional related information, see [“ATM-TRK \(Circuit Emulation Service Circuit Pack\)”](#).

NOTE:

TN230x circuit packs are not interchangeable. Always replace an ATM circuit pack with the same type.

This MO (ATM-DCH) utilizes the existing ISDN-PLK or D-channel maintenance strategy with modifications. The ATM circuit pack can be administered for up to 8 Circuit Emulation Service (CES) or signaling groups, each with its own D-channel, as opposed to one D-channel for an entire DS1 circuit pack.

NOTE:

Due to the dual personalities and the number of D channels the ATM board can possess, the in-line errors and signaling port LAN loopback test have been moved to the maintenance object ATM-TRK. When an in-line error is sent due to PACKET BUS errors, the ATM circuit pack maintenance object receives the error, not ATM-DCH.

The D-channel ISDN-PRI interface, which is emulated for ATM-CES, uses out-of-band signaling to transmit control messages between two endpoints. User information or bearer channels (B-channels) carry digitized voice and digital data and are assigned to DS1 ISDN trunks or PRI endpoints. Call control signaling for the B-channels is combined and carried over the separate ISDN-PRI Signaling Link Port D-channel.

Problems with ATM-DCH affects all of the associated B-channels, since call control signaling cannot reach the far-end switch or terminal adapter. Stable calls may remain operational, but no new calls can be made. ATM-DCH in turn depends on the TN230X ATM Trunk circuit pack it resides on and the packet bus which provides the link to the processor.

When working ATM-DCH alarms or errors, also investigate

- [“ATM-TRK \(Circuit Emulation Service Circuit Pack\)”](#)
- PKT-BUS

Hardware Error Log Entries and Test to Clear Values

Table 10-68. ATM D-channel Error Log entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test port UUCSSpp ²
18 (a)	0	busyout port <i>UUCSSpp</i>	WARNING	OFF	release port UUCSSpp
130 (b)		None	WARNING	ON	test port UUCSSpp
1793 (c)		Signaling Link Board Check (#643)			test board UUCSS I

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 pp is for ports 9-32.

Notes:

- a. Error Type 18: D-channel busied out; no calls possible over this D-channel.
- b. Error Type 130: circuit pack removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- c. Error Type 1793: ATM Trunk circuit pack failed the Signaling Link Board Check (#643). Resolve any ATM-TRK errors in the Error Log.

System Technician-Demanded Tests: Descriptions and Error Codes

The command to test the ATM-DCH maintenance object is **test port UUCSSpp**, where pp is for ports 9-32.

Table 10-69. System Technician-Demanded Tests: ATM-DCHL

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Signaling Link Board Check (#643)	X	X	ND

¹ D = Destructive, ND = Non-destructive

Signaling Link Board Check (#643)

This nondestructive test checks the health of the ATM TN230X Trunk circuit pack hardware. The test runs on a periodic or scheduled basis, during initialization testing, and upon demand.

NOTE:

The board-level maintenance is handled independently of the ATM-CES signaling link maintenance, raising the possibility of inconsistent states.

Table 10-70. TEST #643 Signaling Link Board Check

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error 1. Retry the command at 1-minute intervals for a maximum of 5 times.
8	FAIL	The TN230X circuit pack is not in-service. 1. Check the Error Log for ATM-TRK errors and resolve any using "ATM-TRK (Circuit Emulation Service Circuit Pack)" .
	PASS	The ATM TN230X circuit pack is in-service.

ATM-EI (Expansion Interface Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ATM-EI	MAJOR	test board UUCSS	ATM Expansion Interface Circuit Pack
ATM-EI	MINOR	test board UUCSS	ATM Expansion Interface Circuit Pack
ATM-EI	WARNING	test board UUCSS	ATM Expansion Interface Circuit Pack

- ¹ UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).

This maintenance object covers the ATM circuit pack administered as an ATM-Port Network Connectivity (PNC) Expansion Interface (ATM-EI). The ATM-EI provides PNC between a DEFINITY PPN and all the EPNs through the ATM switch.

The circuit packs listed in [Table 10-71](#) are ATM-EI boards *if they are administered to serve the ATM Port Network Connectivity (ATM-PNC) for DEFINITY.*

Table 10-71. ATM-EI circuit packs for R7 ATM-PNC

Circuit pack	Fiber	Echo cancellation	Release
TN2305	Multi mode	Y	7.1
TN2306	Single mode	Y	7.1
TN2238	Multi mode	N	6.3

⇒ NOTE:

TN230x circuit packs are not interchangeable. Always replace an ATM circuit pack with the same type.

⇒ NOTE:

ATM switch maintenance is not covered in this section. When DEFINITY ECS maintenance software suspects the ATM switch connections, it raises appropriate DEFINITY alarms.

To clear any ATM switch faults, refer to the particular ATM switch's documentation.

LEDs

The ATM-EI circuit pack has three LEDs:

- red indicates some alarm condition
- green indicates maintenance testing in progress
- yellow provides useful visual information regarding the operating mode of the ATM-EI and possible error conditions.

The possible LED states are in [Table 10-72](#).

Table 10-72. ATM-EI LED codes

LED	LED status	Condition
Red	Steady on	Board is not healthy
	Never on	Normal conditions
Red and Green	Red LED solid on Green LED 200 ms on; 200 ms off	Board is in the processes of booting
Green	Steady on ¹	Maintenance is running tests on the board
	100 ms on - 100 ms off	No links to the board
Yellow	100 ms on - 100 ms off	Fiber Loss of Signal (LOS), LOF, MS_RDI, MS_AIS, LCD, HP_RDI, HP_AIS, LOP, PSC (See Table 10-76)
Yellow	500 ms on; 500 ms off	Signal to the ATM switch is down
Yellow	2 s on; 0.2 s off	ATM-EI is Expansion Archangel (EAA)
Yellow	Steady on	ATM-EI active (PPN)
Yellow	Never on	ATM-EI standby

¹ The green LED flashes between tests.

ATM-EI-related commands

The following commands may be helpful in resolving ATM-EI problems:

add atm pnc	list measurements atm
busyout/release atm pnc	remove atm pnc
busyout/release board	reset board

10 Maintenance Object Repair Procedures

ATM-EI (Expansion Interface Circuit Pack)

10-176

change system-parameters customer-options (atm pnc)	status atm-pnc
change atm pnc (pnc duplication)	status cabinet
display atm pnc	status port-network
list atm oam-statistics	test board
list atm pnc	

Replacing an ATM-EI circuit pack

Standard Reliability

1. Enter **busyout atm-pnc** at the DEFINITY SAT.
2. Replace the ATM-PNC circuit pack.
3. Enter **release atm-pnc**.
4. Wait 2.5 minutes for board insertion (firmware download).
5. Enter **list sys-link** to verify that the links are up.
6. Enter **test board UUCSS** and verify that all tests pass.

High Reliability

There are 2 ATM-EI circuit packs in the PPN, 1 in the EPN.

1. Enter **busyout atm pnc** at the DEFINITY SAT.
2. Replace the circuit pack.
3. Enter **release atm pnc**.
4. Wait 2.5 minutes for board insertion (firmware download).
5. Enter **list sys-link** to verify that the links are up.
6. Enter **test board UUCSS** and verify that all tests pass.

Critical Reliability

There are 2 ATM-EI circuit packs in the PPN, 2 in the EPN.

1. Enter **status pnc** at the DEFINITY SAT. If the board is on the active side, enter **reset pnc interchange** to switch the active ATM-EI board to the standby side.
2. Enter **busyout pnc-standby**.
3. Enter **busyout atm-pnc a-pnc** or **b-pnc**.
4. Replace the circuit pack.

5. Enter **release atm pnc**.
6. Enter **release pnc-standby**.
7. Wait 2.5 minutes for board insertion (firmware download).
8. Enter **test board UUCSS** and verify that all tests pass.

Basic ATM PNC administration

NOTE:

This section contains basic administration information only. Refer to *DEFINITY ECS Installation, Upgrade, and Administration for ATM* for more detailed information.

ATM PNC connections involve administering

- 1 ATM-EI board in each Port Network (Standard Reliability)
- 2 ATM-EI boards in the PPN; 1 in each EPN (High Reliability)
- 2 ATM-EI boards in every Port Network; 1 in each EPN (Critical Reliability)

Adding ATM PNC connections

Standard Reliability

1. If the ATM PNC EI circuit pack is not present or if the circuit pack is present but is in an EPN, use the **change circuit-pack** command to add circuit pack translation.
2. Enter **add atm pnc n** (connection number), and administer the circuit pack location and ATM address.

Critical Reliability

1. Enter **change system-parameters duplication** and change the Enable Operation of PNC Duplication field to **n**.
2. If the ATM PNC EI circuit pack is not present or is present but it is in an EPN that does not yet have PNC connectivity to it, use the **change circuit-pack** command to add circuit pack translation for the missing circuit pack.
3. Enter **add atm pnc n** (connection number), and administer the circuit pack location and ATM address.
4. Enter **change system-parameters duplication** and change the Enable Operation of PNC Duplication field to **y**.

Removing ATM PNC connections

Standard Reliability

NOTE:

Standard Reliability systems are *not* equipped with PNC duplication.

1. Enter **busyout atm-pnc n** (connection number)
2. Enter **remove atm-pnc n** (connection number)

Critical Reliability

1. Enter **status pnc** and ensure that the A-PNC is active. If it is not active, request a PNC interchange using the **reset pnc interchange** command.
2. Enter **busyout pnc-standby**.
3. Enter **change system-parameters duplication** and change the Enable Operation of PNC Duplication field to **n**.
4. Enter **busyout atm-pnc n** (port network number).
5. Enter **remove atm pnc n** (port network number) to remove both ATM PNC EI boards, or enter **change atm pnc** to remove the B-side ATM PNC EI board.
6. Enter **change system-parameters duplication** and change the Enable Operation of PNC Duplication field to **y**.

Changing circuit pack location or ATM address

Standard Reliability

NOTE:

Standard Reliability systems are *not* equipped with PNC duplication.

1. Remove the ATM PNC connection (see [“Removing ATM PNC connections”](#) above).
2. Add an ATM PNC connection (see [“Adding ATM PNC connections”](#) above).

A-side ATM PNC EI — Critical Reliability

1. Remove the ATM PNC connection (see [“Removing ATM PNC connections”](#) above).
2. Add an ATM PNC connection (see [“Adding ATM PNC connections”](#) above).

B-side ATM PNC EI — Critical Reliability

1. Enter **status pnc** and ensure that the A-PNC is active.

If it is not active, request a pnc interchange using the **reset pnc interchange** command.

2. Enter **busyout pnc-standby**.
3. Enter **list config car** and verify that an ATM circuit pack is administered for the new location. If it is not, add the ATM circuit pack translations.
4. Enter **busyout atm pnc n** (connection number) **b-pnc**.
5. Enter **change atm pnc n** (connection number) and change circuit pack location for the B side.
6. Enter **release pnc-standby**.

Changing ATM address of a B-side ATM-PNC EI — Critical Reliability

1. Enter **busy pnc-standby**.
2. Enter **change atm pnc n** (connection number) and change the ATM address for the B side.
3. Enter **release pnc-standby**.

Error Log Entries and Test to Clear Values

Table 10-73. ATM-EI Error Log Entries

3842 (v)					
3999 (w)	Any	None			

- 1 Aux Data 32767 for any error log entry indicates that an alarmed ATM-EI was busied out and then released. When this occurs, existing service-affecting alarms must be preserved. Typically, all alarms are resolved when the ATM-EI is released. Therefore, the Alarm and Error Logs must be repopulated with the alarms present at time of busyout. This Error Code indicates that existing Aux Data and Error Log time stamps are no longer valid because they were lost when the circuit pack was released.
- 2 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 3 Test # 1258 applies to TN2238; Test #1293 applies to TN2305 and TN2306.

Notes:

- a. Error Type 2: on-board DUART chip failed. This results in communication failure between the port network's maintenance board and the ATM-EI board. The Maintenance circuit pack should have a red LED lit, because the link to the ATM-EI is down in this EPN.
 1. Reset the board with the **reset board UUCSS** command.
 2. If the board does not recover, replace the board.
- b. Error Type 18: the ATM-EI circuit pack has been busied out.
 1. Release the circuit pack (**release board UUCSS**).
- c. Error Type 23: an ATM-EI circuit pack has been administered with the **add atm-pnc n** command, but the circuit pack has not been inserted into the system.
 1. Insert an ATM-EI circuit pack at this location.
- d. Error Type 125: a wrong circuit pack is located in the slot where the ATM-EI circuit pack is logically administered.
 1. Either remove the wrong circuit pack and insert the ATM-EI circuit pack or remove the ATM-EI administration (see ["Basic ATM PNC administration"](#)).
 2. Remove the ATM-INTF administration and re-administer the slot (**change circuit-pack**) to match the circuit-pack that is physically present in this slot.
- e. Error Type 131: an ATM-EI circuit pack has been removed from the slot for 5 minutes.
 1. Insert the ATM-EI circuit pack into its administered slot.
 2. Another way to resolve or prevent this alarm is to remove the ATM-EI administration (see ["Basic ATM PNC administration"](#)), then remove the ATM-INTF administration (**change circuit-pack**).

It is possible that the ATM-EI could be held in reset by the EPN Maintenance board and is not inserted in the system.

 1. Try issuing the **test maint P long** command on the maintenance board in the same port network.
- f. Error Type 257: Expansion Interface Control Channel Test #316 failed (board cannot communicate on the TDM bus control channel). Follow the suggested test procedures.

Error Type 258: The archangel is out of sequence (Aux Data indicates angel number).

Error type 259: the expansion archangel link (EAL) to the active ATM-EI board is down. See SYS-LINK.
- g. Error Type 513: NPE Crosstalk test failed. The board is either writing to or reading from a TDM time slot that is not allocated to the board.

1. Test the board (**test board UUCSS**) and follow the test procedures suggested for this test. In random tests of a single DSP during low or high traffic, the same DSP may be tested more than once.
- h. Error Type 769 and 770 (Error Type 771 below): board-degraded alarm errors that result when the ATM switch is sending corrupted cells or excessive AAL/LAPD retransmissions (off-board ATM cell corruption errors). These errors indicate the detection of a problem in handling ATM cells that are received from the fiber interface.

Aux Data:

Error Type	Aux Data	Description
769	34	AAL5 Excessive: retransmission requests
769	35	LAPD Excessive: retransmission requests
770	25	ATM Uncorrectable cell headers - threshold
771	26	VPI,VCI pair unknown

The problem is most likely *not* on the ATM-EI circuit pack reporting the errors, but it could be due to one or more of the following reasons:

- The fiber is not snugly connected to either the board or the ATM switch.
- The PN packet bus is corrupting the cells. See Packet maintenance objects (Aux Data 35 only).
- The fiber between the ATM switch and the ATM-EI is too long (greater than 2km for multimode fiber). Use loopback to see if the fiber is corrupting the cells.
- Some other ATM-EI board is not receiving the cells properly.
- The intervening ATM switch is dropping the ATM cells due to a shortage of bandwidth, or the DEFINITY is using more than the subscribed bandwidth.

Error Type 771: the ATM switch is sending cells with unknown VPI and VCI address (wrong connection).

1. Ensure that the ATM-EI board address on the ATM switch matches the ATM-EI (ATM) address on the DEFINITY side.
- i. Error Type 1024-1151: These errors represent problems detected by the ATM-EI board in response to SETUP and ADDPARTY requests from software.
- The Error Types and descriptions are in [Table 10-74](#):
 - Aux Data values represent port network and angel numbers and are in [Table 10-75](#).

Table 10-74. ATM Error Types 1024 - 1151

Error Type	Description	General problem
1024	Next node unreachable	ATM protocol stack on ATM-EI circuit pack
1056	DTL Transit not my node ID	
1088	ATM-EI circuit pack received a request with an invalid connection identifier.	Firmware-detected problems on the ATM-EI circuit pack
1089	ATM-EI circuit pack received a request with a reference to an unknown VC token.	
1090	ATM-EI circuit pack did not have enough resources (memory) for the requested operation.	
1091	Internal failure in the local protocol stack. This can occur when the connection to the ATM switch failed, perhaps because the: <ul style="list-style-type: none"> ■ ATM switch rebooted ■ fiber between the ATM switch and the ATM-EI circuit pack disconnected 	
1092	ATM-EI circuit pack received a request for which the referenced VC was in the wrong call state.	
1093	ATM-EI circuit pack received a request for which the VPI/VCI pair was invalid or out of range.	
1094	ATM-EI circuit pack received a request to add a party to an existing VC. The add party request failed, and a retry was not possible.	
1095	ATM-EI circuit pack in link recovery after the lower ATM layer (Q.SAAL portion of the protocol stack) failed. This can occur when the connection to the ATM switch failed, perhaps because the: <ul style="list-style-type: none"> ■ ATM switch rebooted ■ fiber between the ATM switch and the ATM-EI circuit pack disconnected 	
1096	ATM-EI circuit pack received an error from the local protocol stack for which no more detailed cause was specified.	
1102	ATM-EI circuit pack asked to create more connections that it was capable of creating.	
1103	ATM-EI circuit pack detected an illegal message from software. <ol style="list-style-type: none"> 1. Check the Error Log for CONN-M proc errors for more information. 	
1113	Far-end circuit pack detected a problem of some kind. Further details not available.	Problems detected by the board terminating the connection

1. Test the ATM-EI circuit pack (**test board UUCSS**) and investigate further based on each test's results. If all tests pass, the error was a transient problem.

Aux Data values: For each connection request failure type, the port network and the angel number of the destination ATM-EI circuit pack are logged Aux Data values in the form XXYYY, where

- port network number = XX
- angel number = YYY

Since you need to know the slot number also, [Table 10-75](#) converts the Aux Data to slot numbers.

Table 10-75. Error Type 1024-1151 Aux Data values (XXYYY) converted to slot number

- j. Error type 1153: the ATM connection audit found some discrepancy in the firmware's VC token numbers and live VCs. The problem is rectified in firmware and no action is needed.
- k. Error Type 1281: loss of high-level signal indicating operational problems of equipment located outside of the circuit pack and the fiber connected to the board. Aux Data values are listed in [Table 10-76](#).

Table 10-76. Error type 1281 Aux Data and repair procedures

Aux Data	Alarm Description	Repair procedure
15	SYSCLOCK failed	The board is not locked to the TDM backplane clock signal. This is probably due to a Tone Clock problem. <ol style="list-style-type: none"> 1. Check for TDM-BUS or TONE-BD errors in the Error Log. 2. If no other problems are present, reset the circuit pack (reset board UUCSS)
16	Loss of Signal: LOS	The fiber is not connected properly to the ATM-TRK board or ATM switch (or to the multiplexer section [MUX] if present). It is possible that the board transceivers are not functioning properly. <ol style="list-style-type: none"> 1. Run test board UUCSS command. 2. If Test #1259 fails, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the yellow LED flash goes away. If it does the problem is off-board. 3. If the yellow LED continues to flash, replace the circuit pack.
17	Loss of Frame: LOF	The fiber signal cannot obtain or maintain STM-1/OC-3 framing. <ol style="list-style-type: none"> 1. Try to move the fiber on the ATM switch side to a different port. 2. If the problem persists, reset the circuit pack (reset board UUCSS).

Table 10-76. Error type 1281 Aux Data and repair procedures — *Continued*

Aux Data	Alarm Description	Repair procedure
22	High-level Path Alarm Indication Signal: HP_AIS	The payload is invalid. <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. 2. Run test board UUCSS. 3. If Test #1259 fails with Error Code 22, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the yellow LED flash goes away. 4. If it does the problem is off-board. 5. If the yellow LED continues to flash, replace the circuit pack.
23	High-level path Remote defect Indicator: HP_RDI	The far-end is detecting a major problem with the signal that this board is transmitting. The transmitted payload is invalid. <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. 2. Run test board UUCSS command; if the Test #1259 fails with Error Code 23, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the yellow LED flash goes away. 3. If it does the problem is off-board. 4. If the yellow LED continues to flash, replace the circuit pack.
24	Loss of cell delineation (LCD)	On board ATM framer chip is not able to frame cells based on the cell header. <ol style="list-style-type: none"> 1. Reset the board (reset board UUCSS). 2. If the error persists, replace the board.
27	SIGCON_DOWN ATM switch high level signal.	The board cannot communicate with the ATM switch. <ol style="list-style-type: none"> 1. Busyout the board (busyout board UUCSS). 2. Test the board (test board long UUCSS). 3. If Test #1260 fails, replace the board. 4. If Test #1260 passes, make sure the ATM address on both the DEFINITY and the ATM switch sides are the same for this board. 5. If the address is the same, change the port on the ATM switch side. 6. If the error is resolved, the problem is on the ATM switch port.

- l. Error Type 1537: LAN bus time out. The circuit pack is transmitting a packet larger than 1,024 bytes. Replace the circuit pack.
- m. Error Type 1538: A hyperactive ATM-EI circuit pack is generating an abnormal amount of control messages to the processor. When this error is generated, the system automatically resets the ATM-EI.

Duplicated PNC?	Then:
Y	service to the EPN is disrupted
N	the system switches to the standby PNC

- 1. Enter the **reset board UUCSS** command for this ATM-EI circuit pack.
- 2. If the same error persists, replace the ATM-EI circuit pack.
- n. Error Type 1793: LANHO transmit FIFO overflow error (the transmit FIFO RAM buffers on the circuit pack overflowed). This most likely indicates a hardware problem on the circuit pack, because the speed of the LAN/Package Bus is much higher than the speed of the link connected to the port.
 - 1. Test this ATM-EI circuit pack (**test board UUCSS**).
 - 2. If Test #598 fails again, replace the ATM-EI circuit pack.
- o. Error Type 2049, 2050: the ATM-EI is out of lock with the backplane system clock.
 - 1. Test this ATM-EI circuit pack (**test board UUCSS**).
 - 2. If Test #304 fails, follow the repair procedures suggested for this test.
- p. Error Type 2305: too many parity errors on data received from the LAN/Package Bus (could be due to packet bus problems).
 - 1. Test the ATM-EI circuit pack (**test board UUCSS**).
 - 2. If Test #598 fails, follow the repair procedures suggested for this test.
 - 3. If the test passes, look for and resolve any PKT-BUS (Packet Bus) alarms/errors.
 - 4. If there are no PKT-BUS errors and the problem persists, escalate the problem.
- Error Type 2309: packet interface chip (LANHO) malfunctioning.
 - 1. Test the ATM-EI circuit pack (**test board UUCSS**).
 - 2. If Test #598 fails, follow the repair procedures suggested for this test.

- q. Error Type 2561: ATM-EI 2-way Transmission Failure (circuit pack is having problems creating connections to other port networks in the system).
 - 1. Test the ATM-EI circuit pack (**test board UUCSS**).
 - 2. Follow the repair procedures suggested for Test #241.
- r. Error Type 2817, 2818: DSP test failure detected along the circuit path of the ATM-EI circuit pack.

Error Type	Description	Aux Data indicates
2817	DSP test failure	The Aux Data field contains the following information about the failed DSPs: <ul style="list-style-type: none"> ■ X is the number of talker DSPs ■ Y is the number of listener DSPs ■ Z is the number of echo-cancelling DSPs
2818	One or more DSPs failed	DSP number that has failed

- 1. Test the ATM-EI circuit pack (**test board UUCSS**).
 - 2. Follow the repair procedures suggested for Test #1258.
- s. Error Type 3329: on-board LANHO chip is insane, possibly due to a problem in Packet Bus arbitration, the transmission line frame, or the circuit pack itself. The circuit pack cannot talk to the packet bus.

If the packet bus is alarmed:

- 1. Resolve PKT-BUS errors, if any. The probability of this error being related to Packet bus problem increases with the number of other circuit packs using the Packet bus that are also displaying this error.

If the Packet Bus is *not* alarmed:

- 1. Reset the circuit pack (**reset board UUCSS**).
- 2. If the problem persists, replace the ATM-EI circuit pack.

If the system has a duplicated PNC, and the in-line error received is from an active ATM-EI, the system switches to the standby PNC.

CAUTION:

If the system does not have duplicated PNC, services to the EPN could be disrupted.

- t. Error Type 3585, 3586 (Major board alarm): failure of critical components involved in the operation of the circuit pack, and the switch may no longer recognize the circuit pack. If the system has a duplicated PNC and the in-line error received is from an active ATM-EI, the system switches to standby PNC.

**CAUTION:**

If the system does not have duplicated PNC, services to the EPN could be disrupted.

Error Type 3585:

Aux Data (Error Type 3585 only):

Aux Data	Description
1	ATM framer failure
2	NCE failed (only from ATM-EIs in EPN)
4	TDM_PLD_FAILED
5	DSP_ALL FAILED
6	Receive Network Processor (RNP) failure
7	Transmit Network Processor (TNP) failure
8	MEMORY read/write failure

1. If the board is in a PPN, or if the system has duplicated PNC:
 - a. Test the ATM-EI (**test board UUCSS I**).
 - b. If Error 3585 is detected again, or if the board is not recognized anymore, replace the ATM-EI circuit pack.
2. If the system does *not* have duplicated PNC, and the circuit pack is in an EPN:
 - a. Replace the ATM-EI circuit pack.

Error Type 3586: Framer Looparound Test #1260 failed.

Aux Data (Error Code 3586 only):

Aux Data	Description
2	Packet path failed
3	Circuit path failed
4	TDM loop cannot be created
5	Packet loop cannot be created

1. If Error Type 3586 is detected again, replace the circuit pack.
- u. Error Type 3841: the board received a message from the switch that it does not recognize, and the board responded with an inconsistent down link error message. This error does not affect service, and no action is required.
 - v. Error type 3842: the circuit pack received data from the Packet Bus faster than it could distribute the data to its endpoint. This circuit pack should be able to recover by itself, and no action is necessary.
 - w. Error Type 3999: circuit pack sent a large number of control channel messages to the switch within a short period of time.

If	Then
Error Type 1538 is also present	Circuit pack is taken out of service
If Error Type 1538 is not present	Circuit pack is <i>not</i> taken out of service, but has generated 50% of the messages necessary to be considered hyperactive. <ul style="list-style-type: none"> ■ This may be normal during heavy traffic. ■ If the error is logged during light traffic, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in [Table 10-77](#) when inspecting the errors in the system. By clearing error codes associated with the Control Channel Test, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-77. System Technician-Demanded Tests: ATM-EI

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
ATM Board DSP Test (#1258) for TN2238 circuit packs	X	X		ND
Expansion Interface 2way-Transmission Test (#241)	X	X		ND
ATM Board Frammer Looparound Test (#1260)		X		D
NPE Cross Talk-Test (#6) for TN2238 circuit packs		X		ND
Expansion Interface Lock Query Test (#304)	X	X		ND
ATM Board Error Query Test (#1259)	X	X		ND
ATM Expansion Interface Reset (#1256)			X	D
ATM board DSP test(#1293) for TN2305 and TN2306 circuit packs.	X	X		ND
ATM Cross Talk test(#1298) for TN2305 and TN2306 circuit packs		X		ND

¹ D = Destructive, ND = Non-destructive

⇒ NOTE:

To get a better indication of a problem's location, test both ATM-EI circuit packs on the associated fiber link, whether the circuit packs are both ATM-EI circuit packs or not.

NPE Cross Talk Test (#6) (TN2238 only)

This test is non-destructive. The NPE Cross Talk test verifies that the selected TDM bus time slot never crosses over to time slots reserved for other connections. The test also checks for cross connections, where the board talks/listens to time slots other than those specified. Since this test uses many system resources (TDM time slots, tone generator, tone detector, and others), it runs as a part of a demand test only.

This test fails if either the TDM programmable logic and/or the interface to the DSP is not operating properly. Failure of these components may result in one-way or noisy connections. Refer to [Figure 10-6](#) for a schematic of this test.

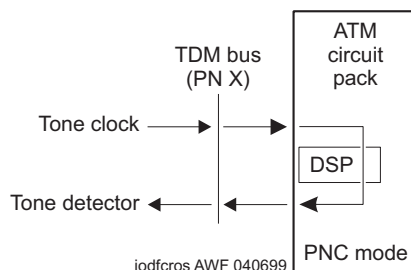

Figure 10-6. NPE Cross Talk Test #6 schematic

Table 10-78. NPE Crosstalk Test (#6)

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2	ABORT	All DSPs are busy (an unlikely event) 1. Retry the command at 1-minute intervals for a maximum of 3 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-Bus errors. 1. If system has no TDM-Bus errors and is not handling heavy traffic, repeat test at 1-minute intervals for a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals for a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2752	ABORT	The circuit pack in this location is not an ATM pack.

Continued on next page

Table 10-78. NPE Crosstalk Test (#6) — Continued

Error Code	Test Result	Description/ Recommendation
1	FAIL	One (or more) DSP on the circuit pack is defective. Because of the above condition maintenance software could not allocate a DSP for this test: <ol style="list-style-type: none"> 1. Test the circuit pack (test board UUCSS) and see if the DSP Test #1258 passes. 2. If the DSP Test #1258 fails, replace the circuit pack. 3. If the DSP Test #1258 passes, retry the command at 1-minute intervals a maximum of 3 times.
6	FAIL	Cannot establish a looparound because the previously-established looparound was not removed. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If the test fails with the same error code, replace the circuit pack.
	FAIL	The board is writing on unauthorized TDM time slots. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If the failure persists, replace the circuit pack.
	PASS	The board is not talking to unauthorized time slots on the TDM Bus.

Expansion Interface 2-way Transmission Test (#241)

This test is non-destructive and applies to all ATM-EIs, both active and standby. It is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing. The test sets up a connection between a Tone/Clock in one cabinet and a Tone Detector in a separate cabinet and transmits a digital test count between the port networks. The ATM-EIs used to set up this connection are chosen by maintenance, not call processing. After the connection is checked for dial-tone, the connection is torn down and re-established in the opposite direction.

In this test the second ATM-EI may be in any port network outside the port network of the ATM-EI under test. Therefore if the test should fail in any direction, the test is repeated with a different port network, if available, which aids the fault isolation procedure.

The test results indicate if the test failed in one or both directions. The test aborts if the ATM-EIs do not exist on both ends (for example, the EIs are not administered correctly). If the test passes, the TDM and ATM framer interfaces of both ATM-EIs are functioning properly. If the test fails, a series of tests are run on the board. [Figure 10-7](#) shows a schematic of this test.

Figure 10-7. Expansion Interface 2-Way Transmit Test #241
 PN X and PN Y represent any of 43 possible port networks.

Table 10-79. Expansion Interface 2-way Transmission Test (#241)

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out of service due to TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 3 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present, or some tone detectors may be out of service. 1. Resolve any TTR-LEV errors. Even if there are not TTR-LEV errors, there may not be a tone detector available on the network that contains the circuit pack being tested. Verify that there is at least one tone detector on this network. If not, this test always aborts for this ATM-EI circuit pack, but does not harm the system. ⇒ NOTE: DEFINITY Systems require that Tone Clock circuit packs (TN2182) must be of vintage "B" or newer. If older Tone Detector circuit packs are installed in the system, this test always aborts with this abort code. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 3 times.

Table 10-79. Expansion Interface 2-way Transmission Test (#241) — Continued

Error Code	Test Result	Description/ Recommendation
1033	ABORT	<p>The test cannot run because either the ATM-EI board is not administered, or there were no other PNs administered that had its ATM-EI board in-service.</p> <ol style="list-style-type: none"> 1. Ensure that the board is administered as ATM PNC Expansion Interface circuit pack. If the board is administered as ATM-EI circuit pack, then there has been some change in the ability of the ATM-EI circuit pack in the other PNs to communicate with the ATM-EI on the other end of its connection. 2. Using status port x (the port-network number in which the board is administered), see if both ACL and EAL are up to this board. If they are not, see the service procedure for SYS-LINK. 3. Check the Error Log for Error Type 1281 with Aux Data 27 (board cannot talk to the ATM switch). See Table 10-76 for repair procedures. If present, check both the ATM switch and the DEFINITY administrations for consistent ATM addresses. Reset the board and see if the problem resolves. 4. Repeat Test #241. If it continues to abort with this abort code, replace the board.
1394	ABORT	<ol style="list-style-type: none"> 1. See Table 10-76 (Error Type 1281) with Aux Data 27 (board cannot talk to the ATM switch), and if present, check both the ATM switch and the DEFINITY administrations for consistent ATM addresses. 2. Reset the board and see if the problem resolves. 3. Repeat the test.
1395	ABORT	<p>This test cannot run on an ATM-EI circuit pack if it is part of the B-side PNC and Duplicated PNC is not enabled.</p> <ol style="list-style-type: none"> 1. If this test needs to run on this ATM-EI circuit pack, enable PNC with the change system-parameters duplication command. 2. Prevent the system from doing a PNC interchange by executing the set PNC lock command. 3. Repeat this test.
1413	ABORT	<p>This test requires the use of a Tone/Clock circuit pack in each of the port networks (PN) used in this test. This abort code indicates that a Tone/Clock circuit pack is not present in one of the PNs.</p> <ol style="list-style-type: none"> 1. Make sure that there is a Tone/Clock circuit pack located in the PN in which the ATM PNC Expansion Interface circuit pack under test is located. 2. In ATM PNC configurations, make sure that there is at least one other PN besides the PN where the ATM-EI circuit pack under test resides that contains a Tone/Clock circuit pack.

Table 10-79. Expansion Interface 2-way Transmission Test (#241) — Continued

Error Code	Test Result	Description/ Recommendation
1414	ABORT	The active Tone/Clock circuit pack in one of the port networks being used for the test has a MAJOR or MINOR alarm logged against it. 1. Enter display alarms and resolve any TONE-BD and TONE-PT alarms.
1956	ABORT	ACL to the board is not up. See ACL status with the list sys-link command and follow the repair procedures for SYS-LINK.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	FAIL	The test tone was not detected correctly in either direction. 1. Use the status system all command to determine the active Tone/Clock. 2. Test the active Tone/Clocks on the Port Networks for which the ATM-EI circuit pack under test provides a link. This determines if the dial tone is supplied.
10MM	FAIL	The failure codes only apply to a system equipped with an ATM Switch. The letters "MM" refer to the distant or far-end port network (PN), and "NN" to the near-end ATM-EI under test. The test tone was detected correctly in forward direction (data sent from the PN in which the circuit pack under test resides and detected correctly in port network MM), but not the opposite direction. 1. Use the status system all command to determine the active Tone/Clock. 2. Test the active Tone/Clocks on the "MM" PN and the PN in which the ATM-EI under test resides (test tone-clock UUCSS). This determines if dial tone is supplied. 3. Ensure that the ATM address of the ATM-EI circuit pack under test matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to the " ATM Tips " section in Chapter 5 for the procedure to check the ATM port address on the ATM switch. 4. Run this Test #241 on the active ATM-EI in port network MM. If this test fails with Error Code 10NN or 30NN, go back to Step 2. If the address was the same, replace the active ATM-EI circuit pack on port network MM. If this test fails with Error Code 20NN or 40NN, replace ATM-EI circuit pack that had the initial problem.

Table 10-79. Expansion Interface 2-way Transmission Test (#241) — Continued

Error Code	Test Result	Description/ Recommendation
40MM	FAIL	<p>Failure code only applies to a system equipped with an ATM Switch. The letters “MM” refer to the distant or far-end port network (PN), and “NN” to the near-end ATM-EI under test.</p> <p>The test failed for the first connection from the ATM-EI board under test to another EPN, and the test tone was detected correctly in the reverse direction (data sent from the MM port network was detected correctly in the port network in which the circuit pack under test resides), but not the opposite direction.</p> <ol style="list-style-type: none"> 1. Test for the Active Tone-Clocks on the MM PN and the PN in which the ATM-EI under test resides. This determines if dial tone is supplied. 2. Ensure that the ATM address of the active ATM-EI circuit pack in port network MM matches the ATM address on the ATM switch for the port to which this circuit pack is connected. Refer to the “ATM Tips” section in Chapter 5 for the procedure to check the ATM port address on the ATM switch. 3. Run this Test #241 on the active ATM-EI in port network MM. If this test fails with Error Code 20NN or 40NN, go back to Step 2. <p>If the address was the same, replace the active ATM-EI circuit pack on port network MM.</p> <p>If this test fails with Error Code 10NN or 30NN, replace ATM-EI circuit pack with the initial problem.</p>
	PASS	<p>Tone successfully transmitted in both directions. Both ATM-EI boards and their lightwave transceivers are functioning properly.</p>
0	NO BOARD	<p>No board was detected by the test.</p> <ol style="list-style-type: none"> 1. Resolve either wrong board (Error 125) or no board (Error 131) issues. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Expansion Interface Lock Query Test (#304)

This test is non-destructive and is used to query the ATM and EI circuit packs (both active and standby) for its status concerning lock to the backplane system clock. It is run as part of periodic, scheduled, initialization, and error analysis

testing. When an in-line, "out-of-lock" report comes in, this test is run to check the circuit pack's status. The ATM-EI responds with "in lock" or "out of lock." If the response is "in lock," the test passes; if the response is "out of lock," the test fails.

Table 10-80. TEST #304 Expansion Interface Lock Query Test (#304)

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	FAIL	The ATM-EI circuit pack responded incorrectly or if it is the EPN active ATM-EI circuit pack, it could not talk to EPN circuit packs. 1. If the active ATM-EI circuit pack in the EPN is failing and duplicated PNC is enabled, attempt to switch to the standby PNC using the reset PNC interchange command. 2. Repeat the short test sequence. 3. If test continues to fail, reset the ATM-EI circuit pack with the reset board UUCSS command. 4. If the ATM-EI circuit pack in the EPN is failing, enter display errors and display alarms and follow the associated repair procedures for TDM-CLK, TONE-BD, or SYNC alarms/errors and repeat the Short Test Sequence. 5. If test continues to fail, replace the circuit pack or transceiver.
	PASS	Communication from software to the ATM-EI circuit pack is functioning correctly.
0	NO BOARD	No board was detected by the test. 1. Check the error log for wrong board (error 125) or no board (error 131). Resolve either of these issues. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (error 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the NCE chip on board may be bad. Replace the board and retest.

Expansion Interface Control Channel Test (#316)

This test is non-destructive. If an ATM-EI circuit pack is an *active* ATM-EI in the EPN (yellow LED on long/off short), the Expansion Interface Control Channel test checks to see if the ATM-EI circuit pack can communicate with other circuit packs in the EPN using the EPN TDM bus.

If the circuit pack is a *standby* ATM-EI (yellow LED off) or if the ATM PNC Expansion Interface is in the PPN (yellow LED on), this test queries the ATM PNC Expansion Interface circuit pack for its circuit pack type and vintage information.

Table 10-81. Expansion Interface Control Channel Test #316

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	FAIL	The ATM-EI circuit pack responded incorrectly or if it is the EPN active ATM-EI circuit pack, it could not talk to EPN circuit packs. 1. If the active ATM-EI circuit pack in the EPN is failing and duplicated PNC is enabled, attempt to switch to the standby PNC using the reset PNC interchange command. 2. Repeat the short test sequence. 3. If test continues to fail, reset the ATM-EI circuit pack with the reset board UUCSS command. 4. If the ATM-EI circuit pack in the EPN is failing, enter display errors and display alarms and resolve any TDM-CLK, TONE-BD, or SYNC alarms/errors and repeat the Short Test Sequence. 5. If test continues to fail, replace the circuit pack or transceiver.
	PASS	The ATM-EI circuit pack did respond correctly to test. Communication from software to the ATM-EI circuit pack is functioning. 1. Refer to other ATM-EI circuit pack tests if the link is not functioning correctly.

Table 10-81. Expansion Interface Control Channel Test #316 — Continued

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	No board was detected by the test. <ol style="list-style-type: none"> 1. Resolve any wrong board (Error 125) or no board (Error 131) issues. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the NCE chip on board may be bad. Replace the board and retest.

Packet Interface Test (#598)

This test is non-destructive and attempts to send a data packet from the TN1655 Packet Interface circuit pack through any ATM PNC Expansion Interface circuit packs. The path the data packet takes depends on the location of the ATM-PNC Expansion Interface circuit pack being tested and whether the system has duplicate Port Network Connectivity.

The Packet Interface Looparound test checks the Packet Bus interface circuitry on this board. The on-board LANHO chip sends a data stream to the bus, retrieves it back, and checks for its consistency. If the data is consistent, the test passes; otherwise, it fails. The test aborts if the Packet Bus in the specified port network has a minor alarm active, is out of service, or if the Packet Bus in the PPN is out of service. This test runs as a part of initialization, periodic, scheduled, error analysis, and demand test sequences. [Figure 10-8](#) shows a schematic of the test.

Figure 10-8. Packet Interface Test (#598)

Table 10-82. Packet Interface Test (#598)

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals for a maximum of 3 retries.2. If the test fails repeatedly, attempt to reset the circuit pack.3. If the test continues to fail, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals a maximum of 5 times.
ANY	FAIL	The transmitted data packet was not received correctly by the Packet Interface circuit pack. The failure may be in the ATM-EI under test, the DS1 CONV circuit packs, or the intervening Center Stage components. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals a maximum of five times2. If the test continues to fail, replace the circuit pack.
	PASS	The Packet Interface Test passed.

ATM Board DSP Test #1258 (TN2238 only)

This test is non-destructive and is designed to test the board's interface to the TDM bus and the functions of all 24 on-board DSPs (Digital Signal Processors). This looparound test is completely on-board, and the results for each DSP are saved until all DSPs are tested.

If the test fails for all DSPs, a MAJOR alarm is raised against the board. If the test fails for one or more DSPs, the test fails and a MINOR alarm is raised. If a DSP is "busy," the test for that particular DSP is considered passed. The test aborts if the system resources (for example, the TDM time slots, tone generator, and others) are not available. This test applies to all ATM-EIs, both active and standby, and is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing. Refer to [Figure 10-9](#) for a diagram of this looparound test.

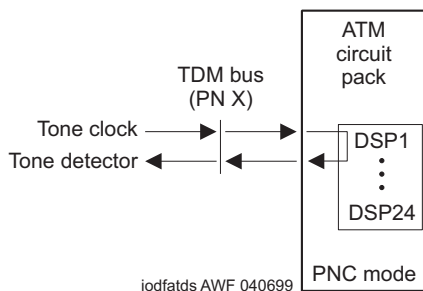

Figure 10-9. ATM Board DSP Test (#1258)

Table 10-83. ATM Board DSP Test (#1258)

Error Code	Test Result	Description/ Recommendation
1002	ABORT	<p>The system could not allocate timeslots for the test. The system may be under heavy traffic conditions or it may have timeslots out of service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 3 times.
1003	ABORT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present, or some tone detectors may be out of service.</p> <ol style="list-style-type: none"> 1. Enter display errors and resolve any TTR-LEV errors. Even if there are not TTR-LEV errors, there may not be a tone detector available on the network that contains the circuit pack being tested. Verify that there is at least one tone detector on the network. If not, this test always aborts for this ATM-EI circuit pack and does not harm the system. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 3 times.

Continued on next page

Table 10-83. ATM Board DSP Test (#1258) — Continued

Error Code	Test Result	Description/ Recommendation
1395	ABORT	This test cannot be run on an ATM-EI circuit pack if it is part of the B-side PNC, and the duplicated PNC is not enabled. <ol style="list-style-type: none"> 1. If this test needs to run on this ATM-EI circuit pack, enable PNC with the change system-parameters duplication command. 2. Prevent the system from doing a PNC interchange (set PNC lock). 3. Repeat this test.
2000	ABORT	Response to the test was not received within the allowable time period for some of the DSPs. <ol style="list-style-type: none"> 1. If the board is in standby, reset the board and run the test again once the board is inserted. 2. Check the Error Log for Error Type 1218 (bad DSP). If Error Type 1218 is not logged against this board, run the DSP test again and see if the error persists.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error
2751	ABORT	All DSPs are busy (very unlikely). <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times.
2752	ABORT	The circuit pack in this location is not an ATM pack.
10XX, where XX = DSP# 01-24	FAIL	There is at least one bad DSP on the board. The 10XX value indicates the DSP number that has failed the test. However, the failure of these DSPs does not indicate that all of the DSPs failed. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If the test fails with the same error code, replace the board.
30XX, where XX = DSP# 01-24	FAIL	At least one DSP has failed because the test tone was not detected correctly after being looped through the DSP. The 30XX value indicates the DSP number that has failed the test. The failure of these DSPs does not indicate that all of the DSP failed due to incorrect tone detection. <ol style="list-style-type: none"> 1. Run the tests for the Active Tone-Clock on the PN that contains the indicted ATM-EI circuit pack to verify that dial-tone is supplied. 2. If the tone-clock is healthy, repeat the short test on the ATM-EI board. 3. If this test continues to fail, replace the ATM-EI circuit pack.

Continued on next page

Table 10-83. ATM Board DSP Test (#1258) — Continued

Error Code	Test Result	Description/ Recommendation
60XX, where XX = DSP# 01-24	FAIL	Cannot establish a looparound, because the previously established looparound was not removed. The 60XX value indicates the DSP number that has failed the test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If the test fails with the same error code replace the board.
	PASS	Test tone was correctly detected on both TDM Busses. <ol style="list-style-type: none"> 1. Refer to other ATM-EI circuit pack tests if the links between this ATM-EI circuit pack and the ATM-EI or Switch Node Interface circuit pack on the other end of the fiber are not functioning correctly.
0	NO BOARD	No board was detected by the test. <ol style="list-style-type: none"> 1. Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the NCE chip on the circuit pack may be bad. Replace the circuit pack and retest.

ATM Board Error Query Test (#1259)

This test is non-destructive. The ATM circuit pack firmware maintains counters for some of the on-board and off-board errors. The maintenance software queries the board for its health information to do error analysis. These alarms have assigned priority: if a higher priority alarm occurs, the remaining alarms are not reported to the software (through the inline errors), avoiding unnecessary up-link, in-line error message traffic. This is run as a part of a craft demand test sequence periodic testing, initialization, and error analysis.

Table 10-84. ATM Board Error Query Test (#1259)

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 3 times.
XXYY	FAIL	On-board hardware or off-board signalling errors on the board. XX indicates the on-board hardware error, and YY indicates the off-board errors on the as shown in Table 10-85 . 1. Resolve any errors in error logs.
	PASS	No service effecting errors or alarms were detected on the circuit pack.
0	NO BOARD	No board was detected by the test. 1. Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the NCE chip on board may be bad. Replace the board and retest.

Table 10-85. XXYY Aux Data for Test #1259 (ATM Board Error Query Test)

XX Aux Data	Description
1	ATM framer chip failed
2	NCE chip failed
3	LANHO critical error
4	TDM Prog. logic device failed
5	All on-board DSPs failed
6	Receive network processor failed
7	Transmit network processor failed
8	Memory read failed

**Table 10-85. XXYY Aux Data for Test #1259
 (ATM Board Error Query Test) — Continued**

XX Aux Data	Description
9	Dual UART chip failed
10	LANHO receive parity error
11	LANHO FIFO overflow error
12	LAN Bus timeout
13	LANHO Xmit FIFO overflow
14	One or more on-board DSPs failed
YY Aux Data	Description
15	Backplane clock failed
16	Loss of signal
17	Loss of frame
18	Multiplexer Section Alarm indication signal error
19	Multiplexer Section remote defect indicator error
20	Loss of pointer
21	Path signal level mismatch
22	High level path alarm indication signal
23	High level path remote defect indicator
24	Loss of cell delineation
25	Uncorrectable headers sent by the ATM switch
26	Too many cells with invalid Virtual Path Indicator (VPI)/Virtual Circuit Indicator (VCI) combination
27	The signalling link between the board and the ATM switch is down.
28	Board to the ATM switch connection is down
34	AAL5 (ATM signalling protocol) excessive retransmission requests
35	LAPD excessive retransmission requests

ATM Board Framer Looparound Test (#1260)

This test is destructive.

NOTE:

This test can be run on the standby PNC only if the board is busied out.

This test places the ATM circuit pack in ATM framer looparound mode. Once the board receives this message, it creates a dummy virtual circuit that originates and ends on the same board, without leaving the board. This test verifies both the TDM path and the Packet Path. If the TDM test path passes, then the packet path is tested. Definitions of each test path are:

- **The circuit (TDM) path:** one of the tone generators sends a bit pattern is through a TDM bus time slot to the ATM framer. The pattern is converted into ATM cells and looped back to the ATM-EI board, which converts the cell back into the bit pattern and puts it on a pre-determined time slot. A tone detector tests for the bit pattern and reports the test result. This test verifies that a large portion of the ATM-EIs circuit paths are functioning correctly. [Figure 10-10](#) shows a diagram of the test.

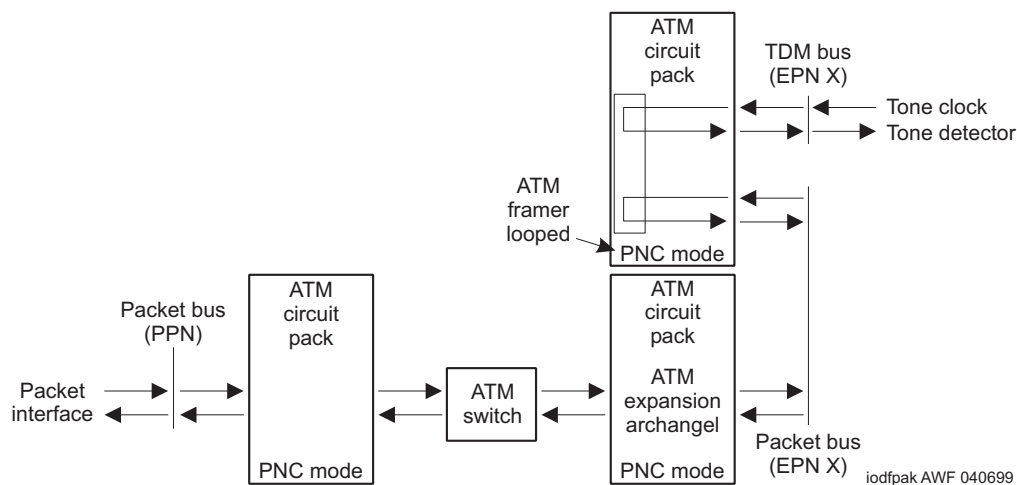

Figure 10-10. ATM Board Framer Looparound Test (#1260)

- **Packet path:** the Packet Interface circuit pack sends packet data to the ATM framer interface, where it is mapped into ATM cells and then looped around internally. The cells are converted back to packet data after it has been looped. This portion of the test verifies correct operation of the ATM-EI's Packet bus interface and a large portion of the ATM-EI's packet paths. [Figure 10-11](#) shows the packet switched signal path for the ATM circuit pack.

This test verifies the operation of a large portion of the ATM-EI circuit and packet paths, but does not verify the optical portion of the lightwave transceiver. If this test passes, the ATM-EI circuit pack is functioning correctly, but faults may exist in the lightwave transceiver. If the test fails, the fault may lie on the board. After the test results are reported, the ATM framer is taken out of loopback.

⇒ NOTE:

This test may be run on active or standby ATM-EIs, but it is *not* allowed if an ATM-EI is the Expansion Archangel.

**Figure 10-11. ATM Board Framer Looparound Test (#1260)
 (non-EAA, Packet Path)**

Table 10-86. ATM Board Framer Looparound Test (#1260)

Error Code	Test Result	Description/ Recommendation
1002	ABORT	<p>The system could not allocate timeslots for the test. The system may be under heavy traffic conditions or it may have timeslots out of service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 3 times.

Error Code	Test Result	Description/ Recommendation
1	FAIL	<p>The test did not detect the test tone through the looparound connection.</p> <p> NOTE: The packet portion of this test was not run since the circuit portion failed.</p> <ol style="list-style-type: none"> 1. Test the active Tone/Clock (test tone-clock UUCSS) on the PN that contains the defective ATM-EI circuit pack to verify that dial tone is being supplied. 2. If the Tone/Clock is healthy, test the ATM-EI circuit pack (test board UUCSS long). 3. If this test continues to fail, replace the ATM-EI circuit pack or transceiver. 4. Test the new ATM-EI circuit pack (test board UUCSS long).
2	FAIL	<p>The test tone was transmitted and detected correctly, but the correct data packet was not detected by the Packet Interface circuit pack.</p> <ol style="list-style-type: none"> 1. Test the Packet Interface circuit pack to verify that it is functioning properly. If any tests fail, investigate those tests and repair the Packet Interface circuit pack. 2. If the Packet Interface circuit pack is OK, resolve any DS1 CONV-BD alarms or errors (if so equipped). 3. Test the ATM-EI circuit pack (test board UUCSS long). 4. If this test continues to fail, replace the ATM-EI board. 5. Test the new ATM-EI circuit pack (test board UUCSS long).
3	FAIL	<p>The test tone was transmitted correctly, but the returned tone was distorted.</p> <ol style="list-style-type: none"> 1. If the Tone/Clock is healthy, test the ATM-EI circuit pack (test board UUCSS long). 2. If this test continues to fail, replace the ATM-EI circuit pack. 3. Test the new ATM-EI circuit pack (test board UUCSS long).
4	FAIL	<p>Unable to create loop for TDM path for this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If this test continues to fail, replace the ATM-EI circuit pack. 3. Test the new ATM-EI circuit pack (test board UUCSS long).

Continued on next page

Table 10-86. ATM Board Framer Looparound Test (#1260) — Continued

Error Code	Test Result	Description/ Recommendation
5	FAIL	Unable to create loop for packet path for this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If this test continues to fail, replace the ATM-EI circuit pack. 3. Test the new ATM-EI circuit pack (test board UUCSS long).
6	FAIL	A previously-established looparound was not released. <ol style="list-style-type: none"> 1. Issue the reset board UUCSS command. 2. Retry the command at 1-minute intervals a maximum of 3 times. 3. If this test continues to fail, replace the ATM-EI circuit pack. 4. Test the new ATM-EI circuit pack (test board UUCSS long).
	PASS	The ATM-EI board is functioning properly, however this test does not verify that the optical portion of the lightwave transceiver is functioning.
0	NO BOARD	No board was detected by the test. <ol style="list-style-type: none"> 1. Resolve either wrong board (Error 125) or no board (Error 131) issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the NCE chip on board may be bad. Replace the board and retest.

ATM Board Time Of Day Update (#1261)

This test is non-destructive. The ATM circuit pack requires a reference time to do SDH/SONET performance monitoring. This test updates the system time to the board and synchronizes the board with the DEFINITY system clock during initialization, scheduled maintenance, and craft long test.

Table 10-87. ATM Board Time Of Day Update (#1261)

Error Code	Test Result	Description/ Recommendation
2031	FAIL	The attempt to send the message to the ATM-EI circuit pack was not successful.
2500	FAIL	Did not send the time of day information to the board. 1. Retry the command at 1-minute intervals a maximum of 3 times.
	PASS	The ATM-EI circuit pack is successfully updated with system time. 1. If the status port-network command still indicates that this link is down, it is possible that one or both of the ATM-EI circuit packs have been busied out. 2. If the link still does not come up, reset one or both ATM-EI circuit packs on the link.
0	NO BOARD	No board detected. 1. Resolve either wrong board (Error 125) or no board (Error 131) issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the NCE chip on the circuit pack may be bad. Replace the pack and retest.

ATM Board Reset (#1256)

This test is destructive. If the ATM-EI board is in the PPN or is a standby in the EPN, the reset is done through the SAKI reset interface. If the ATM-EI is an Expansion Arch Angel (active ATM-EI board in the EPN) a special message is sent to the board over the EAL if the EAL is present.

Table 10-88. ATM Board Reset (#1256)

Error Code	Test Result	Description/ Recommendation
1386	ABORT	No Active EAL to the board. This error applies only if the board under test is in EPN. Check the error logs for SYS-LINK errors against the port network in which the ATM-EI is residing and take appropriate diagnostic action for the SYS-LINK.

Table 10-88. ATM Board Reset (#1256) — Continued

Error Code	Test Result	Description/ Recommendation
1015	ABORT	This test cannot be run because the ATM-TRK circuit pack has not been busied out. 1. Busyout the ATM circuit pack, then repeat the test board UUCSS long command.
1407	ABORT	1. Perform a PNC Interchange 2. Try to reset the board again.
None	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort escalate the problem.
2000	ABORT	Did not receive the SANITY response in the given time. 1. Wait for 5 minutes and see if board is visible to the system by using list config all command. 2. If the board is visible, run the test again. If same abort code results, escalate the problem. 3. If the board is not visible to the system via list config all command, re-seat the board. 4. If the board is still not recognized by the system, replace the board.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500	ABORT	Internal system error 1. Try to reset the board again.
1	FAIL	The circuit pack failed to reset
2	FAIL	The circuit pack failed to restart. 1. Execute command again. 2. If the problem persists, replace the circuit pack.
	PASS	The ATM-EI circuit pack is successfully reset. 1. If the status port-network command still indicates that this link is down, it is possible that one or both of the ATM-EI circuit packs are busied out. 2. If the links do not come up after reset, review the error logs and take appropriate diagnostic action.

ATM Cross Talk Test (#1298) (TN2305/6 only)

This test is non-destructive. The ATM board Cross Talk test verifies that the selected TDM bus time slot never crosses over to time slots reserved for other connections. The test also checks for cross connections, where the board talks to time slots other than those specified. Since this test uses many system resources (TDM time slots, tone generator, tone detector, and others), it runs as a part of demand test only.

This test fails if either the TDM programmable logic and/or the interface to the DSP is not operating properly. Failure of these components may result in one-way or noisy connections. Refer to [Figure 10-12](#) for a schematic of this test.

⇒ NOTE:

Note: This test applies only to TN2305 and TN2306 circuit packs.

Figure 10-12. ATM Cross Talk Test #1298 schematic

Table 10-89. ATM Crosstalk Test (#1298)

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-Bus errors. Refer to TDM-BUS to diagnose these errors. 1. If system has no TDM-Bus errors and is not handling heavy traffic, repeat test at 1-minute intervals for a maximum of 5 times.

Table 10-89. ATM Crosstalk Test (#1298) — Continued

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service. <ol style="list-style-type: none"> 1. Resolve any TTR-LEV errors in the Error Log. 2. Resolve any TONE-PT errors in the Error Log. 3. If neither condition exists, retry the test at 1-minute intervals for a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1962	ABORT	All the TALKER DSPs are busy (an unlikely event). <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times.
2302	ABORT	Inconsistent uplink message from the ATM-EI board. This is a very unlikely event. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times.
2752	ABORT	The circuit pack in this location is not a TN2305/TN2306.
1-8, None	FAIL	The board is writing to unauthorized TDM time slots. The error code indicates the number of faulted TALKER DSPs. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 3 times. 2. If the failure persists, replace the circuit pack.
1-8	PASS	The board is not talking to unauthorized time slots on the TDM Bus. The error code indicates the number of TALKER DSPs that were tested.

ATM Board DSP Test (#1293)

This test is non-destructive and is designed to test the board's interface to the TDM bus and the functions of all 24 on-board DSPs (Digital Signal Processors). There are three functional types of DSPs:

- talkers - put data on the TDM bus
- listeners - take data off the TDM bus
- echo cancelers - as implied

Listener and echo cancelers are tightly coupled because firmware allocates *sets* of DSPs. Since there are a total of 24 DSPs on the board, there may be up to 8 triplets allocated.

If the test fails for all DSPs, a MAJOR alarm is raised against the board. If the test fails for one or more DSPs, a MINOR alarm is raised. If a DSP is "busy," the test for that particular DSP is considered passed. The test aborts if the system resources (for example, the TDM time slots, tone generator, and others) are not available.

This test applies to TN2305 and TN2306 ATM-EIs, both active and standby, and is run as part of craft short and long testing, periodic, scheduled, initialization, and error analysis testing. Refer to [Figure 10-13](#) for a diagram of this looparound test.

Figure 10-13. ATM Board DSP Test (#1293)

Table 10-90. ATM Board DSP Test (#1293)

Error Code	Test Result	Description/ Recommendation
1002	ABORT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out of service due to TDM-BUS errors.</p> <ol style="list-style-type: none"> If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 3 times.

Table 10-90. ATM Board DSP Test (#1293) — Continued

Error Code	Test Result	Description/ Recommendation
XYZ	FAIL	<p>A device on the circuit pack is failing. There is at least one bad DSP on the board. Values are as follows:</p> <ul style="list-style-type: none"> ■ The X value indicates the number of talker DSPs ■ Y indicates the number of listener DSPs ■ Z indicates the number of Echo Canceler DSPs that have failed the test. <ol style="list-style-type: none"> 1. Run the tests for the active Tone-Clock on the PN that contains the indicted ATM-EI circuit pack to verify that dial-tone is supplied. 2. If the tone-clock is healthy, repeat the short test on the ATM-EI board. 3. If this test continues to fail, replace the ATM-EI circuit pack.
XYZ	PASS	<p>The test passed for some or all DSPs depending on XYZ values. XYZ indicates the number of talker, listener and echo-canceler DSPs for which the test passed, respectively. In the DSPs that passed the test, the test tone was correctly detected by the DSP Listener and by tone-detector for the DSP Talkers on both busses, and the Echo Canceler DSPs are working properly.</p>
0	NO BOARD	<p>No board was detected by the test.</p> <ol style="list-style-type: none"> 1. Check the Error Log for wrong board (Error Type 125) or no board (Error Type 131). Resolve either of these issues, if applicable. 2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error Type 1538). If hyperactive, use the reset board UUCSS command. 3. Run the test again. If it fails, the circuit pack may be bad. Replace the circuit pack and retest.

ATM-INTF (TN2305/6)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ATM-INTF	WARNING	test board UUCSSpp	ATM interface board

The TN2305/6 is recognized by the system as an ATM Interface board (ATM-INTF) if it has not been assigned a personality through the **add atm-pnc** command or **add atm trunk** command. ATM-INTF does not have a maintenance strategy associated with it, although the Control Channel test can be run on demand by using the **test board** command, and the board can be reset by using the **reset board** command. The board is visible through the **list config** and **change circuit-pack** commands.

The circuit packs listed in [Table 10-91](#) are ATM-EI boards if they are administered to serve the ATM Port Network Connectivity (ATM-PNC).

Table 10-91. ATM-EI circuit packs for ATM-PNC

Circuit pack	Fiber	Echo cancellation	Release
TN2238	Multi mode	N	6.3
TN2305	Multi mode	Y	7.1
TN2306	Single mode	Y	7.1

NOTE:

Always replace an ATM-EI circuit pack with the same type.

LED states

The ATM-INTF circuit pack has the standard red, green and yellow LEDs. The red and green LEDs have the traditional use: red indicates an alarm condition, green means maintenance testing in progress. The yellow LED is not used. The possible LED states are listed below:

LED	Condition	LED
Red	Board is not healthy	Solid on never off
Red Green	Board is in the processes of booting	Red: solid on Green: 200 ms on 200 ms off
Green	Maintenance is running tests on the board	Solid on (off when maintenance completed)
Yellow	Fiber LOS	100 ms on, 100ms off
Yellow	Signal to the ATM switch is down	500 ms on, 500 ms off

Error Log Entries and Test to Clear Values

Table 10-92. ATM-INTF Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
23(a)	0	None	WAR	OFF	
125(b)		None	MIN	ON	
217(c)	0	None	WAR	OFF	

Notes:

- a. Error Type 23: ATM Expansion Interface circuit pack is administered through a **change circuit-pack** command, but has not been inserted into the system. Insert the circuit pack.
- b. Error Type 125: A wrong circuit pack is located in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack or insert the logically administered circuit pack.
- c. Error Type 217: The ATM circuit pack is physically present but has not been given a personality. Remove the circuit pack or administer it using the **add atm pnc** command or **add atm trunk** command.

System Technician-Demanded Tests: Descriptions and Error Codes

Failure of this test is not logged in the Error Log.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Control Channel Loop Around Test (#52)	X	X	N

¹ D = Destructive, ND = Non-destructive

Control Channel Loop-Around Test (#52)

This test is non-destructive. This test queries the circuit pack for its circuit pack code and vintage and verifies its records.

Table 10-93. TEST #52 Control Channel Loop-Around Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available.
2500	ABORT	Internal system error 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	The circuit pack failed to return the circuit pack code or vintage. 1. Retry the command a few times for a maximum of 5 times. 2. If the problem continues to fail, reset the circuit pack. 3. Retry the command a few times for a maximum of 5 times.
	PASS	Communication with this circuit pack is successful.
Any	NO BOARD	This is normal if the test is being done when: ■ the board is not physically in the system. ■ the system is booting up. Otherwise, there is some inconsistency in the data kept in the system. 1. Verify that the board is physically in the system. 2. Verify that the system is not in the process of booting up. 3. Retry the command at 1-minute intervals for a maximum of 5 times.

ATM-NTWK (ATM Network Error)

MO Name (in Alarm Log)	Physical Name in Error Logs ¹	Alarm Level	Full Name of MO
ATM-NTWK	ATUUP	WARNING	ATM Network Error

- 1 *AT* indicates it is an ATM switch related address, *UU* is the connection number. The connection number can be converted into a board location by the command **display atm pnc UU**, which shows the translations for the board that reported the ATM network error. *P* indicates if the ATM-EI board (reporting the ATM network error) is the A side or the B side of the PNC. If the system is simplex, only A is valid.

In the ATM PNC configuration, the proprietary Center Stage Switch (CSS) is replaced by the ATM switch. Since the CSS switch nodes are replaced by the ATM switch in the ATM PNC configuration, the SNI boards are no longer needed. In place of SNI board, the ATM_EI boards are connected to an ATM switch port over a fiber optic cable. The port on the ATM switch is under the control of ATM switch maintenance software. Refer to [Figure 5-18](#) in the “ATM Tips” section in Chapter 5 for a schematic of these connections.

An error against this MO indicates a problem in the ATM network (including the ATM switch) that is affecting the service quality. These error events are reported by the ATM network to the ATM-EI board. Since these errors are *not* related to the ATM-EI board, these errors are not reported against ATM-EI Maintenance Object. These log-only errors require no action by DEFINITY maintenance software.

Error Codes and Aux Data values

The Cause Code and Error Type information from the ATM network is shown in [Table 10-94](#). These are the errors that are logged when the Cause Code or Error Type is received from the network. Six-digit codes against the ATM-NTWK maintenance object are possible:

- The first two characters represent ATM
- The next two characters stand for the connection number
- The last character indicates if it is A or B side of the PNC.

If the ATM-NTWK Maintenance Object receives more than 6 errors, the oldest errors are overwritten unless it has been less than 6 minutes since the oldest reported error.

Table 10-94. Error Codes and Aux Data values ATM-NTWK

Cause Code/ Error Type	Aux Data	Cause Codes Description
NORMAL EVENTS		
0	(a)	Network unreachable
1	(a)	Unallocated (unassigned) number. This cause indicates that the called party cannot be reached because, although the number is in a valid format, it is not currently assigned (allocated).
2	(a)	No route to specified transit network. This cause indicates that the equipment sending this cause has received a request to route the call through a particular network which it does not recognize, either because the transit network does not exist or because that particular transit network does not serve the equipment which is sending this cause. This cause is supported on a network-dependent basis.
3	(a)	No route to destination. This cause indicates that the called party cannot be reached because the network through which the call has been routed does not serve the destination desired. This cause is supported on a network-dependent basis.
10	(a)	VPCI/VCI unacceptable. This cause indicates that the virtual channel most recently identified is not acceptable to the sending entity for use in this call.
16	(a)	Normal call clearing. This cause indicates that the call is being cleared because one of the users involved in the call has requested that the call be cleared. Under normal situations, the source of this cause is not the network.
17	(a)	User busy. This cause indicates that the called party is unable to accept another call because the user busy condition has been encountered. This cause value may be generated by the called user or by the network.
18	(a)	No user responding. This cause is used when a called party does not respond to a call establishment message with a connect indication within the prescribed period of time allocated.
21	(a)	Call rejected. This cause indicates that the equipment sending this cause does not wish to accept this call, although it could have accepted the call because the equipment sending this cause is neither busy nor incompatible.
22	(a)	Number changed. This cause is returned to a calling party when the called party number indicated by the calling user is no longer assigned. The new called party number may optionally be included in the diagnostic field. If a network does not support this capability, cause number 1 "unassigned (unallocated) number" is used.

Table 10-94. Error Codes and Aux Data values ATM-NTWK — Continued

Cause Code/ Error Type	Aux Data	Cause Codes Description
23	(a)	User rejects all calls with calling line identification restriction (CLIR). This cause is returned by the called party when the call is offered without calling party number information and the called party requires this information.
27	(a)	Destination out of order. This cause indicates that the destination indicated by the user cannot be reached because the interface to the destination is not functioning correctly. The term "not functioning correctly" indicates that a signalling message was unable to be delivered to the remote user; for example, a physical layer or SAAL failure at the remote user or user equipment off-line.
28	(a)	Invalid number format (address incomplete). This cause indicates that the called user cannot be reached because the called party number is not in a valid format or is not complete.
30	(a)	Response to STATUS ENQUIRY. This cause is included in the STATUS message when the reason for generating the STATUS message was the prior receipt of a STATUS ENQUIRY message.
31	(a)	Normal, unspecified. This cause is used to report a normal event only when no other cause in the normal class applies.
32	(a)	DTL transit not-my-node ID
RESOURCE UNAVAILABLE		
35	(a)	Requested VPCI/VCI not available. This cause indicates that the requested VPCI/VCI is not available.
36	(a)	VPCI/VCI assignment failure
37	(a)	User Cell Rate not available
38	(a)	Network out of order. This cause indicates that the network is not functioning correctly and that the condition is likely to last a relatively long period of time; for example, immediately re-attempting the call is not likely to be successful.
41	(a)	Temporary failure. This cause indicates that the network is not functioning correctly and that the condition is not likely to last a long period of time; for example, the user may wish to try another call attempt immediately.
43	(a)	Access information discarded. This cause indicates that the network could not deliver access information to the remote user as requested; that is, ATM adaptation layer parameters, Broadband low layer information, Broadband high layer information, or sub-address as indicated in the diagnostic.
45	(a)	No VPCI/VCI available. This cause indicates that there is no appropriate VPCI/VCI presently available to handle the call.

Table 10-94. Error Codes and Aux Data values ATM-NTWK — Continued

Cause Code/ Error Type	Aux Data	Cause Codes Description
47	(a)	Resource unavailable, unspecified. This cause is used to report a resource unavailable event only when no other cause in the resource unavailable class applies.
SERVICE OR OPTION UNAVAILABLE		
49	(a)	Quality of Service unavailable. This cause is used to report that the requested Quality of Service cannot be provided.
51	(a)	User cell rate not available. This cause is used to report that the requested ATM Traffic Descriptor is unobtainable.
57	(a)	Bearer capability not authorized. This cause indicates that the user has requested a bearer capability which is implemented by the equipment which generated this cause but the user is not authorized to use.
58	(a)	Bearer capability not presently available. This cause indicates that the user requested a bearer capability implemented by the equipment that generated the cause but is not available at this time.
63	(a)	Service or option not available, unspecified. This cause is used to report a service or option not available event only when no other cause in the service or option not available class applies.
65	(a)	Bearer capability not implemented. This cause indicates that the equipment sending this cause does not support the bearer capability requested.
73	(a)	Unsupported combination of traffic parameters. This cause indicates that the combination of traffic parameters contained in the ATM traffic descriptor information element is not supported.
78	(a)	AAL parameters cannot be supported.
INVALID MESSAGES		
81	(a)	Invalid call reference value. This cause indicates that the equipment sending this cause has received a message with a call reference which is not currently in use on the user-network interface.
82	(a)	Identified channel does not exist. This cause indicates that the equipment sending this cause has received a request to use a channel not activated on the interface for a call.
88	(a)	Incompatible destination. This cause indicates that the equipment sending this cause has received a request to establish a call which has Broadband low layer information, Broadband high layer information, or other compatibility attributes which cannot be accommodated.

Table 10-94. Error Codes and Aux Data values ATM-NTWK — Continued

Cause Code/ Error Type	Aux Data	Cause Codes Description
89	(a)	Invalid endpoint reference value. This cause indicates that the equipment sending this cause has received a message with an endpoint reference that is currently not in use on the user-network interface.
91	(a)	Invalid transit network selection. This cause indicates that a transit network identification was received in an incorrect format as defined in Annex D.
92	(a)	Too many pending add party requests. This cause indicates a temporary condition when the calling party sends an add party message, but the network is unable to accept another add party message because its queues are full.
93	(a)	AAL parameters cannot be supported. This cause indicates that the equipment sending this cause has received a request to establish a call with ATM adaptation layer parameters that cannot be accommodated.

PROTOCOL ERROR

96	(a)	Mandatory information element is missing. This cause indicates that the equipment sending this cause has received a message that is missing an information element.
97	(a)	Message type non-existent or not implemented. This cause indicates that the equipment sending this cause has received a message with a message type it does not recognize either because this is a message not defined or defined but not implemented by the equipment sending this cause.
99	(a)	Information element non-existent or not implemented. This cause indicates that the equipment sending this cause has received a message that includes information element(s) not recognized because the information element identifier(s) are not defined or are defined but not implemented by the equipment sending the cause. This cause indicates that the information element was discarded. However, the information element is not required to be present in the message in order for the equipment sending this cause to process the message.
100	(a)	Invalid information element contents. This cause indicates that the equipment sending this cause has received and implemented an information element. However, one or more of the fields in the information element are coded in such a way that has not been implemented by the equipment sending this cause.
101	(a)	Message not compatible with call state. This cause indicates receipt of a message that is incompatible with the call state.

Table 10-94. Error Codes and Aux Data values ATM-NTWK — Continued

Cause Code/ Error Type	Aux Data	Cause Codes Description
102	(a)	Recovery on timer expiration. This cause indicates that a procedure has been initiated by the expiration of a timer in association with error handling procedures.
104	(a)	Incorrect message length
111	(a)	Protocol error, unspecified. This cause is used to report a protocol error event only when no other cause in the protocol error class applies.

Note:

- a. Aux Data values (XX = Port Network, YYY = location code).

[Table 10-95](#) is a list of UNI 3.1 location codes:

Table 10-95. Location codes from Aux Data values

Setup (Location Code)	Add Party (Location Code)	Location Code Meaning
0	500	User
1	501	Private network serving the local user
2	502	Public network serving the local user
3	503	Transit network
4	504	Public network serving the remote user
5	505	Private network serving the remote user
6	506	International network
7	507	Network beyond interworking point

NOTE:

Under certain circumstances network errors can be against the ATM-EI board.

ATM PNC-DUP (ATM PNC Duplication)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
PNC-DUP	NA	status pnc	PNC duplication

The PNC-DUP maintenance object tracks the health of the active and standby PNCs, controls planned and spontaneous interchanges, and manages related functions such as double call refresh and unrefresh, antithrashing, and so on. The main responsibility of PNC-DUP is to recover the system to full service in the event of a fault. In the event of multiple faults, PNC-DUP does its best to maximize service continuity.

In systems with the Critical Reliability option, the following components, which together comprise the Port Network Connectivity (PNC), are duplicated:

- ATM-Expansion Interface (ATM-EI) circuit packs in the port networks (PNs)
- Fiber-optic cables connecting the above circuit packs to the ATM Switch Interface Modules
- ATM Switch

Although not part of the PNC, Tone-Clock circuit packs are also duplicated in each PN. All systems have one Processor Port Network (PPN). ATM PNC systems can have up to 43 EPNs.

PNC duplication architecture utilizes an active/standby duplication scheme in which one complete set of PNC components supports call processing, while the duplicate PNC is held in reserve. All calls on the active PNC are simultaneously set up, or shadowed, on the standby PNC in order for it to be capable of instantly assuming active status when necessary, allowing for interchanges without service disruption (in the case of single faults).

PNC duplication does not introduce any additional types of hardware or hardware faults, and there are no tests associated with the PNC-DUP MO. Instead, its error log entries contain useful information about the occurrence and causes of interchanges in order to facilitate diagnosis of problems, which can then be addressed by using the documentation for the individual maintenance object involved.

Busyouts and PNC-DUP

Busyout pnc puts the standby PNC in the busyout state. In this condition:

- Double call set up is turned off.

- The standby PNC is unrefreshed; existing duplicate call connections are removed.
- PNC interchanges are prevented.

Upon release, interchanges are re-enabled and a global refresh of double call setup on the standby is performed.

When PNC duplication is in effect:

- An active PNC component cannot be busied-out.
- A standby PNC component can only be busied-out when the standby PNC is first busied-out.
- The standby PNC cannot be released unless all standby PNC components are released.

Enabling and removing PNC Duplication

To enable PNC duplication, perform the following sequence of steps:

1. Enable administration of PNC-DUP on the **change system-parameters customer-options** form.
2. Fully administer duplicate fiber link connectivity. Verify by **list atm-pnc**.
3. Activate PNC-DUP through the **change system-parameters duplication** form. This is not allowed if any component of either PNC (A or B) is busied out.
4. The system must insert all connectivity-related components for both standby and active PNC, a process that takes up to 5 minutes, depending upon circuit pack insertion. The process is complete when the first terminal login prompt appears.
5. The PNC-DUP initialization anti-thrashing timer must expire (this occurs 5 minutes after completion of board insertion, PNC interchange, or system reset of level 2 or higher).

To disable PNC duplication perform the following sequence of steps:

1. Verify that the A-PNC is active. A forced interchange may be required (**reset pnc**).
2. Busyout the standby PNC (B-PNC).
3. Turn off the system parameter for PNC-DUP through **change system-parameters duplication**.
4. Remove the B-PNC connectivity by removing the Board Locations on the **change fiber** form for ATM-PNC.
5. Remove the B-PNC circuit packs (ATM-EI boards). Use **change circuit pack UUC**.

6. Disable administration of PNC duplication on the **change system-parameters customer-options** form by changing the PNC Duplication field to **n**.

NOTE:

Alterations to PNC that involve only the *addition* of connectivity can be done with PNC-DUP operational.

Alterations requiring the *removal* of connectivity must be done with PNC-DUP removed.

PNC-DUP must be removed and translations should be saved before making any hardware changes.

Steady State LEDs

The LEDs of PNC components in a stable duplicated system should appear as follows:

- The *active* ATM-EIs in the EPNs are functioning as Archangels. Their yellow LED flash pattern is 2 seconds on/200 ms off.
- The EPN standby EIs yellow LEDs are off.
- The PPN active EI yellow LED is on steady.
- The PPN standby EI yellow LED is off.

PNC state of health

PNC-DUP software monitors the health of the two PNCs as determined by their state of health (SOH) vectors, and initiates an interchange when the health of the active falls below that of the standby (unless prevented from doing so by a PNC lock, busyout, or antithrashing mechanism). Potentially service-disrupting faults that occur in PNC components are reported to PNC-DUP and incorporated in the state of health for the affected PNC. The SOHs of both PNCs are displayed on the **status pnc** screen, as shown in [Figure 10-14](#).

```

Figure 10-14. Status PNC screen with standby PNC fully In-Service

PNC state of health indexes

The Inter-PN Index from the state of health vector is used to track and compare the states of health of both PNCs. The fields making up the indexes are two-digit numbers separated by periods (.), with each field representing a different class of faults. The fault class fields are arranged in order of decreasing importance from left to right. In other words, each field in the index supersedes the following fields in determining which PNC is healthiest. A fault class drives an interchange only when all of the higher priority fault classes are equal. A zero entry indicates no faults present for that class. Increasing numbers indicate increasingly higher numbers of faults present in that class.

The Inter-PN Index contains 3 fields (XX.XX.XX). The Inter-PN Index reports faults in connectivity between port networks.

- The meaning of each fault class field is given in [Table 10-96](#).
- A zero entry indicates that there are no faults reported.
- Higher numbers indicate increasing number of faults.
- All zeros indicates perfect state of health.
- Unless the PNCs are locked, the active PNC's state of health should always be equal to or better than the standby's, otherwise, the system performs a spontaneous interchange.

After a PNC-related alarm is cleared, the system performs a partial refresh of the standby PNC. The corresponding fault class field is not updated to reflect the improved state of health until the refresh is done. The state of health indexes do not agree with the current alarm status during this period.

Table 10-96. PNC State of Health Fault Classes

Fault Class	Priority	Description	MOs
FC_EAL	1	Number of PNs with EALs down	EXP-PN
FC_PACL	2	Number of PNs with LINL, RINL, or EI-SNI neighbor link faults	EXP-PN
FC_HW	3	Number of PNs affected by hardware faults in a link having an EI as an endpoint. (Endpoints can be determined with list fiber-link .)	ATM-EI

Resolving poor state of health

When the SOHs for both PNCs are not all zeros (perfect health), use the following steps to identify and repair the problem.

1. Look for PNC component alarms (major or minor) for the PNC side whose SOH is not all zero. The standby PNC should be repaired first.
2. Busy-out the standby PNC.
3. Follow the appropriate diagnostic and repair procedures for the alarmed PNC components just as with a simplex PNC. Both the alarm and error logs should be examined to isolate the fault.
4. Verify that the related PNC SOH is restored to all zeros.
5. Release the standby PNC.

Refresh and unrefresh of the standby PNC

In a fully-functional PNC with healthy standby and active sides, the standby PNC has a complete set of call connections corresponding to those in the active PNC. If, however, the state of health of the standby PNC degrades, a selective unrefresh of those connections that utilize the faulted component(s) is performed. If the health of the standby PNC improves, a selective refresh of connections on the affected route is performed so that call setup is consistent between the active PNC and the healthy parts of the standby PNC.

The *Standby Refreshed?* field on the **status pnc** screen does *not* refer to the selective type of refresh. It refers only to a global refresh that is performed when:

- The system is initialized and PNC duplication is enabled.

- There has been a spontaneous PNC interchange.
- The standby PNC has been released from busy-out.
- A system reset of level 2 or higher has taken place.

The refreshed field may display yes when in fact the standby is partially unrefreshed. An interchange into an incompletely refreshed standby results in dropped calls. This can happen when a more severe fault occurs on the active PNC or when **reset pnc interchange** is used with the override option.

PNC interchanges

PNC spontaneous interchanges occur when PNC duplication software determines that the State of Health (SOH) of the standby PNC is better than that of the active PNC.

- PNC-DUP executes a spontaneous interchange in response to a message from a PNC component maintenance object indicating that either a fault has occurred on the active PNC or a fault has been resolved on the standby PNC.
- The PNC SOH is compared to the standby PNC, and an interchange occurs if the state of health of the standby PNC is now better than that of the active PNC.
- A corresponding Major or Minor alarm is logged by the reporting MO, stimulating an alarm report.

When the resolution of a fault on the standby renders it more healthy than a simultaneously-faulted active PNC, the error message indicates the type and location of the *improved* component.

Once the interchange completes, the failed component is on the standby PNC. A demand interchange can be requested in the presence or absence of standby PNC faults. The following sequence of actions can be observed during a fault-free interchange:

1. The ATM-Expansion Interfaces currently acting as archangels in the EPNs are deactivated as indicated by the yellow LEDs going from flashing to on solid.
2. The PPN ATM-EIs are interchanged, indicated by the new standby ATM-EI yellow LED off and the new active ATM-EI yellow LED on steady.
3. One by one the EPN ATM-EIs are interchanged as indicated by new standby ATM-EI yellow LED turning off and the new active ATM-EI yellow LED flashing (2 seconds on/200 milliseconds off). At this point the interchange is functionally complete.

Certain conditions may interfere with the normal execution of the interchange:

1. In a faulted spontaneous interchange, it is possible the EPN/EPNs directly affected by the fault will be the last to interchange.
2. A user directly affected by the single fault instigating a PNC interchange can experience a momentary voice path outage during the switch.
3. If faults exist on both the standby and active PNC, it is possible to have some EPNs go out of service while others are returned to service.

In any multifault situation, rely on **status pnc** to determine which is the active PNC.

PNC duplication informs Timing Synchronization maintenance when a PNC interchange has been completed and indicates which PNC is active. This causes Synchronization to audit and ensure that the primary source for synchronization of Tone-Clocks in each PN is supplied by a path associated with the active PNC.

Antithrashing and PNC interchanges

Following a spontaneous PNC interchange, subsequent PNC interchanges are prevented for 5 minutes. This condition is indicated by *y* in the *Interchange Disabled?* field of the **status pnc** screen. After 5 minutes, the antithrashing, timer expires, interchange decisions are re-enabled, and the field displays *n*. *Should a catastrophic failure occur on the active PNC during the period when the Interchange Disabled? field is set to "yes," there will be no spontaneous PNC interchange.*

Demand PNC interchanges also invoke anti-thrashing, but only for a period of 30 seconds. During antithrashing mode, demand interchanges are also prevented unless the override option is specified.

CAUTION:

Use of this option may cause a service disruption.

Repairs on the standby PNC components

CAUTION:

If there is a TDM-CLK alarm, system timing may be routed through part of the standby PNC, and circuit switched data may be affected by the following repair procedures. This can happen, for example, when a slave tone/clock circuit pack experiences a loss of signal and switches to receive timing from the standby ATM-EI. In this case TDM-CLK 2305 error is logged, and the clock problem should be addressed first, if possible.

To repair PNC components in a duplicated PNC proceed as follows:

1. Most repairs involve fixing a single fault on the standby PNC. Use **set pnc lock** or **busy-out pnc** to prevent an interchange into the PNC being repaired.
2. If a faulty component exists on the active PNC, this also means that the standby PNC is more severely faulted. Normally, the *standby* PNC is repaired first, since it is the most severely impaired.

To repair the active PNC (standby is already repaired), issue the **set pnc unlock** command, which generates a spontaneous interchange. In a PNC demand interchange with **reset pnc interchange** use the **override-and-lock** qualifier for the active PNC. The *override-and-lock* option ensures that no subsequent interchange can occur during the repair of the standby PNC. A demand interchange may not be necessary if the following conditions drive a spontaneous interchange:

- The anti-thrashing period from the last interchange has expired.
- The global refresh from releasing the standby PNC has completed.
- The standby PNC State of Health is better than the active PNC.

At this point, the faulty component is on the standby PNC, and the PNCs are locked in their current active/standby state.

3. Busyout the PNC with the **busyout pnc** command.
4. Use fault isolation and component testing procedures for the individual PNC components, just as for a simplex PNC. Replacement of components does disrupt operation of the active PNC.
5. Once the failed component is replaced, use the **status pnc** command to check the health standby PNC component.
6. When confident that the problem has been resolved, as indicated by a state of health with all zeros, unlock (**set pnc unlock**) and release (**release pnc**) the PNC. Note that no further PNC interchange is required since you can test the standby PNC as thoroughly as the active.

Interactions: SPE resets and PNC interchanges

- After a **reset system 4** (reboot), the A PNC is always the active.
- A system reset of level 1 (warm), 2 (cold2) or 3 (cold1) does not change which PNC is active. If a PNC interchange was in progress when the reset took place, the PNC interchange continued until completion.
- If a **reset system 1** (warm) takes place during a PNC interchange, the reset is escalated to level 2 (cold2).

Fault isolation using Duplicated PNC

In some cases, PNC duplication can aid in the fault isolation procedure. PNC interchanges can be used to help isolate the faulty hardware. Two examples demonstrating this technique follow:

1. There is a fault that can occur in either the PPN ATM-EI or the PKT-INT which cannot be readily attributed to one board or the other. If the packet bus transceivers on either the PKT-INT or ATM-EI fail, the two boards cannot communicate, but it will not be clear which board is at fault. In this case, a planned interchange of the PNC can be used to indicate which of the two boards.
 - If the interchange cures the problem, the ATM-EI was at fault.
 - If the interchange does not cure the problem, the PKT-INT is suspect, provided there are no PKT-BUS faults.
2. A similar relationship exists for the EPN Archangel (EAA - the active ATM-EI) and certain TDM bus problems. If the EAA is unable to communicate with a port board over the TDM bus, either the EAA has a fault, the port board has a fault, or there is a problem with the TDM bus itself. If TDM bus maintenance tests find no problems with the bus, then it is either the port board or the EAA. It may be simpler to replace the port board than to request a PNC interchange. However, if it is not clear which port board may be at fault or maintenance is being performed remotely, verify that the EAA is not at fault by executing a PNC interchange. If the interchange solves the problem, then the EAA is faulty. If the problem persists after the interchange, but TDM bus maintenance finds no problem, then the port board is faulty.

Error Log entries

Whenever a PNC interchange takes place, an error is logged against PNC-DUP with a code that conveys information about the cause of the interchange and which PNC became active. There are no alarms associated with PNC-DUP errors, but there should be an alarm against the PNC component that caused the interchange. There are no PNC-DUP test sequences, but **status pnc** provides information regarding the status of the PNCs. The information in [Table 10-97](#) and [Table 10-98](#) can help to identify which areas of the Alarm Log to investigate to find the source of the problem.

Table 10-97. Error Code descriptions and Aux Data correlations

Error Code	Description	Aux Data ¹
00000	Error in generating error code	None
1cxpp	Spontaneous Interchange in response to a constraint for A-PNC	Active PNC
2cxpp	Spontaneous Interchange in response to a constraint for B-PNC	Active PNC
51000	Spontaneous Interchange at expiration of SOH validation timer	Active PNC
52000	Spontaneous Interchange upon PNC UNLOCK	Active PNC
53000	Spontaneous Interchange at completion of Global Refresh	Active PNC
60801	PNC Demand Interchange	Active PNC
60800	PNC Demand Interchange with override	Active PNC

¹ The Aux Data indicates which PNC became active after the PNC interchange: "0" denotes PNC-A; "1" denotes PNC-B.

Table 10-98. Error Log Encode Field Decoding

Field	Variable Name	Values	Description
c	Alarm Type	0	Alarm retired
		1	MAJOR or MINOR alarm on any PNC component
x	Fault class; see description for contributing MOs	0	EAL (Expansion Archangel Link - EXP-PN) carries CCMS messages
		1	PACL (ATM-EI) carries ATM signaling commands from Call Processing to the remote ATM-EI circuit packs.
		2	PNC hardware (providing connectivity of PPN or EPN to EPN or ATM-EI)
pp	Port Network number	0-44	0-2 for constraint class (this is an internal number; add 1 for external port number)

Error Log Entries and Test to Clear Values

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
18	None	busy PNC-DUP	WARNING	ON	release pnc-dup

NOTE:

The **list config port-network** command gives the cabinet number associated with a port network.

ATM-SGRP (ATM Signaling Group)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ATM-SGRP	MINOR	test sig-group <i>grp#</i>	ATM-CES Signaling Group
ATM-SGRP	WARNING	test sig-group <i>grp#</i>	ATM-CES Signaling Group

1 *grp#* is the signaling group number (1-166); the test sequence can be either short or long.

This Maintenance Object (ATM-SGRP) applies when ATM signaling groups have been administered on an ATM circuit pack.

[Table 10-99](#) outlines the differences between ATM interface circuit packs:

Table 10-99. R7 ATM-SGR circuit packs

Circuit pack	Channel types	Interface	Fiber	Echo cancellation
TN2305	B and D channels	24 or 32 channel	Multimode	Y
TN2306	B and D channels	24 or 32 channel	Single mode	Y

The TN2305 and TN2306 ATM Interface circuit boards are referred to as TN230X for the remainder of this MO.

An ATM Signaling Group is a collection of B-channels for which a given ISDN-PRI Signaling Channel Port (ATM D-channel) carries signaling information. ATM B-channels (ATM-BCH) carry voice or data and are assigned to ISDN trunks. For more information see "[ATM-TRK \(Circuit Emulation Service Circuit Pack\)](#)".

The operation of the entire ATM signaling group depends on several other entities:

- the ATM-DCH signaling channel port
- the TN230X Interface circuit pack on which the D-channels reside
- the system link that is carried over the packet bus to the processor

When there are problems with ATM-SGRP (ATM signaling group), also investigate:

- [“ATM-DCH \(ATM D-Channel Port\)”](#)
- [“ATM-BCH \(ATM B-Channel Trunk\)”](#)
- SYS-LINK
- PKT-BUS

Error Log Entries and Test to Clear Values

Table 10-100. ATM-SGRP Signaling Group Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any		test sig-group <i>grp#</i>
1 (a)	Any	None			
18 (b)		MO busied out			
257 (c)	Any	None			test sig-group <i>grp#</i>
769 (d)	Any	Primary Signaling Link Hardware Check (#636)			test sig-group <i>grp#</i>
1281 (e)	Any	Secondary Signaling Link Hardware Check (#639)			test sig-group <i>grp#</i>
1793 (f)	Any	Layer 2 Status (Test #647)	WNG	OFF	test sig-group <i>grp#</i>
2305 (g)	Any	Remote Layer 3 Query (Test #637)	MINOR	OFF	test sig-group <i>grp#</i>
3585 (h)	Port number	None			
3840 - 3928 (i)	Port number	None			

Notes:

- a. Error Type 1: switch sent a message to the far-end switch or terminal adapter, and the far-end did not respond in the allotted time. Possible causes include link failure and congestion or outage at the far-end. The Aux Data field contains Layer 3 protocol information used by internal counters.

If no other symptoms are present, no action is required. If Layer 3 communication is down:

- a. Check for alarms and errors against link components

- b. Check out other errors against ATM-SGRP, ATM-TRK, and other hardware components on the link.

There is no test to clear these errors. The error counter is decremented by 1 every 15 minutes.

- b. Error Type 18: the ATM circuit pack has been busied out (either **busyout atm sig-grp** or **busyout board UUCSS**).
 1. Release the ATM signaling group (**release atm sig-grp**) or the circuit pack (**release board UUCSS**).
- c. Error Type 257: the primary signaling channel connection has been lost for more than 90 seconds.
 - The associated B-channels are placed in the ISDN Maintenance/Far-End state.
 - The B-channels are not usable for outgoing calls, although incoming calls can be accepted.
 - The switch automatically attempts to recover the signaling link.
 - 1. Pay particular attention to the results of Test #636 (Primary Signaling Link Hardware Check) in the test sequence.
 - When the link does recover, the B-channels are negotiated back to the In-Service state and their alarms are retired.
 - 2. When this error occurs, the state of the Signaling Group is changed to out-of-service (verify using the **status sig-group** command).
- d. Error Type 769: signaling link hardware error.

Service-affecting failures of the hardware used to transport the D-Channel are reported to the ATM CES Signaling Group MO. Maintenance logs this error, places the D-Channel into the OOS state, and raises a board-level alarm. The D-Channel is returned to service and the alarm is retired once the hardware failure condition clears.
- e. Error Type 1281: Degraded PVC Alarms indicate that a particular Permanent Virtual Circuit, or signaling group, has encountered sufficient errors to exceed firmware thresholds. Operations can continue but at a lower level of reliability or performance. Firmware filters these alarms so that only one is reported active at a given time. The following in-line error is considered a Degraded PVC Alarm:
 - Excessive AAL - The AAL layer is experiencing an excessive number of errors in trying to reconstruct Service Data Unit (SDUs). Possible causes:
 - Something may be wrong with the ATM switch.
 - The communication paths on the other side of the ATM switch may be noisy.
 - The sending node might not be healthy.
 - Could be a problem with congestion on the ATM switch.

- f. Error Type 1793: failure of the Layer 2 Query Test for the primary signaling channel.
- Excessive AAL - The AAL layer is experiencing an excessive number of errors in trying to reconstruct Service Data Unit (SDUs). Possible causes:
 - Something may be wrong with the ATM switch.
 - The communication paths on the other side of the ATM switch may be noisy.
 - The sending node might not be healthy. It could also be a problem with congestion on the ATM switch.
- g. Error Type 2305: the Remote Layer 3 Query Test (#637) failed. A specific message was sent to the far-end switch, and it did not respond within the allotted time.
1. Investigate elements of the ATM D-channel(s) (ATM-DCH) for both this switch and the Far-end switch.

If Test #637 fails twice in a row, the B-channels are alarmed and made unavailable for outgoing calls (although incoming calls are still accepted). When Test #637 succeeds and the Far-end switch starts responding properly, the ATM Trunk (B-channels) are placed back into normal operation and their alarms retired.

- h. Error Type 3585: A SERV or SERV ACK ISDN D-channel message has been received by a non-US-type interface (country option other than 1 on the DS1 administration form). However, these messages are used only for duplex NFAS signaling, which is supported by country protocol 1.
- Thus, there may be a mismatch in administration between the local and far-end switches.
1. Consult with the customer's network provider to determine whether the D-channel is set up correctly on the far-end switch.

- i. Error Type 3840-3928: These error types are used to report certain error messages received by the ATM-SGRP Signaling Group for one of its associated B-channels. The Aux Data field is the port number of the B-channel from which the message was received.

The error code generated equals 3840+x, where x is a Cause Value defined by the ISDN PRI Specification. Note that there is no Test to Clear Value for these error types; selected ISDN cause values are placed in the log when they are received, but no direct action or alarming is performed solely in response to receiving them. They provide added data that may prove useful when tracking down obscure networking and routing problems. [Table 10-101](#) provides more information about this range of Error Codes:

Table 10-101. Descriptions and repair recommendations (Error Types 3840-3928)

Error Code	Description	Recommendation
3842	A request has been made to use a transit network or common carrier that cannot be accessed.	From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. <ol style="list-style-type: none"> 1. Check all routing patterns containing this trunk group for validity of interexchange carriers requested (IXC field).
3846	The far-end switch has indicated that the B-channel (trunk) is not acceptable for use in the call for which it was requested.	This could indicate <ul style="list-style-type: none"> ■ an administration problem (for example, the local switch and the far-end switch have different B-channels administered) ■ a normal race condition (for example, the local switch has requested use of a B-channel which the far-end switch had just reserved for use on another call). <ol style="list-style-type: none"> 1. From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. 2. Issue the status trunk command for the indicated trunk. 3. Refer to Table 10-60 in "ATM-BCH (ATM B-Channel Trunk)" for recovery suggestions.
3858	Similar to Error Type 1. The switch sent an ISDN message to the far-end switch or terminal adapter which did not respond in the allotted time.	<ol style="list-style-type: none"> 1. Check for alarms and errors against link components 2. Check out other errors against "ATM-SGRP (ATM Signaling Group)", "ATM-TRK (Circuit Emulation Service Circuit Pack)", and other hardware components on the link.
3878	The far-end switch has indicated that the network is not functioning correctly and that the condition may last a relatively long period of time (for example, immediately re-attempting the call may not be successful).	<ol style="list-style-type: none"> 1. From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. 2. Consult with the network provider to determine the nature and expected duration of the out of service condition. 3. Consider modifying all routing patterns containing this trunk group, to route calls around the network which is out of service.

Table 10-101. Descriptions and repair recommendations (Error Types 3840-3928) — Continued

Error Code	Description	Recommendation
3890	<p>A request to use a network service (for example, SDN) has been denied. Administration somewhere on the network has indicated that the requested service has not been subscribed to or purchased for this trunk.</p>	<p>This could indicate</p> <ul style="list-style-type: none"> ■ a local administration problem ■ a mismatch between the local administration and that of the network provider. <ol style="list-style-type: none"> 1. From the circuit pack and port number (in the Aux Data field), determine the trunk group against which the error was reported. 2. Display the trunk group form. <p>If the trunk group is Call-by-Call (the <i>Service Type</i> field is <i>cbc</i>), check all routing pattern forms containing this trunk group to see if the <i>Service/Feature</i> fields contain the correct network services purchased for this trunk.</p> <p>If the trunk group is not Call-by-Call, check that the <i>Service Type</i> field contains the single network service purchased for this trunk.</p> 3. If local administration appears correct, consult with the customer and/or the network provider to determine the services that the customer has subscribed to for this trunk group.
3892	<p>Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.</p>	<ol style="list-style-type: none"> 1. If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3894	<p>Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.</p>	<ol style="list-style-type: none"> 1. Eliminate any transitory state mismatch problems (test port UUCSSpp for the trunk port shown in the Aux Data field). Test #256 (Service State Audit) is the important test in the sequence. 2. If Test #256 passes yet the customer continues to complain of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.
3905	<p>Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.</p>	<ol style="list-style-type: none"> 1. If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate the problem and provide the next tier with this Error Log information.

Continued on next page

Table 10-101. Descriptions and repair recommendations (Error Types 3840-3928) — Continued

Error Code	Description	Recommendation
3906	Protocol detail; may offer a clue if customer is having ISDN calls denied with an unexpected intercept tone.	1. If customer is complaining of unexpected intercept tones when accessing ISDN trunks or PRI endpoints and no other cause can be found, escalate to the problem and provide the next tier with this Error Log information.
3909	A request to use a network service has been made, but the network has rejected the request because the requested service is not implemented.	1. Follow the recommendations listed above for Error Type 3890.
3928	A call was denied because of a basic incompatibility between the type of call and either the facilities selected by the routing pattern or the called user itself.	This error might be helpful as a clue if the customer complains of receiving unexpected intercept tone after accessing ISDN trunks or PRI endpoints. <ol style="list-style-type: none"> 1. Determine the trunk group from the circuit pack and port number (in the aux data field) 2. check the BCC fields of the pertinent routing patterns. 3. Also, investigate whether or not the calling and called endpoints are compatible (for example, some ISDN switches may not allow a voice station to call a data extension).

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the Primary Signaling Link Hardware Check, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-102. System Technician-Demanded Tests: ATM-SGRP

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Primary Signaling Link Hardware Check (#636)	X	X	ND
Layer 2 Status Test (#647)	X	X	ND
Remote Layer 3 Query Test (#1291)	X	X	ND

¹ D = Destructive, ND = Non-destructive

Primary Signaling Link Hardware Check (#636)

The ATM-SGRP Signaling Group D-Channel port depends on the health of the TN230X interface circuit pack on which it resides. This test fails if there are problems with either the ATM-DCH (D-channel port) maintenance object or the TN230X circuit pack. Investigate the ATM TN230X circuit pack (ATM-TRK) anytime there are problems with the ATM D-channel port (ATM-DCH).

Table 10-103. Primary Signaling Link Hardware Check (#636)

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error Retry the command at 1-minute intervals a maximum of 5 times.
8	FAIL	There is a problem with the ATM TN230X Circuit Pack or the ATM Signaling Channel (D-Channel), preventing any ISDN trunk calls until the problem is resolved. 1. Consult the procedures for the TN230X Circuit Pack (ATM-TRK) and the ATM D-channel (ATM-DCH).
	PASS	The basic physical connectivity of the D-channel is intact and functional. 1. Try this test repeatedly to ensure the link is up and to uncover any transitory problems.

Layer 2 Status Test (#647)

The Layer 2 Status Test checks the layer 2 status of the ATM-SRG Signaling Channel (D-channel). This test fails when:

- there is a hardware failure
- there is a facility problem
- the D-channels are not administered correctly

The Signaling Link Hardware Check (Test #637) and the Remote Layer 3 Query Test (#1291) detects most problems caused by hardware failures or incorrect administration.

Table 10-104. TEST #647 Layer 2 Status Query Test

Error Code	Test Result	Description/ Recommendation
1132	ABORT	Internal system error. The port location for the D-channel is not known. This condition should not be possible since an administered ATM circuit pack must be specified when a Signaling Group is administered: 1. Retry the command at one minute intervals a maximum of five times.
1134	ABORT	Internal system error. The associated ATM circuit pack is not administered. This condition should not be possible, since an administered ATM circuit pack must be specified when administering a Signaling Group. 1. Retry the command at one minute intervals a maximum of three times.
2500	ABORT	Internal system error 1. Retry the command at one minute intervals a maximum of five times.
1	FAIL	Layer 2 of the signaling channel is down 1. Examine the results of the Signaling Test (#636) and follow recommendations provided there. 2. If Test #636 (Primary Signaling Link Hardware Check) passes, the Layer 2 Query test may still fail if the Signaling Channel at the far end has not been administered correctly or if the Signaling Channel has been busied out. 3. Verify that the Signaling Channel (D-channel) at the far end has been administered correctly. 4. Verify that the ATM-DCH port used for the D-channel has not been busied out at the far end.

Table 10-104. TEST #647 Layer 2 Status Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
3	FAIL	The D-Channel is down. <ol style="list-style-type: none">1. Examine the results of the Primary Signaling Link Hardware Check (#636) and follow recommendations provided there.2. If Test #636 (Primary Signaling Link Hardware Check) passes, the Layer 2 Query test may still fail if the Signaling Channel at the far end has not been administered correctly or if the Signaling Channel has been busied out.3. Verify that the Signaling Channel (D-channel) at the far end has been administered correctly.4. Verify that the ATM-DCH port used for the Primary and Secondary D-channels has not been busied out at the far end.
	PASS	The Primary Signaling Channel is up.

Remote Layer 3 Query (#1291)

This test queries the far-end switch or terminal adapter to determine if the signaling connection is functioning properly at Layer 3. It selects a B-channel in the in-service or maintenance service state and sends an ISDN Layer 3 SERVICE message, which requires a response from the far end (similar to performing Test #256 on an ISDN trunk). The test is not performed if there are no B-channels in an appropriate ISDN service state (for example, when none are administered or they are all out of service).

NOTE:

The service state can be displayed by using the **status trunk <trunk group/trunk member>** or **status pri-endpoint** command.

As is the case with Test #256 for an ISDN trunk, a PASS only indicates that a message was composed and sent to the far-end switch or terminal adapter. The ISDN PRI Specification allows up to 2 minutes for a response. Check the Error Log for ATM-SGRP errors of type 2305 for evidence of a Remote Layer 3 Query failure.

Test #636 checks the health of the D-channels and ATM Interface Circuit Packs. This test goes one step further by checking the communication path from the processor, through the TDM/Packet Bus and ATM Interface circuit pack, and on to the far-end switch or terminal adapter. A special ISDN message is sent to the far-end switch or terminal adapter, which must respond within a specified amount of time. This test is designed to ensure that the communication path between the

switch and the far-end is up and operational, and that the two endpoints can properly exchange ISDN control messages.

Table 10-105. TEST #1291 Remote Layer 3 Query

Error Code	Test Result	Description/ Recommendation
1006	ABORT	There are no associated B-channels in an ISDN "in-service" or "maintenance" service state. This is a NORMAL ABORT. <ol style="list-style-type: none"> 1. Administer or release an ISDN trunk or PRI endpoint before retrying the test. For an ATM trunk, use the status trunk grp#/mbr# command to verify the ISDN trunk state. 2. Retry this test when at least one B-channel is in the "in-service" or "maintenance" states.
1113	ABORT	The signaling channel is down. Therefore, no messages can be sent to the far-end switch or terminal adapter. <ol style="list-style-type: none"> 1. Examine the results of Tests #636 and follow recommendations provided there.
2100	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500 or none	ABORT	Internal system error or administration problem <ol style="list-style-type: none"> 1. Determine if any B-channels are administered. 2. If there are none, then this is a normal ABORT, since this test cannot run unless at least one B-channel is administered. 3. If at least one B-channels is administered, there is an internal system error. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Internal system error <ol style="list-style-type: none"> 1. See description of ABORT with Error Code 2500.
	PASS	A message was sent to the far-end switch or terminal adapter. The ISDN PRI specification allows up to 2 minutes for a reply. <ol style="list-style-type: none"> 1. Check the Error Log for ATM-SGRP errors of type 2305 for evidence of a Remote Layer 3 Query failure. 2. If no new errors were logged since this test was run, then this switch and the far-end switch can exchange call control messages. 3. If there is still a problem with a particular ATM trunk, busyout the trunk and run the long test sequence, paying particular attention to the results of Test #258 (ISDN Test Call).

ATM-SYNC (ATM Synchronization)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
ATM-SYNC	MINOR	display errors	ATM Synchronization
ATM-SYNC	WARNING	test synchronization	ATM Synchronization

This section discusses intra-switch synchronization maintenance and the hardware and software components that provide a common reference frequency for reliable digital communication among the G3r system, the ATM switch, and other PBXs, Central Offices (COs) or Customer-Premises Equipment (CPE). Circuit packs involved in synchronization include:

- TN768, TN780, or TN2182 Tone/Clock
- TN722, TN767, and TN464 DS1 Interfaces (all suffixes)
- TN2305/6 (R7.1) and TN2238 (R6.3) ATM Expansion Interface (multimode fiber)

Synchronization is achieved between the Processor Port Network (PPN) and the Expansion Port Networks (EPNs) through the ATM port network connectivity (ATM PNC) between the networks. Depending on the network synchronization plan and the status of synchronization sources, the system timing reference may be:

- The clock circuit pack on the ATM switch
- A DS1 or UDS1 interface circuit pack-tapped T1 input signal connected to the ATM switch clock circuit
- An OC-3 interface circuit pack on the ATM switch

Stratum 4 synchronization extracts timing information directly from

- A DS1 or UDS1 reference
- An OC3 reference
- The ATM switch clock

For further information about synchronization including network synchronization, see *AT&T Network and Data Connectivity*.

Stratum 4 Synchronization

Systems may have primary and secondary synchronization references (DS1/UDS1 interface circuit packs or ATM-Switch) when using Stratum 4 synchronization.

If the primary synchronization reference in [Figure 10-15](#) is providing a valid timing signal, then the flow of system synchronization would travel from the DS1 interface circuit pack in the EPN to the ATM switch. The primary DS1 interface

circuit pack provides a timing signal for the ATM switch clock circuitry. This synchronization source is then distributed to all of its OC3 Interface Modules. Each ATM Expansion Interface circuit pack uses the received data stream from the ATM switch to generate a timing signal. The Tone-Clock circuit packs in the EPNs use this signal to generate timing for all the circuit packs in their respective EPNs. All PNs, in the above mentioned scenario are designated the *slave* port networks. The ATM switch is the *master* that contains the system synchronization source. If the primary synchronization reference does not provide a valid timing signal, ATM synchronization maintenance infers a switch to the secondary reference.

If the primary synchronization reference is not providing a valid timing signal, the system automatically switches to the secondary synchronization reference. If the primary synchronization reference is invalid, and if the secondary reference does not provide a valid timing signal or is not administered as a synchronization reference, the switch infers that the local oscillator of the ATM switch provides the system timing source. If the system is using the local oscillator of the ATM switch as the system timing source because the primary and secondary references are providing invalid timing signals, when either the primary or secondary reference becomes valid again, the system switches back to the primary or secondary source. When both the primary and secondary source become valid, the system switches to the primary source, since the primary source is always preferred over the secondary source when both sources are equally healthy.

[Figure 10-15](#) depicts a simplex ATM PNC with T1/OC3 synchronization reference into the ATM switch.

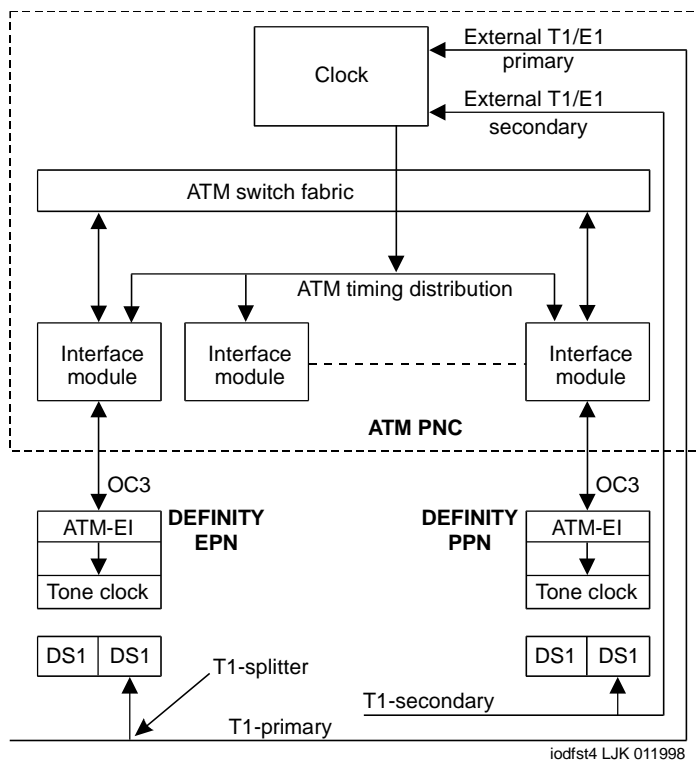

Figure 10-15. Stratum 4 synchronization with simplex ATM PNC

NOTE:

The TN722 DS1 Interface circuit pack does not provide a synchronization reference as reliably as the TN767 or TN464C circuit packs. Therefore, administer the TN767 or TN464C circuit packs as the primary or secondary sources.

Stratum 3 Synchronization

Stratum 3 synchronization is not supported in DEFINITY with ATM PNC.

Synchronization troubleshooting

A significant part of the Synchronization Recovery Strategy for a DEFINITY with ATM PNC resides in the ATM switch's clock hardware, firmware, and software. DEFINITY monitors synchronization performance and alarms faulty components within DEFINITY.

ATM-SYNC commands

Use the following commands to help troubleshoot ATM-SYNC problems:

change synchronization	Allows primary and secondary references to be administered for the Stratum 4 option, or <code>ATM-Switch</code> , indicating that the synchronization references are input directly to the ATM switch
status synchronization	Shows the current inferred synchronization reference
status synchronization	Shows the administered primary and secondary synchronization references
list timing-source	Displays all DS1 and UDS1 locations that are allowed to be administered as primary or secondary references with the change synchronization command
disable/enable synchronization-switch	Prevents or allows switching to another synchronization source
test synchronization	Tests the administered synchronization source

Error Log Entries and Test to Clear Values

Table 10-106. Synchronization Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test synchronization
1 (a) (g)		None	WARNING/ MINOR	OFF	None
257 (b) (g)		None	WARNING/ MINOR	OFF	None
513 (c) (g)		None	WARNING/ MAJOR	OFF	None
1537 (d) ²		None	WARNING	OFF	None
1793 (e) ²	0-50	None	NONE	OFF	None
2049 (f) ²	0	None	WARNING	OFF	None

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 It may take up to 1 hour for these alarms to clear via the "leaky bucket" strategy.

Notes:

- a. Error Type 1: problem with the primary DS1 reference. It is cleared when the primary reference is restored. The following steps should give an indication of the source of the problem:
 1. Check if the primary DS1 interface circuit pack is inserted in the carrier with the **list configuration board UUCSS** command.
 2. Verify that the administered primary reference matches the DS1 reference from the network synchronization plan.
 3. Test the primary DS1 interface circuit pack with the **test board UUCSS long** command. Check the Error Log for DS1-BD or UDS1-BD errors and refer to the DS1-BD or UDS1-BD (DS1 Interface Circuit Pack or UDS1 Interface Circuit Pack) Maintenance documentation to resolve any errors associated with the primary DS1 (DS1 or UDS1) interface circuit pack. If the only errors against DS1-BD or UDS1-BD are slip errors, then follow the procedures described in the troubleshooting section above. If no errors are listed in the Error Log for the primary DS1 interface circuit pack, continue with the following steps.
 4. Test the active Tone-Clock circuit pack in the master port network with the **test tone-clock UUC long** command. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM Bus Clock Circuit Status Inquiry Test) passes successfully. If Test #148 fails with an Error Code 2 through 32, refer to the TDM-CLK (TDM Bus Clock) Maintenance documentation to resolve the problem.
- b. Error Type 257: problem with the secondary DS1 reference. It is cleared when the secondary reference is restored. Refer to note (a) to resolve this error substituting **secondary** for **primary** in the preceding resolution steps.
- c. Error Type 513: the ATM switch clock is inferred to be providing the timing source for the system. The primary and secondary (if administered) are not providing a valid timing signal. Investigate errors 1 and 257 to resolve this error.
- d. Error Type 1537: over half of the DS1s that are administered with slip detection enabled through the `Slip Detection?` field set to **y** are experiencing slips.
- e. Error Type 1793: inferred excessive switching of system synchronization references has occurred. When this error occurs, it is inferred that the ATM switch clock has become the synchronization reference for the system.
 1. Check for timing loops and resolve any loops that exist.
 2. Test the active Tone-Clock circuit pack in the master port network with the **test tone-clock UUC long** command. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM

Bus Clock Circuit Status Inquiry test) passes successfully. If Test #148 fails with an Error Code 2 through 32, refer to TDM-CLK to resolve the problem. If not, continue with the following steps.

3. For *Duplicated Tone-Clock circuit packs in the master port network*: Switch Tone-Clock circuit packs on the master port network with the **set tone-clock UUC** command.

For Simplex Tone-Clock circuit packs in the master port network: replace the primary and secondary (if administered) DS1 Interface circuit packs.

4. Investigate any other SYNC errors.
- f. Error Type 2049: the ATM Expansion Interface circuit packs are errors that affect synchronization. Test the ATM Expansion Interface circuit pack with the **test board UUCSS** command.

This error is cleared by a “leaky bucket” strategy and takes up to one hour to clear (leak away) the error counter once it is cleared.

- g. Error Types 1, 257, and 513: noise on the DS1 line can cause transient alarms on synchronization. Therefore, when a synchronization problem occurs on Error Types 1, 257, or 513, a WARNING alarm is first raised for 15 to 20 minutes before the alarm is upgraded to a MINOR or MAJOR alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented below when inspecting errors in the system.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Test Synchronization Test (#417)	X	X	ND

¹ D = Destructive, ND = Non-destructive

Test Synchronization Test (#417)

This test updates all the Synchronization Maintenance component circuit packs with the correct information regarding their role in providing synchronization for the system. All the Tone-Clock, ATM Expansion Interface, DS1 Interface, and UDS1 Interface circuit packs in the system are updated through this test. This test either passes or aborts.

Table 10-107. TEST #417 Test Synchronization Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 3 times.
1115	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error
	PASS	The synchronization maintenance component circuit pack parameters have been successfully updated. The system should be synchronized after successful execution of this test. 1. If synchronization problems still exist, refer to the Error Log to obtain information regarding the source of the problem.

Session Restart Test (#1287)

This test is destructive.

This test attempts to restart those sessions that are down on the PPP link. The test runs only on demand as a part of **test port UUCSSpp long** command.

Table 10-108. TEST #1287 Session Restart Test

Error Code	Test Result	Description/ Recommendation
1125	ABORT	PPP Link is not in service. 1. Check if the PPP link is in-service or not. If the link is not in service, release the link (release link n or the release port UUCSSpp) and repeat the test. This is a normal abort.
2000	ABORT	Response to the test was not received from the C-LAN circuit pack within the allowable time period. 1. If this result occurs repeatedly, attempt to reset the circuit pack if the other ports on the board are not in use (Yellow LED is off). Reset the circuit pack by issuing the busyout board UUCSS and the reset board UUCSS commands. 2. If this result occurs again, replace the circuit pack.
2100	ABORT	The necessary system resources to execute the test could not be allocated. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-108. TEST #1287 Session Restart Test — Continued

Error Code	Test Result	Description/ Recommendation
2500	ABORT	Internal system Error. 1. Retry the command at 1-minute intervals a maximum of 3 times
	FAIL	All sessions on PPP link are down. 1. Test the port (test port UUCSSpp long) and verify the result of the SCOTCH Synchronous Local Loop Around Test (#1275). 2. If the test fails, escalate the problem. 3. If the test passes wait for the sessions to come up.
	PASS	All sessions on PPP link are up.

PPP Link Status Inquiry Test (#1279)

This non-destructive test determines the state of the PPP link. If the link is connected, this test passes. The test fails if the PPP link is disconnected.

Table 10-109. TEST #1279 PPP Link Status Inquiry Test

Error Code	Test Result	Description/ Recommendation
1125	ABORT	PPP Link is not in service. 1. Check if the PPP link is in-service or not. If the link is not in service, release the link (release link n or release port UUCSSpp) and repeat the test. This is a normal abort.
2100	ABORT	The necessary system resources to execute the test could not be allocated. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500	ABORT	Internal system Error. 1. Retry the command at 1-minute intervals a maximum of 3 times
	FAIL	PPP link is down. 1. Test the port (test port UUCSSpp long) and verify the result of the SCOTCH Synchronous Local Loop Around Test (#1275). 2. If the test passes wait for the link to come up.
	PASS	PPP link is up.

ATM-TRK (Circuit Emulation Service Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
ATM-TRK	MAJOR	test board UUCSS	ATM TRUNK (ATM Circuit Emulation Service)
ATM-TRK	MINOR	test board UUCSS	ATM TRUNK (ATM Circuit Emulation Service)
ATM-TRK	WARNING	test board UUCSS	ATM TRUNK (ATM Circuit Emulation Service)

- 1 UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).

This maintenance object explains how you test and repair TN230x ATM Interface circuit packs (TN2305 and TN2306) that have been administered as virtual ISDN-PRI trunks for ATM Circuit Emulation Service (CES). The maintenance instructions for TN230x circuit packs that have been administered as Expansion Interfaces for WAN connectivity are in the [“ATM-EI \(Expansion Interface Circuit Pack\)”](#) maintenance object.

Description

The TN2305 and TN2306 ([Table 10-110](#)) are dual-purpose ATM circuit packs that can be administered as:

- [“ATM Circuit Emulation Service”](#) or virtual ISDN-PRI signaling trunks. As a trunk board, it supports direct connection between ATM CES circuit packs without an intervening ATM switch.
- Expansion Interfaces (ATM-EI) for Port Network Connectivity (ATM-PNC) between the PPN and the EPNs.

Either circuit pack “personality” requires SONET OC-3 or SDH STM-1 fiber cable connections between the circuit pack and the ATM switch.

Table 10-110. R7 ATM-TRK circuit packs

Circuit pack	Channel types	Interface	Fiber	Echo cancellation
TN2305	B and D channels	24 or 32 channel	Multi mode	Y
TN2306	B and D channels	24 or 32 channel	Single mode	Y

⇒ NOTE:

TN230x circuit packs are not interchangeable.

ATM Circuit Emulation Service

Under ATM Circuit Emulation Service (CES), you simulate ISDN-PRI circuits by assigning ports to *signaling groups*. Each signaling group represents a PRI circuit, and the ports in the group represent the D-channel and B-channels of that circuit. TN230x circuit packs support up to 248 ports per circuit pack.

Virtual D-channels. Non-facility associated signaling is not supported under ATM-CES, so you must reserve one port in each signaling group for use as a D-channel (channel 24 when emulating a T-1 ISDN facility, channel 16 when emulating an E-1 facility). The D-channel can be any port from 9 to 32.

Virtual circuits. The TN230x can support a varied number of virtual circuits, depending on the switch and the administration of the circuit pack. [Table 10-111](#) lists the possibilities for various G3V4 models.

Table 10-111. Circuit and channel capacities, for each DEFINITY model

Model	Ports	Emulated circuits (signaling groups)	Channels/circuit	Virtual D-channels	Virtual B-channels
R6csi	248	1 to 8	24 (T1), 31 (E1)	1-8	6-240
R6si	248	1 to 8	24 (T1), 31 (E1)	1-8	6-240
R6r	248	1 to 8	24 (T1), 31 (E1)	1-8	6-240

Virtual trunk groups. You cannot bundle physical ISDN-PRI circuits and virtual ATM-CES circuits into the same trunk groups. Virtual circuits can only be assigned to all-virtual, all-ATM trunk groups. [Table 10-112](#) lists the possible trunk-group capacities.

Table 10-112. ATM CES capacities by DEFINITY model

Model	Ports per trunk group (max)	Trunk groups per switch (max)	Trunks per switch (max)
R6csi	99	99	400
R6si	99	99	400
R6r	255	666	400

[Table 10-113](#) shows the ATM CES capacities for both T1 and E1 circuits.

Table 10-113. Ports available for trunking, for each ISDN facility type

Type	Channels per signaling group (trunk)	Max. signaling groups (trunks) per circuit pack	Max. available ports	Reserved ports	Total ports
T1:	24	8	192	ports 1-8	256
E1:	31	8	248	ports 1-8	256

LEDs

The ATM circuit pack LEDs give you a visual indication of the condition of the TN230x circuit pack ([Table 10-114](#)).

Table 10-114. ATM-TRK LED interpretation

LEDs	Condition	LED status
Red	Error (alarm logged)	On
Red and Green	Booting (LEDs being tested)	Blinking (on 200 ms, off 200 ms)
Green	Test/maintenance in progress	On
Yellow	Fiber Loss of Signal (LOS), LOF, MS_RDI, MS_AIS, LCD, HP_RDI, HP_AIS, LOP, PSC	Blinking fast (100 ms on, 100 ms off)
Yellow	Signal to ATM switch down	Blinking slowly (500 ms on, 500 ms off)
Yellow	One or more CES signaling groups administered	On
Yellow	CES signaling group not administered or not reporting to firmware	Off

ATM-TRK-related commands

[Table 10-115](#) lists some commands that can be useful in troubleshooting ATM errors and alarms.

Table 10-115. ATM CES troubleshooting commands

Command	Description
display circuit-packs cabinet	Displays the circuit packs in the cabinet, identifying ATM Trunk as well as ATM PNC EI boards. "ATM Interface" boards have not been administered as CES or PNC.
display atm ports UUCSSppp	Displays the 256 ports on the ATM board with the corresponding signaling and trunk group.
list configuration atm	Lists the ATM boards, identifying equipment location, board code, type, and vintage.
list configuration trunks	Lists boards identifying assigned ports. While the ATM board is listed, the 256 ports are not.

Continued on next page

Table 10-115. ATM CES troubleshooting commands — Continued

Command	Description
busyout/release atm signaling-group	Busyout or release of an ATM signaling group within a trunk group.
status atm signaling-group	Show current status of an ATM signaling group.
status trunk-group	Shows status of the trunk group (ATM signaling groups are part of trunk groups).

Notes:

- a. Error Type 1: the ATM-TRK circuit pack does not appear to be in its assigned slot.
 1. Make sure that the ATM-TRK circuit pack is installed correctly seated in the slot administered for the ATM trunk.
- b. Error Type 18: the ATM circuit pack is busied out.
 1. Run **release board UUCSS**.
- c. Error Type 23: an ATM trunk is administered, but the corresponding ATM-TRK circuit pack does not appear to be physically installed.
 1. Make sure the ATM-TRK circuit pack is installed and correctly seated in the slot.
- d. Error Type 125: an ATM trunk is administered but a non-ATM-TRK circuit pack is installed in the corresponding slot. You have two options:
 - Replace the incorrect circuit pack with an ATM-TRK circuit pack.
 - Or re-administer the slot for the circuit pack that is physically present, locate the slot where the ATM-TRK circuit pack is actually installed, and re-administer the ATM trunk.

- e. Error Type 257: Control Channel Loop Test #52 failed. The circuit pack is not properly connected with the control channel on the TDM bus.
 - 1. Take the corrective action specified by Test #52.
- f. Error Type 513: ATM Crosstalk Test (#1298) failed. The board is writing to or reading from a TDM time slot that is not allocated to the board, or the Digital Signal Processor (DSP) selected for this test has malfunctioned.
 - 1. Run **test board UUCSS**.
 - 2. Take the corrective action specified for Test #1298.
- g. Error Type 769, 770: the ATM switch is requesting too many LAPD retransmissions (off-board ATM cell corruption errors).

Error Type	Aux Data	Description
769	35	LAPD excessive retransmission requests
770	25	ATM uncorrectable cell headers - threshold

- 1. Check the connections between the fiber cable, the ATM-TRK circuit pack, and the ATM switch.
- 2. See PKT-BUS for test and corrective procedures (Aux Data 35 only).
- 3. Determine what type of fiber is installed between the ATM-TRK circuit pack and the ATM switch.

If	Then
There is multimode fiber	Check the length of the fiber. If the cable is longer than 2 km, it is probably causing the errors.
There is single-mode fiber or the length of the multimode fiber is less than 2 km	The source of the errors may lie in the ATM facility, the ATM-TRK circuit pack, or the far-end circuit pack.

- 4. Perform ATM loopback tests on the near-end ATM-TRK circuit pack and on the far-end circuit pack or ATM switch.

If	Then
The ATM-TRK circuit pack fails the loopback test.	The problem is in the ATM-TRK circuit pack. Replace the circuit pack.
The far-end circuit pack or ATM switch fails the loopback test.	The problem is in the far-end circuit pack or ATM switch. Consult the circuit-pack or ATM switch documentation for advice.
The equipment at each end of the ATM span passes the loopback test	The problem is somewhere in the ATM span. Lack of bandwidth may be forcing an intermediate ATM switch to drop cells.

5. Check capacity and peak bandwidth consumption for the ATM span.

If	Then
The capacity of the span is inadequate or bandwidth consumption is too high.	Reduce traffic on the G3V4 switch to ensure that it is using no more than its subscribed bandwidth.

- h. Error Type 771: the ATM switch is sending cells with unknown Virtual Path-Identifier (VPI) and Virtual Channel-Identifier (VCI) addresses.
 1. Make sure that the ATM-TRK circuit-pack address is administered identically on the ATM switch and the DEFINITY ECS.
- i. Error Type 1281: Board major signals error (loss of high-level signal). The far-end has detected a major problem in transmissions originating from the ATM-TRK circuit pack. The possible Aux Data values for this software counter are listed in [Table 10-117](#).

Table 10-117. Error type 1281 Aux Data and repair procedures

Aux Data	Alarm Description	Repair procedure
15	SYSCLOCK failed	The board is not locked to the TDM backplane clock signal. This is probably due to a Tone Clock problem. <ol style="list-style-type: none"> 1. Check for TDM-BUS or TONE-BD errors in the Error Log. 2. If no other problems are present, reset the circuit pack (reset board UUCSS)

Continued on next page

Table 10-117. Error type 1281 Aux Data and repair procedures — *Continued*

Aux Data	Alarm Description	Repair procedure
16	Loss of Signal: LOS	<p>The fiber is not connected properly to the ATM-TRK board or ATM switch (or to the multiplexer section [MUX] if present). It is possible that the board transceivers are not functioning properly.</p> <ol style="list-style-type: none"> 1. Run test board UUCSS command. 2. If Test #1259 fails with Error Code 16, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the yellow LED flash goes away. If it does the problem is off-board. 3. If the yellow LED continues to flash, replace the circuit pack.
17	Loss of Frame: LOF	<p>The fiber signal cannot obtain or maintain STM-1/OC-3 framing.</p> <ol style="list-style-type: none"> 1. Try to move the fiber on the ATM switch side to a different port. 2. If the problem persists, reset the circuit pack (reset board UUCSS).
18	Multiplexer Section Alarm Indication Signal: MS_AIS	<p>There is a major problem on the far end (between multiplexer section [MUX] and the switch) that prohibits the circuit pack from sending a valid signal.</p> <ol style="list-style-type: none"> 1. See if the ports at the MUX and/or the ATM switch are connected snugly. 2. Run test board UUCSS command 3. If Test #1259 fails with Error Code 18, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the yellow LED flash goes away. 4. If it does the problem is off-board. 5. If the yellow LED continues to flash, replace the circuit pack; if the error persists, escalate the problem.

Table 10-117. Error type 1281 Aux Data and repair procedures — Continued

Aux Data	Alarm Description	Repair procedure
23	High-level path Remote defect Indicator: HP_RDI	The far-end is detecting a major problem with the signal that this board is transmitting. The transmitted payload is invalid. <ol style="list-style-type: none"> 1. Make sure the ATM switch port (or a MUX port, if present between ATM switch and the ATM-TRK board) is the same as the ATM-TRK circuit pack's cable interface. 2. Run test board UUCSS command; if the Test #1259 fails with Error Code 23, connect a fiber back-to-back in a looped mode (one strand of fiber connecting the transmit transceiver to the receive transceiver of the board) and see if the yellow LED flash goes away. 3. If it does the problem is off-board. 4. If the yellow LED continues to flash, replace the circuit pack.
24	Loss of cell delineation (LCD)	On board ATM framer chip is not able to frame cells based on the cell header. <ol style="list-style-type: none"> 1. Reset the board (reset board UUCSS). 2. If the error persists, replace the board.
27	SIGCON_DOWN ATM switch high level signal.	The board cannot communicate with the ATM switch. <ol style="list-style-type: none"> 1. Busyout the board (busyout board UUCSS). 2. Test the board (test board long UUCSS). 3. If Test #1260 fails, replace the board. 4. If Test #1260 passes, make sure the ATM address on both the DEFINITY and the ATM switch sides are the same for this board. 5. If the address is the same, change the port on the ATM switch side. 6. If the error is resolved, the problem is on the ATM switch port.

j. Error Type 1537: LANHO bus timeout. The circuit pack is transmitting too many bytes on the LAN bus for a single frame. This may be due to:

- on-board fault
- faulty data received on one of the circuit pack's external ports

If the error occurs 3 times in 10 minutes, the board is isolated from the Packet Bus and the board is alarmed. To clear the alarm:

1. Restore this circuit pack to the Packet Bus with this command sequence:

a. busyout board UUCSS

10 Maintenance Object Repair Procedures

ATM-TRK (Circuit Emulation Service Circuit Pack)

10-273

- b. **reset board UUCSS**
- c. **test board UUCSS long**
- d. **release board UUCSS**

- 2. If the problem persists and there are no PKT-BUS or port alarms, replace the circuit pack.
- k. Error Type 1538: The ATM-TRK circuit pack is hyperactive (sending an abnormal number of control messages to the processor). Use the following command sequence for this ATM-TRK circuit pack:
 - 1. **busyout board UUCSS**
 - 2. **reset board UUCSS**
 - 3. **test board UUCSS long**
 - 4. **release board UUCSS**
- 5. If this error persists, replace the circuit pack.
- l. Error Type 1794: LANHO transmit FIFO overflow. The circuit pack's transmit buffers have overflowed.
 - 1. Run **test board UUCSS r 5**.

If	Then
Test #598 fails	Replace the circuit pack.

- m. Error Type 2049: ACL Link Failure (link is down). The ATM Control Link (ACL) has failed, communication has been interrupted between the SPE and the ATM-TRK circuit packs on the system, and signaling-group parameters are not communicated across the packet bus.
 - 1. Check the "[PKT-BUS \(Packet Bus\)](#)" and SYS-LINK (System Link) maintenance objects, and follow the repair procedures indicated.
 - 2. Run **test board UUCSS** against the ATM-TRK circuit pack.

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test.

- n. Error Type 2306: too many parity errors in data received from the LAN/packet bus.

1. Run **test board UUCSS**.

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test
Test 598 passes.	See the " PKT-BUS (Packet Bus) " maintenance object, and perform the specified repair.
There are no errors against the packet bus maintenance object.	This may be a transient condition. Do nothing now, but escalate if the error occurs repeatedly.

- o. Error Type 2561: Packet Interface Loop Around Test (598) Failure. The ATM-TRK circuit pack has failed, the packet bus has a minor alarm active, or the packet bus is out of service.

1. Run **test board UUCSS**.

If	Then
Test 598 fails.	Follow the repair procedures suggested for that test
Test 598 passes.	See the " PKT-BUS (Packet Bus) " maintenance object, and perform the specified repair.
There are no errors against the packet bus maintenance object.	This may be a transient condition. Do nothing now, but escalate if the error occurs repeatedly.

- p. Error Type 2817, 2818: DSP failure detected along the circuit path.

1. Run **test board UUCSS**.

2. Follow the repair procedures suggested for Test #1293.

Error Type	Description
2818	One or more DSPs failed. The <code>Aux Data</code> field contains the ID number of DSP that failed
2817	DSP test failure. The <code>Aux Data</code> field contains the following information about the failed DSPs: <ul style="list-style-type: none"> ■ X is the number of talker DSPs ■ Y is the number of listener DSPs ■ Z is the number of echo-cancelling DSPs

- q. Error Type 3330: LANHO critical error. The circuit pack reports that the on-board LANHO chip is insane (possibly due to a problem in Packet Bus arbitration, in the transmission line frame, or in the circuit pack itself). The circuit pack cannot talk to the Packet Bus.

1. Check for PKT-BUS alarms.

If	Then
There is a packet-bus alarm.	There is probably a packet-bus problem, particularly if other circuit packs on the packet bus report the same error. See the " PKT-BUS (Packet Bus) " maintenance object and the packet-bus fault-isolation and recovery sections of the maintenance manual for repair procedures.
There are no packet-bus alarms.	Run the following command sequence: busyout board UUCSS reset board UUCSS. test board UUCSS long release board UUCSS
The problem persists.	Replace the ATM-TRK circuit pack.

- r. Error Type 3585: Major board alarm; failure or critical components involved in the operation of the circuit pack. The circuit pack has failed, and the switch may no longer recognize it.

Aux Data	Description
1	ATM framer chip failure
2	NCE failed
4	TDM PLD failed
5	All DSPs on the circuit pack have failed
6	Receive Network Processor (RNP) failed
7	Transmit Network Processor (TNP) failed
8	MEMORY read/write failure
9	DUART failure

1. Run **test board UUCSS long**.

If	Then
Test #1259 fails with Error Code XYYY and XX is an AUX value in the preceding table	Replace the ATM-TRK circuit pack.
The system does not recognize the circuit pack	Replace the ATM-TRK circuit pack.

- s. Error Type 3841: the ATM-TRK circuit pack received an unrecognized message from the switch and responded with an inconsistent down-link error message.
 - 1. Do nothing. This error does not affect service.
- t. Error Type 3842: LANHO Receive FIFO Overflow error; the packet bus is delivering data to the ATM-TRK circuit pack faster than the circuit pack can distribute it to the endpoint.
 - 1. Do nothing. The circuit pack can recover by itself.
- u. Error Type 3999: circuit pack sent a large number of control channel messages to the switch within a short period of time.

If	Then
Error Type 1538 is also present	Circuit pack is taken out of service
If Error Type 1538 is not present	Circuit pack is <i>not</i> taken out of service, but has generated 50% of the messages necessary to be considered hyperactive. <ul style="list-style-type: none"> ■ This may be normal during heavy traffic. ■ If the error is logged during light traffic, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and error codes

Always investigate problems in the order presented. When you clear one of the error codes associated with a given test, you clear errors generated by other tests in the testing sequence. If you clear errors out of order, you can lose important information.

Table 10-118. System Technician-Demanded Tests: ATM-TRK

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
ATM Board Time Of Day Update (#1261)		X		ND
Connection Audit Test (#50)		X		ND
Control Channel Loop Test (#52)		X		ND

Continued on next page

Table 10-118. System Technician-Demanded Tests: ATM-TRK — Continued

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
Packet Interface Loop Around Test (#598)	X	X		ND
ATM DSP Test (#1293)	X	X		ND
ATM Board Framer Looparound Test (#1260)		X		D
ATM Board Error Query Test (#1259)	X	X		ND
ATM Cross Talk Test (#1298)		X		ND
ATM Board Reset (#1256)			X	D

¹ D = Destructive, ND = Non-destructive

Connection Audit Test (#50)

Non-destructive (in a sane switch environment).

The Connection Audit test updates TDM time slots. It sends network-update Control Channel Message Set (CCMS) messages that tell the ATM-TRK circuit pack to listen to, talk to, or disconnect particular time slots.

The test passes if software successfully sends the downlink network-update messages. It aborts otherwise.

CAUTION:

Though normally non-destructive, this test might unintentionally tear down an active call if the connection-manager software's tables are corrupt.

Table 10-119. TEST #50 Connection Audit Test

Error Code	Test Result	Description/ Recommendation
None 2100	ABORT	System resources required for this test are not available. 1. Retry the command up to 5 times at 1-minute intervals.
1019	ABORT	The test aborted because a test was already running on the port. 1. Retry the command up to 5 times at 1-minute intervals.
	FAIL	Internal system error 1. Retry the command up to 5 times at 1-minute intervals.
	PASS	The circuit pack has been updated with its translation.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check the board translations. 2. If the ATM-TRK circuit pack is not administered, run add atm trunk UUCSS . 3. If the ATM-TRK circuit pack is administered correctly, check the error log. 4. If ATM-TRK circuit pack is hyperactive, shut down, and reseal the circuit pack to force re-initialization. 5. If the ATM-TRK circuit pack is correctly inserted, run busyout board . 6. Run reset board . 7. Run release busy board . 8. Run test board long to re-establish the linkage between the internal ID and the port.

Control Channel Loop Test (#52)

The non-destructive Control Channel Loop Test is part of the maintenance subsystem's Common Port Board Testing feature. The Common Port Board test sends board vintage queries to a port circuit pack and checks the responses. CCMS downlink notifications tell the circuit pack which TDM Bus (A or B) carries the control channel and which carries the touch tones.

The test passes if the port circuit pack responds. The test aborts if the circuit pack does not respond. The test fails otherwise.

Table 10-120. Control Channel Test #52

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Test request timed out.
2100	ABORT	Could not allocate needed system resources.
2500	ABORT	Internal system error 1. Retry the command up to 3 times at 1-minute intervals.
	FAIL	The ATM circuit pack responded incorrectly. 1. Retry the command up to 3 times at 1-minute intervals. 2. If the test continues to fail, reset the ATM-TRK circuit pack (reset board UUCSS). 3. If test continues to fail, replace the circuit pack or transceiver.
	PASS	The ATM-TRK circuit pack is communicating correctly with the software.
0	NO BOARD	Circuit pack not detected. 1. Check the error log for Error 125 (wrong board) or Error 131 (no board), and correct any errors found. 2. Make sure that the ATM-TRK circuit pack is properly translated and inserted. 3. Check for Error 1538 (hyperactivity). If hyperactive, run reset board UUCSS . 4. Run the test again. If it fails, replace the ATM-TRK circuit pack, and retest.

Packet Interface Loop Around Test (#598)

This nondestructive test checks the ATM-TRK circuit pack's packet-bus interface. The LANHO chip sends data through the bus and back to itself. [Figure 10-203](#) describes this test, substituting "CES mode" for "PNC mode."

If the data received is consistent with the data sent, the test passes. The test does not run if the packet bus in the specified port network has a minor alarm, or is out of service, or if the packet bus in the PPN is out of service.\.

Table 10-121. Packet Interface Loop Around Test (#598)

Error Code	Test Result	Description/ Recommendation
1144	ABORT	The packet bus in the PPN has a major alarm against it. <ol style="list-style-type: none"> 1. Run display alarms and display errors. 2. Perform the PKT-BUS repair procedures associated with the alarms. 3. Retry the command.
2000	ABORT	Test request timed out. <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals. 2. If the test fails repeatedly, run reset board UUCSS. 3. If the test continues to fail, replace the ATM-TRK circuit pack.
2012	ABORT	Internal system error.
2100	ABORT	Could not allocate needed system resources. <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
ANY	FAIL	Data packet not received correctly by the ATM Interface circuit pack. <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals. 2. If the test continues to fail, replace the ATM-TRK circuit pack.
	PASS	The Packet Interface Test passed.

ATM Board Reset (#1256)

This test is destructive.

This test checks the sanity of the angel processor using the Sanity and Control Interface (SAKI) test (Common Port Board test #53). It resets the circuit pack if the SAKI test fails and runs the test again. The ATM Board Reset test passes if SAKI can successfully reset and retest the board.

Before running the SAKI test, you must:

- Move synchronization off the ATM-TRK circuit pack
- Busyout the ATM-TRK circuit pack

The test aborts if the ATM-TRK circuit pack is supplying synchronization.

Table 10-122. ATM Board Reset (#1256)

Error Code	Test Result	Description/ Recommendation
1005	ABORT	Wrong circuit pack configuration to run this test. The ATM CES Trunk Interface circuit pack provides timing for the system and cannot be reset without major system disruptions. <ol style="list-style-type: none"> 1. Set synchronization to another ATM CES trunk circuit pack or to the Tone-Clock circuit pack and test again.
1015	ABORT	Test cannot be run because the ATM-TRK circuit pack has not been busied out. <ol style="list-style-type: none"> 1. Busyout out the circuit pack (busyout board UUCSS). 2. Repeat the test (test board UUCSS long).
None	ABORT	Could not allocate the required system resources <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals. 2. If the test continues to abort escalate the problem.
2000	ABORT	Sanity test timed out. <ol style="list-style-type: none"> 1. Wait 5 minutes. Then see if ATM-TRK circuit pack is visible to the system by running list config all. 2. If the ATM-TRK circuit pack is visible (list configuration all), run the test again, and escalate if the problem recurs. 3. If the ATM-TRK circuit pack is not visible to the system (list configuration all), re-seat the ATM-TRK circuit pack, and retest. 4. If the ATM-TRK circuit pack is still not recognized by the system, replace the board.
2100	ABORT	Could not allocate required system resources <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
2500	ABORT	Internal system error. <ol style="list-style-type: none"> 1. Try to reset the circuit pack (reset board UUCSS).

Continued on next page

Table 10-122. ATM Board Reset (#1256) — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	The circuit pack failed to reset
2	FAIL	The circuit pack failed to restart. <ol style="list-style-type: none">1. Retry command.2. If the problem persists, replace the ATM-TRK circuit pack.
	PASS	The ATM-TRK circuit pack is successfully reset.
0	NO BOARD	No board detected. <ol style="list-style-type: none">1. Check the error log for Error 125 (wrong board) or Error 131 (no board), and perform the appropriate repair, if needed.2. Ensure that the board is properly translated and inserted.3. Check for Error 1538 (hyperactivity). If hyperactive, run reset board UUCSS.4. Run the test again. If it fails, replace the ATM-TRK circuit pack, and retest.

ATM Board Error Query Test (#1259)

This non-destructive ATM Error Query Test retrieves the most severe, active, on- and off-board problem from the ATM-TRK circuit pack's firmware and increments error counts in the Error Log.

The test passes if there are no errors and fails otherwise. A passing test clears the software counters; a failure increments the counter associated with the problem that caused the failure and clears the others.

Table 10-123. ATM Board Error Query Test (#1259)

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Test request timed out.
2031	ABORT	SCD failure. Unable to sent down-link message.
2100	ABORT	Could not allocate needed system resources.
2500	ABORT	Internal system error <ol style="list-style-type: none">1. Retry the command up to 3 times at 1-minute intervals.

25	Uncorrectable headers sent by the ATM switch.
26	Too may cells with invalid VPI/VCI combination.
27	The signalling link between the board and the ATM switch is down.
34	AAL5 Excessive retransmission requests -per VC
35	LAPD Excessive retransmission requests - per VC

ATM Board Framer Looparound Test (#1260)

Destructive

This test verifies the board's circuit (Time Division Multiplexing) and packet paths using an on-board, dummy virtual circuit. Before running the test, you must

- busyout the ATM-TRK circuit pack (**busyout board UUCSS**) and
- switch synchronization (**change synchronization**) from the ATM-TRK circuit pack

If the ATM-TRK circuit pack is supplying synchronization, the test aborts.

The test sends a digital counter from one of the tone generators via one of the TDM bus time slots. The ATM framer interface converts this digital counter to ATM cells and loops them back internally. The ATM-TRK circuit pack converts the cells back to a digital counter and sends it to the tone receiver for verification. If the circuit pack passes the circuit check, the software checks the packet path by sending a packet from the packet-interface circuit pack to the ATM-TRK circuit pack via the ATM protocol stack.

[Figure 10-210](#) and [Figure 10-211](#) show a diagrams of this two-part test, substituting "CES mode" for "PNC mode."

Table 10-126. ATM Board Framer Looparound Test (#1260)

Error Code	Test Result	Description/ Recommendation
1002	ABORT	Time slots could not be allocated. Traffic may be heavy or time slots may be out-of-service. <ol style="list-style-type: none">1. Run display errors, and perform repairs associated with TDM-BUS errors.2. Retry the command up to 3 times at 1-minute intervals.
1003	ABORT	Tone receiver could not be allocated. <ol style="list-style-type: none">1. Run display errors, and perform the repairs associated with TTR-LEV and TONE-PT errors. The test cannot run unless there is at least one Tone Detector available on the network that holds the ATM-TRK circuit pack.2. Retry the command up to 3 times at 1-minute intervals.
1015	ABORT	ATM-TRK circuit pack not busied out <ol style="list-style-type: none">1. Busyout the ATM circuit pack.2. Rerun the command.

Table 10-126. ATM Board Framer Looparound Test (#1260) — Continued

Error Code	Test Result	Description/ Recommendation
6	FAIL	A previously established looparound was not released. <ol style="list-style-type: none"> 1. Run reset board UUCSS. 2. Retry the command up to 3 times at 1-minute intervals. 3. If this test continues to fail, replace the ATM-TRK circuit pack. 4. Rerun test board UUCSS long.
	PASS	The non-optical parts of the ATM-TRK circuit pack are functioning properly.
0	NO BOARD	ATM-TRK circuit pack not found <ol style="list-style-type: none"> 1. Check the error log for Error 125 (wrong board) or Error 131 (no board), and correct as necessary. 2. Check that the board is properly translated and inserted. 3. Check for Error 1538 (hyperactivity), and run reset board UUCSS if necessary. 4. Rerun test board UUCSS long. 5. If the test fails, replace the board, and rerun test board UUCSS long.

ATM Board Time Of Day Update (#1261)

The non-destructive ATM-TOD-UPD test updates the system time that the ATM-TRK circuit pack uses for SDH/SONET performance monitoring and synchronizes the ATM-TRK circuit pack with the DEFINITY system clock. This test run during initialization, scheduled maintenance, and craft long test.

Table 10-127. ATM Board Time Of Day Update (#1261)

Error Code	Test Result	Description/ Recommendation
2031	FAIL	The attempt to send the message to the ATM-TRK circuit pack was not successful.
2500	FAIL	Internal system error. Did not send the time of day information to the board. <ol style="list-style-type: none">1. Retry the command up to 3 times at 1-minute intervals.2. If the test aborts with the same error code, escalate the problem.
	PASS	The ATM-TRK circuit pack is successfully updated with system time. <ol style="list-style-type: none">1. If the status port-network command still indicates that this link is down, it is possible that one or both of the ATM-TRK circuit packs have been busied out.2. If the link still does not come up, reset one or both ATM-TRK circuit packs on the link.
0	NO BOARD	No board detected. <ol style="list-style-type: none">1. Check the error log for wrong board (Error 125) or no board (Error 131). Resolve either of these issues, if applicable.2. Check that the board is properly translated and inserted. If so, check for hyperactivity (Error 1538). If hyperactive, use the reset board UUCSS command.3. Run the test again. If it fails, the board may be bad. Replace the board and retest.

ATM Board DSP Test (#1293)

Non-destructive

There are three kinds of digital signal processors (DSPs): talkers, listeners, and echo cancelers. Talkers put data on the TDM bus, listeners take data off the TDM bus, and echo cancelers filter out echoes of the main transmission. Firmware allocates DSPs in sets of three (one of each type), up to a maximum of 8 sets. This has three parts, one for each type of DSP. If the test fails for all DSPs, a MAJOR alarm is raised. If the test fails for one or more DSPs, a MINOR alarm is raised. If a DSP is busy, the test passes for that DSP. The test aborts if system resources are not available. Each part of the test returns the number of DSPs that passed or failed. This test run during initialization, error analysis testing, periodic, schedule, and craft short and long testing.

Table 10-128. ATM Board DSP Test (#1293)

Error Code	Test Result	Description/ Recommendation
1002	ABORT	Could not allocate time slots. Traffic may be heavy or time slots may be out-of-service <ol style="list-style-type: none"> 1. Run display errors, and follow associated repair procedures for TDM-BUS. 2. Retry the command up to 3 times at 1-minute intervals.
1003	ABORT	Could not allocate a tone detector. Too few tone detectors present or tone detectors out-of-service. <ol style="list-style-type: none"> 1. Run display errors, and follow the repair procedures associated with any “TTR-LEV (TTR Level)” errors that appear. 2. Make sure that there is at least one tone detector on the network that holds the ATM-TRK circuit pack. 3. Resolve any “TONE-PT (Tone Generator)” errors listed in the Error Log. 4. Retry the command up to 3 times at 1-minute intervals.
1962	ABORT	All DSPs are busy. This is a very unlikely event. <ol style="list-style-type: none"> 1. Retry the command up to 3 times at 1-minute intervals.
2000	ABORT	Test timed out. <ol style="list-style-type: none"> 1. If the ATM-TRK circuit pack is in standby, reset the board and run the test again after the ATM-TRK circuit pack is inserted. 2. Examine the Error Log for Error 1218 (bad DSP). 3. Run the test again.
2100	ABORT	Could not allocate required system resources.
2302	ABORT	Inconsistent uplink message from the ATM-TRK circuit pack.
2500	ABORT	Internal system error <ol style="list-style-type: none"> 1. Retry the command up to 5 times at 1-minute intervals.
2752	ABORT	Circuit pack not a TN230x.

Continued on next page

Table 10-128. ATM Board DSP Test (#1293) — Continued

Error Code	Test Result	Description/ Recommendation
XYZ	FAIL	<p>There is at least one bad DSP on the board. The X value indicates the number of bad talker DSPs, Y indicates the number of bad listener DSPs and Z indicates the number of bad echo canceler DSPs.</p> <ol style="list-style-type: none"> 1. Test the Active Tone-Clock on the port network that contains the ATM-TRK circuit pack for dial-tone. Repair as needed. 2. Repeat the short test on the ATM-TRK circuit pack. 3. If the test continues to fail, check for service-affecting MINOR alarms. If a MINOR alarm is raised for Error Type 2817 or 1818, replace the circuit pack. 4. If a WARNING alarm is raised, this is a non-service-affecting error, and the circuit pack can still process calls.
XY8	PASS	<p>The test passed for some or all DSPs. XY8 indicates the number of talker, listener, and echo-canceler DSPs for which the test passed (the rest of the DSPs were skipped). The X value indicates the number of good talker DSPs, Y indicates the number of good listener DSPs and Z indicates the number of good echo canceler DSPs.</p>
0	NO BOARD	<p>No board detected.</p> <ol style="list-style-type: none"> 1. Check the Error Log for wrong board Error 125 (wrong board) or Error 131 (no board). Replace or insert the circuit pack if necessary. 2. Check that the board is properly translated and inserted. 3. If Error 1538 (hyperactivity) is listed in the Error Log, and run reset board UUCSS. 4. Run the test again, and, if it fails, replace the ATM-TRK circuit pack. 5. Retest.

ATM Cross Talk Test (#1298)

This nondestructive ATM Cross Talk test makes sure that TDM time slots are correctly allocated to connections. It is useful for diagnosing one-way or noisy connections. The test fails if the TDM programmable logic and/or the interface to the DSP is not operating properly. The test can take more than 10 minutes.

[Figure 10-218](#) shows a diagram of this test, substituting “CES mode” for “PNC mode.”

Table 10-129. ATM Crosstalk Test (#1298)

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate required system resources. 1. Retry the command up to 5 times at 1-minute intervals.
1002	ABORT	Could not allocate time slots. Traffic may be heavy or time slots may be out-of-service. 1. Identify and correct TDM-bus errors (if any) using the procedures in the TDM-BUS maintenance object. 2. Repeat the test up to 5 times at 1-minute intervals.
1003	ABORT	Could not allocate a tone receiver. Too few tone detectors installed or tone detectors out-of-service. 1. Identify and correct any TTR-LEV errors listed in the Error Log. 2. Resolve any TONE-PT errors listed in the Error Log. 3. Retry the test up to 5 times at 1-minute intervals a maximum.
2000	ABORT	Test timed out.
2100	ABORT	Could not allocate required system resources 1. Retry the command 5 times at 1-minute intervals.
1962	ABORT	All TALKER DSPs are busy.
2302	ABORT	Inconsistent uplink message from the ATM-TRK circuit pack. 1. Retry the command up to 3 times at 1-minute intervals.
2752	ABORT	The circuit pack in this location is not a TN230x.
1-8, None	FAIL	ATM-TRK circuit pack writing on unauthorized TDM time slots. The error code indicates the number of TALKER DSPs that are at fault. These DSPs cannot be used again until this test of the ATM DSP Test (#1293) tells the circuit pack to use them again. 1. Retry the command up to 3 times at 1-minute intervals. 2. If the failure persists, replace the circuit pack.
1-8	PASS	ATM-TRK circuit pack not talking to un-authorized time slots on the TDM bus. The error code indicates the number of TALKER DSPs tested.

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
BRI-BD	MAJOR	test board PCSS I	ISDN-BRI Line Circuit Pack
BRI-BD	MINOR	test board PCSS I	ISDN-BRI Line Circuit Pack
BRI-BD	WARNING	test board PCSS sh	ISDN-BRI Line Circuit Pack
LGATE-BD	MAJOR	test board PCSS I	DEFINITY Lan Gateway
LGATE-BD	MINOR	test board PCSS I	DEFINITY Lan Gateway
LGATE-BD	WARNING	test board PCSS sh	DEFINITY Lan Gateway

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.).

NOTE:

Some of the information in this section is reserved for future use.

CAUTION:

A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction", in addition to the relevant MO documentation.

ISDN-BRI Line is a packet port circuit pack that provides access to ISDN-BRI endpoints. The ISDN-BRI Line circuit pack supports 12 ports, each of which provides access to ISDN stations. Voice and circuit-switched data from the ISDN stations are carried on the Time Division Multiplex (TDM) Bus. Signaling is carried over the Packet Bus.

LEDS

The ISDN-BRI Line circuit pack performs extensive initialization tests and lights both the red and green LEDS during the initialization testing. See Chapter 7, "LED Interpretation", for more details on circuit pack status LEDS.

Hardware Error Log Entries and Test to Clear Values

Table 10-130. BRI-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test board PCSS sh r 1
1(a)	Any	None	MINOR	ON

23(c)	0	None	WARNING	OFF	
257(d)	65535	Control Channel Loop Test (#52)	MINOR	ON	test board PCSS r 20
513(e)	4352 to 4357				
769(f)	4358				
1025(g)	4363	NPE Audit Test (#50)			
1293 to 1294 (h)	46088 to 46096	SAKI Sanity Test (#534)	MINOR	ON	See footnote (h)
1537 to 1538 (i)	46082		MINOR	ON	
1793 (j)	46080		MINOR	ON	
1794 (j)	46094		MINOR	ON	
1795 (j)	46085		MINOR	ON	
2306 (j)		LANBIC Receive Parity Error Counter Test (#595)			
3330 (k)	46083		MINOR	OFF	
3840 (l)	4096 to 4101				
3843 (m)	46097				
3999 (n)	Any	None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

 **NOTE:**

The alarm is logged approximately 11 minutes after the circuit pack has been removed and/or SAKI Sanity Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, then follow the instructions for “Red (alarm)” in the “Control and Port Circuit Pack Status LEDs” section in Chapter 7, “LED Interpretation”. (Also, refer to the “Handling Control Circuit Packs” section in Chapter 5, “Routine Maintenance Procedures”.

- b. This circuit pack has been busied out via the **busyout board PCSS** command.
- c. Port(s) has(have) been administered on this circuit pack but the circuit pack is not physically present.
- d. This error indicates transient communication problems between the switch and this circuit pack. Execute the **test board PCSS** command and refer to the repair procedures for the Control Channel Loop Around Test (#52).
- e. An on-board hardware failure has been detected by the circuit pack.

The reported aux data values correspond to the following detected errors:

4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4357	Instruction set error

Reset the circuit pack by executing the **busyout board PCSS** and **reset board PCSS** commands. When it is reset, the circuit pack executes a set of tests to detect the presence of any of the above faults. The detection of one of these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedure in footnote (a) for error type 1.

- f. This error is reported by the circuit pack when it detects a program logic error. While no action is required, this error may lead to errors of other types being reported against this circuit pack.
- g. This error is reported by the circuit pack when it cannot update NPE memory and read it back. This error type can be ignored, but may lead to errors of other types being reported against this circuit pack.

10 Maintenance Object Repair Procedures

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

10-296

- h. A critical hardware failure has been detected on the circuit pack. Reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board PCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack.

The reported error types correspond to the following detected errors:

1293	On-board auxiliary processor insane
1294	Internal memory access error

- i. These error types are reported when the following errors are detected:

1537 Frame overrun at Packet Bus interface. This condition may be caused by an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack are alarmed, refer to the repair procedures for those maintenance objects.

1538 Circuit packet is hyperactive; that is, it is flooding the switch with messages sent over the control channel. The circuit pack is taken out-of-service when a threshold number of these errors is reported to the switch. Clear the alarm via the following commands: **busyout board PCSS**, **reset board PCSS**, **test board PCSS long clear**, **release board PCSS**. If the error recurs within 10 minutes, then replace the circuit pack.

- j. These errors indicate that the circuit pack is having problems transmitting data to the Packet Bus.

1793 Parity errors are detected when transmitting data to the Packet Bus.

10 Maintenance Object Repair Procedures

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

10-297

- 1794 Overflow of Packet Bus transmit buffers has occurred.
- 1795 Circuit pack cannot find end of frame when transmitting to Packet Bus. Clear the alarm via the following commands: **busyout board PCSS**, **reset board PCSS**, **test board PCSS long clear**, **release board PCSS**. If the error recurs within 10 minutes, then replace the circuit pack.
- 2306 This error occurs when the circuit pack detects an error in a received frame from the packet bus. These errors are most likely caused by a packet bus problem, but may be due to a circuit pack fault. An invalid Link Access Procedure Data (LAPD) frame error occurs if the frame contains a bad Cyclical Redundancy Checking (CRC), is greater than the maximum length, or violates the link level protocol. When bus parity errors are reported, the LANBIC Receive Parity Error Counter Test (#595) should be performed to determine if the condition had cleared. Refer to the "PKT-BUS (Packet Bus)" Maintenance documentation to determine if the problem is isolated to this circuit pack or if the problem is caused by Packet Bus faults.

- k. A critical failure has been detected in the Packet Bus interface of the circuit pack. This failure may be due to either a Packet Bus fault or an on-board fault. If the Packet Bus is alarmed, refer to the "PKT-BUS (Packet Bus)" section and Chapter 9, "Packet Bus Fault Isolation and Correction" for recommended repair procedures. The probability of this error being related to Packet bus problems increases with the number of ISDN-BRI circuit packs displaying this error.

If the Packet Bus is not alarmed, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board PCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack. If the problem persists after complying with the above instructions, then follow normal escalation procedures.

- l. These errors are not service-affecting. No action is required. These errors are reported by the circuit pack when it receives a bad control channel message from the switch. The auxiliary data identifies the following error events:

- 4096 Bad major heading
- 4097 Bad port number
- 4098 Bad data

10 Maintenance Object Repair Procedures

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

10-298

- 4099 Bad sub-qualifier
- 4100 State inconsistency
- 4101 Inconsistent downlink message

m. This error is not service-affecting. No action is required.

3843 Bad translation RAM detected, but call continues by using another translation location.

n. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND¹
Control Channel Loop-Around Test (#52)	X	X	ND
NPE Audit Test (#50)		X	ND
LANBIC Receive Parity Error Counter Test (#595)		X	ND

¹ D = Destructive; ND = Nondestructive

NPE Audit Test (#50)

Refer to the repair procedure described in the “XXX-BD (Common Port Circuit Pack)” Maintenance documentation as NPE Audit Test (#50).

Control Channel Loop Around Test (#52)

Refer to the repair procedure described in the “XXX-BD (Common Port Circuit Pack)” Maintenance documentation as Control Channel Loop Around Test (#52).

SAKI Sanity Test (#53)

Refer to the repair procedure described in the “XXX-BD (Common Port Circuit Pack)” Maintenance documentation as SAKI Sanity Test (#53).

LANBIC Receive Parity Error Counter Test (#595)

This test is destructive.

The test reads and clears the LANBIC Receive Parity Error Counter on the circuit pack. This counter is incremented by the circuit pack when it detects a parity error in data received from the Packet Bus.

These errors may be indicative of a circuit pack problem, Packet Bus problem, or a problem with another circuit pack on the bus. This test is useful for verifying the repair of the problem.

Table 10-131. TEST #595 LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2012	ABORT	Internal System Error <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-131. TEST #595 LANBIC Receive Parity Error Counter Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1-10	FAIL	<p>The circuit pack is still detecting errors of this type. The error code indicates the value of the on-board error counter.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, verify the validity of the Packet Bus. Run the Packet Bus maintenance test with the test pkt P long command. If any Packet Bus tests fail, refer to the “PKT-BUS (Packet Bus)” Maintenance documentation for recommended repair procedures. 3. If the Packet Bus test passes, check the validity of the circuit pack. Execute a test that involves data transmission onto the Packet Bus. For example, the BRI may use the connectivity tests of the port-level maintenance object (BRI-PORT) by executing the test port PCSSpp command. Refer to the repair procedures for the executed test if it fails. Otherwise, proceed to the next step. 4. Other circuit packs on the Packet Bus may be the cause of the parity error. Use the display errors command to check the Error Log for other circuit packs that are alarmed. If any alarms are present for the other circuit packs, retire those alarms also. Then, rerun the LANBIC Receive Parity Error Counter Test (#595) on this circuit pack.
	PASS	No errors detected by circuit pack.

BRI-DAT (ISDN-BRI)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
BRI-DAT	WARNING ¹	test data-module	ISDN-BRI Standalone Data Module

1 The alarm level for ASAI adjuncts may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI adjuncts in the system.

Refer to BRI-SET (ISDN-BRI Set) Maintenance documentation.

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run¹	Full Name of MO
BRI-PORT	MINOR	test port PCSSpp l	ISDN-BRI Port
BRI-PORT	WARNING	test port PCSSpp sh	ISDN-BRI Port
ABRI-PORT	MAJOR ^{2, 3}	test port PCSSpp l	ASAI ISDN-BRI Port
ABRI-PORT	WARNING ^{2, 3}	test port PCSSpp l	ASAI ISDN-BRI Port
ATT-PORT	MAJOR ^{2, 3}	test port PCSSpp l	Lucent Adjunct ISDN-BRI Port
ATT-PORT	WARNING ^{2, 3}	test port PCSSpp l	Lucent Adjunct ISDN-BRI Port
LGATE-PORT	MAJOR ^{2, 3}	test port PCSSpp l	Ethernet ASAI Port
LGATE-PORT	WARNING ^{2, 3}	test port PCSSpp l	Ethernet ASAI Port
ATTE-PT	MAJOR ^{2, 3}	test port PCSSpp l	Ethernet Lucent Adjunct Port
ATTE-PT	WARNING ^{2, 3}	test port PCSSpp l	Ethernet Lucent Adjunct Port

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).
- 2 The alarm level for ASAI and Lucent adjunct ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI and Lucent adjunct ports in the system.
- 3 All alarming for an ASAI and Lucent adjunct and OFF-BOARD alarming for an ASAI or Lucent port is disabled if the ASAI or Lucent adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI or Lucent adjunct. The Hardware Error and Alarm Logs should be checked to see if the adjunct has disabled alarming.

NOTE:

Some of the information in this section is reserved for future use.

CAUTION:

A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction" in addition to the relevant MO documentation.

WARNING:

If a significant Packet Bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. Conditions under which this occurs are detailed in the "Maintenance of the Packet Bus" section of Chapter 9, "Packet Bus Fault Isolation and Correction".

The TN2208 LGATE MFB provides DEFINITY with the interface to Adjunct-Switch Application Interface (ASAI) and Lucent adjuncts (for example, CONVERSANT®. Voice System). The circuit pack contains 12 ports of line circuit interface (although only 8 are usable by the switch), each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the Lucent ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN2208 circuit pack which are connected to ASAI or Lucent adjuncts.

The TN556 and TN2198 ISDN-BRI Line circuit packs provide DEFINITY with the interface to ISDN-BRI end points, Adjunct-Switch Application Interface (ASAI) and Lucent adjuncts (for example, CONVERSANT®. Voice System). The circuit packs contain 12 ports of line circuit interface, each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the Lucent ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN556 and TN2198 circuit packs which are connected to either BRI endpoints or ASAI or Lucent adjuncts.

For BRI endpoints, each B-channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B-channels are not used on ports connected to ASAI or Lucent adjuncts. The D-channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or Lucent adjunct. Each ISDN-BRI D-channel is connected to the switch processor and the ISDN-BRI port through the Packet Control circuit pack and the Packet Bus.

ISDN-BRI endpoints are available in various configurations. All endpoints require the D-channel to convey signaling information to the switch. Only one B-channel is required for a voice-only set or a stand-alone data module (BRI-DAT). A voice and data-capable set requires both B-channels (one for voice and one for data). Therefore, each TN556 or TN2198 port can support either two voice-only sets, two stand-alone data modules (BRI-DAT), or one voice and data-capable set. Only a single ASAI or Lucent adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 10-6 illustrates the physical connection (solid line) between an ISDN-BRI Port and its associated ISDN-BRI set(s). Each physical connection allows for two B-channels and one D-channel. Each ISDN-BRI circuit pack can support up to 12 of these *physical* connections to different voice and voice/data sets or ASAI or Lucent adjuncts. On a TN2198 each ISDN-BRI circuit pack can support up to 12 *physical* connections to a NT1, which, in turn, connects to 2 terminals.

This section covers the maintenance documentation for ISDN-BRI ports. Some of the results of maintenance testing of ISDN-BRI ports may be affected by the health of the ISDN-BRI Line circuit pack (BRI-BD), BRI endpoint (BRI-SET), or ASAI adjunct (ASAI-AJ/LGATE-AJ) or Lucent adjunct (ATT_AJ/ATTE-AJ). These interactions should be kept in mind when investigating the cause of ISDN-BRI port problems. For more information on the circuit pack and endpoints, refer to the BRI-BD (ISDN-BRI Line Circuit Pack) Maintenance documentation, the BRI-SET (ISDN-BRI Endpoint) Maintenance documentation, and ASAI-AJ (Adjunct-Switch Application Interface) Maintenance documentation, ATT-AJ (Lucent Adjunct) Maintenance documentation, LGATE-AJ (Ethernet Adjunct-Switch Application Interface) Maintenance documentation, and ATTE-AJ (Ethernet Lucent Adjunct) Maintenance documentation.

Error Type	Aux Data	Associated Test	Alarm Level BRI-PORT	Alarm Level ABRI-PORT ATT-PORT LGATE-PORT ATTE-PT	On/ Off Board	Test to Clear Value
3845 (m)		None				
3846 (n)	TEI	None				
3847 (o)	0	None				

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description, and follow the recommended procedures.
- 2 Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

- a. This error occurs when the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The aux data field contains one of the following values:
 - blank - this indicates that the Level 1 Status Inquiry failed.
 - 32773 - this is a message from the BRI-LINE circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

- b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.
- c. This error occurs when the EPF Status Inquiry fails due to an overcurrent condition or when the BRI-LINE circuit pack detects that the EPF is in an over current condition. The aux data field contains one of the following values:
 - blank - this indicates that the EPF Status Inquiry failed due to an overcurrent condition.
 - 40988 - this indicates that the BRI-LINE circuit pack has detected an overcurrent condition and has turned the EPF off.

Execute the Short Test Sequence and see the repair procedures for Test #622.

- d. This error indicates that the circuit pack is having problems transmitting data to the Packet Bus, thus affecting the conveyance of signaling information over the D-channel. With Aux Data 46222, this error occurs

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-306

when the Packet Bus transmit buffers overflow. This condition probably indicates a hardware problem. The BRI-PORT Alarm Level for the error with Aux Data 46222 is "MIN/WRN," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJ/MIN/WNR." With Aux Data 0, this error occurs whenever the Packet Bus transmit FIFO buffers overflow. This condition can be caused by an on-board hardware problem as well as by problems on the Packet Bus that disrupt the BRI circuit pack's ability to transmit data onto the Packet Bus. Use troubleshooting procedures for both on-board hardware problems and potential off-board Packet Bus problems. See the "PKT-BUS (Packet Bus)" Maintenance section in this chapter as well as Chapter 9, "Packet Bus Fault Isolation and Correction" for more details on Packet Bus troubleshooting procedures. The BRI-PORT Alarm Level for the error with Aux Data 0 is "MINOR," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR."

- e. This error occurs when the NPE Crosstalk Test (#617) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #617.
- f. This error occurs when broadcast signaling links associated with this port have too much link establishment related traffic. This could occur if an endpoint on this port is sending link establishment traffic on a port level broadcast link, or if there are Level 1 problems on the port. Check the error logs for Level 1 errors. If Level 1 problems exist, follow the repair procedures listed for test #621. Software will suspend activity to this port for 75 minutes when the port is alarmed due to this error (note that service suspension does not occur if the port is an ABRI-PORT/LGATE-PT/ATTE-PT/ATT-PORT). If this problem persists, replace the endpoint or endpoints associated with this port. If replacing the endpoints does not fix the problem, follow normal escalation procedures.
- g. This error occurs when the port receives an invalid frame over the D-channel. When CRC errors exceed five within 15 minutes, the port is taken out of service for five seconds. If five more CRC errors are received within 15 minutes of the first set of five errors, the port is taken out of service for one minute. If five more CRC errors are received within 15 minutes of the last five, the port is taken out of service for 15 minutes.

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
 - If the problem persists, replace the endpoints or adjuncts, or escalate the problem.
- h. This error occurs when the BRI Port Local TDM Loop Around Test (#619) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #619.

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-307

There are no Test to Clear Values for the following error types. The error types are simply provided as additional data that may prove useful while troubleshooting.

- i. This error occurs when a Layer 1 Transmission error is detected for the port. Run the Long Test Sequence, and pay particular attention to the results of the Layer 1 Transmission Error Counter Test (#624).
- j. A BRI port supports up to three Terminal Endpoint Identifiers (Ties). This error occurs when the switch receives a request for a fourth TEI on a port. Check the number of endpoints administered for this port.
- k. This error occurs when an SPID initialization request is made from an endpoint and the switch determines that the SPID value is invalid or is a duplicate of another SPID that is already initialized at Layer 3 on the port. Check the administration of the endpoints.
- l. This error occurs when the circuit pack detects an overflow of its receive buffers. Run the Long Test Sequence, and pay particular attention to the results of the Receive First In First Out (FIFO) Overflow Error Counter Test (#625).
- m. This error occurs when the BRI Port Local LAN Loop Around Test (#618) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #618.
- n. This error most likely occurs when the Terminal Endpoint Identifier (TEI) administered for the ASAI or Lucent endpoint does not match the TEI administered in the ASAI or Lucent adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.
- o. Indicates that sets on the port do not support Layer 3 initialization. Consult the Service Set documentation.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-308

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND¹
NPE Crosstalk Test (#617)		X	D
BRI Port Local LAN Loop Around Test (#618)		X	D
BRI Port Local TDM Loop Around Test (#619)		X	D
Electronic Power Feed Restoral Test (#620)	X	X	ND
Level 1 Status Inquiry Test (#621)	X	X	ND
Electronic Power Feed Inquiry Test (#622)	X	X	ND
CRC Error Counter Test (#623)		X	ND
Layer 1 Transmission Error Counter Test (#624)		X	ND
Receive FIFO Overflow Error Counter Test (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

¹ D = Destructive; ND = Nondestructive

NOTE:

The NPE Crosstalk Test and the BRI Port Local TDM Loop Around Test are not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT.

NPE Crosstalk Test (#617)

This test is destructive.

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence and takes approximately 20 to 30 seconds to complete. Crosstalk testing is performed on both B-channels (B1 and B2) associated with a BRI port. If this test fails on either channel, any endpoints connected to the port are taken out-of-service.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B-channels associated with the port are not used by ASAI or Lucent adjuncts.

Table 10-133. TEST #617 Loop Around Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension or trunk group/member number of the port. Use the status bri-port PCSSpp command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting. <ol style="list-style-type: none"> 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use the status station command for the station associated with this port and determine when the port is available for testing. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	This test is not valid for this type of translation. Ports administered as "ASAI" or "ADJK" cannot run this test, because the B channels associated with the port are not used by ASAI or Lucent Adjunct Links. This is a normal condition.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
1, 2	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Error code 1 indicates that the NPE Crosstalk Test failed on Channel B1. Error code 2 indicates that the NPE Crosstalk Test failed on Channel B1. <ol style="list-style-type: none"> 1. Replace circuit pack.
	PASS	The port is correctly using its allocated time slots. <ol style="list-style-type: none"> 1. To be sure that this is not an intermittent problem, repeat this test a maximum of 10 times to make sure it continues to pass. 2. If complaints still exist, examine the station, connections, and wiring.

BRI Port Local LAN Loop Around Test (#618)

This test is destructive.

This test, which verifies the connectivity of a BRI port across the LAN Bus, executes only if the port is out-of-service. The test aborts if calls associated with

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-310

the port are in-progress. Failures of this test indicate either on-board faults associated with the BRI-PORT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the BRI-PORT.

The dotted lines in Figure 10-7 show how a Loop Around Test is performed across the Packet Bus for the D-channel.

Figure 10-17. Path of the BRI Port Local LAN Loop Around

Table 10-134. TEST #618 BRI Port Local LAN Loop Around

Error Code	Test Result	Description/ Recommendation
1015	ABORT	<p>The port is not in the out-of-service service state.</p> <ol style="list-style-type: none"> 1. Display the BRI Port Status form via the status bri-port PCSSpp command to determine which stations or adjuncts are on this port. 2. Use the extension shown on this form in the status station command to determine if the station or adjunct is in use. 3. If it is in use, wait until it is idle, and then busyout the port (using the busyout port PCSSpp command) to place it in the out-of-service state and repeat this test. <p> WARNING: <i>Since the "busyout" command is destructive, execution of this command prior to the port being idle causes all calls associated with BRI endpoints and all transactions associated with ASAI or Lucent adjuncts on the port to be torn down. Note that third party calls established by an ASAI or Lucent adjunct remain connected even though the port is taken out-of-service.</i></p>
1139	ABORT	<p>The Packet Bus in the port network is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	<p>The PKT-CTRL is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the PKT-CTRL. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1144	ABORT	<p>The PPN Packet Bus is out-of-service.</p> <ol style="list-style-type: none"> 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
2012	ABORT	<p>Internal System Error.</p>
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-312

Table 10-134. TEST #618 BRI Port Local LAN Loop Around — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	The Loop Around Test has failed. <ol style="list-style-type: none">1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are not in use. Reset the circuit pack by issuing the busyout board PCSS and the reset board PCSS commands.2. If the test fails again, execute test port-network <pn#> on the G3MT terminal. If this fails, follow failure procedures in PKT-BUS section.3. If tests executed in Step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	The BRI Port Local LAN Loop Around Test has passed.

BRI Port Local TDM Loop Around Test (#619)

This test is destructive.

This test verifies the connectivity of a BRI port across the TDM Bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

This Loop Around Test runs a series of individual tests on the two B-channels (B1 and B2) associated with the port. It is a collection of the following:

- A Loop Around Test across the TDM Bus for B1.
- A Conference Circuit Test for B1.
- A Loop Around Test across the TDM Bus for B2.
- A Conference Circuit Test for B2.

The tests are run in the above order. If one fails, the remaining tests in the sequence are not executed. An error code is returned at that point.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B-channels associated with the port are not used by ASAI or Lucent adjuncts.

The dotted lines in Figure 10-8 show how a Loop Around Test is performed for the B-channels. The figure shows a terminal connected to a BRI line board using a TN556. If a TN2198 is used, the terminal would be connected to a NT1, and the NT1 to the BRI board.

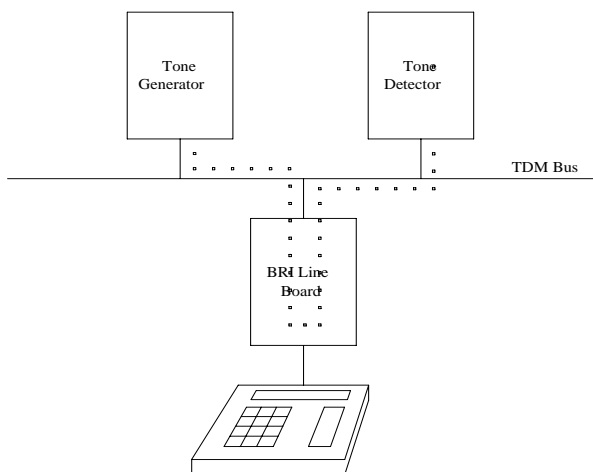

Figure 10-18. Path of the BRI Port Local TDM Loop Around

Table 10-135. TEST #619 BRI Port Local TDM Loop Around

Error Code	Test Result	Description/ Recommendation
1000	ABORT	<p>The system resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the station extension or trunk group/member number of the port. Use the status bri-port PCSSpp command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. If the port is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) Maintenance documentation to diagnose any active TDM Bus errors.</p> <ol style="list-style-type: none"> 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-315

Table 10-135. TEST #619 BRI Port Local TDM Loop Around — Continued

Error Code	Test Result	Description/ Recommendation
7, 8	FAIL	<p>As stated previously, this test runs a Conference Circuit Test on each B-channel. A failure here indicates that one of these conference tests failed; Error Code 7 means that the test failed on B1; Error Code 8 means that the test failed on B2.</p> <ol style="list-style-type: none">1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the circuit pack are not in use. Reset the circuit pack by issuing the busyout board PCSS and the reset board PCSS commands.2. If the test fails again, replace the circuit pack.
	PASS	The BRI Port Local TDM Loop Around Test has passed.

Electronic Power Feed Restoral Test (#620)

This test attempts to restore the Electronic Power Feed (EPF) on an ISDN-BRI port twice. In this test, the processor requests that the EPF be turned on for a given port. An attempt is made to turn on the power unit to the station or adjunct. If no current is being drawn by a station, this probably indicates that the station is not connected. No current being drawn by an adjunct is the normal condition. If an overcurrent condition is sensed (that is, too much current is being drawn), this condition may indicate a short in the wiring to the endpoint or adjunct. Depending on what condition is sensed, a message is returned stating that either the EPF was turned on successfully with no problems or that an overcurrent condition is sensed. This response is reported by the Electronic Power Feed Inquiry (#622), which follows in the testing sequence. EPF Restoral is attempted again by this test five seconds later. This test always passes for the TN2198 because it has no EPF. This test will always abort when run on the TN2208.

Table 10-136. TEST #620 Electronic Power Feed Restoral

Error Code	Test Result	Description / Recommendation
1005	ABORT	This test is not valid for this port type. The TN2208 does not have an electronic power feed, and the test will abort.
2012	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The EPF Test passed. The message to turn on the power feed to the station or the adjunct was successfully sent to the port. 1. Although this test should not return a fail result, after running this test, the Error Log should be checked for any entries with error type 257 to examine the real results of this test. 2. An error type of 257 in the Error Log indicates some problem with the power to the station or the adjunct. Check for a short in the wiring, a damaged jack, a defective voice terminal or adjunct, or an incorrect type of terminal.

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the physical layer (that is, Level 1). Level 1 can be in one of three possible states: Activated, Pending Activation, or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI or Lucent adjunct administered on this port. This test passes if the state of Level 1 (L1) is Activated. This test also passes if software has taken this port out of service. See the description of the Level 1 "Deactivated State" below for more details.

The Pending Activation state indicates a problem with the endpoints or adjunct, the wiring to the sets or adjunct, or the BRI-LINE circuit pack. When in this state, the Level 1 interface is either not receiving any L1 framing from the endpoint or adjunct (Endpoint Idle), or it is communicating with the endpoint or adjunct but cannot transition to the Activated state (Endpoint Active).

The Deactivated state indicates a problem with the BRI-LINE circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ISDN-BRI port is placed in the out-of-service

state, Level 1 is also put into the Deactivated state. This could be due either to the system detecting a fault with the port or to a **busyout port PCSSpp** request.

Table 10-137. TEST #621 Level 1 Status Inquiry

Error Code	Test Result	Description/ Recommendation
1187	ABORT	<p>The board, port or station may have been busied out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (port busied out) for this port and BRI-BD (board busied out). If this error type is present for BRI-PORT only, then release the port via the release port pp command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the board via the release port PCSS command and run the test again. <p>⇒ NOTE: When you release a port, you release all ports associated with it. If certain ports still need to be busied out, use the release port PCSSpp command to busy them out.</p> <ol style="list-style-type: none"> 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	<p>Response to the test was not received from the circuit pack within the allowable time period.</p> <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-137. TEST #621 Level 1 Status Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	<p>Received a status of Level 1 Pending Activation-Endpoint Idle which indicates a problem with the BRI endpoint or ASAI or Lucent adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port.</p> <p>For the TN2198, received a status of Level 1 Pending Activation. U interface down, which indicates a problem with a connection between the switch and the NT1.</p> <p>⇒ NOTE: An NT1 is a 2- to 4-wire converter that is used to connect 4-wire Lucent terminals to a 2-wire TN2198 circuit pack. The NT1 also has status lamps to determine the health of the unit.</p> <ol style="list-style-type: none"> For the TN556 or TN2208, verify that an endpoint is connected to the port. If an endpoint is connected to the port, then proceed to step 2. For the TN2198 verify that the connections are good between the switch and the NT1. Verify that the NT1 has power. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. If a TN2198 is used, the set must have been plugged in for at least 15 seconds before it will stabilize. Execute the test port PCSSpp command, and review the results of the Level 1 Status Inquiry Test to verify the repair. If this test is still failing, proceed to Step 3. For BRI endpoints, replace the BRI endpoint(s) connected to the port or the NT1 if a TN2198 is used. For ASAI or Lucent adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the manufacturers repair procedures. Then execute the test port PCSSpp command and review the results of the Level 1 Status Inquiry Test to verify repair. If this test is still failing, proceed to Step 4. Escalate the problem to the next tier.

Table 10-137. TEST #621 Level 1 Status Inquiry — Continued

Error Code	Test Result	Description/ Recommendation
2	FAIL	<p>For the TN556 or TN2208, received a status of Level 1 Pending Activation-Endpoint Active which indicates a problem with the BRI endpoint or ASAI or Lucent adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port.</p> <p>For the TN2198, received a status of Level 1 Pending Activation. U interface up S/T interface down, which indicates a problem with the NT1 or the wiring between the NT1 and the BRI endpoint (S/T interface).</p> <ol style="list-style-type: none"> 1. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Execute the test port PCSSpp command, and review the results of the Level 1 Status Inquiry test to verify the repair. If this test is still failing, proceed to Step 2. 2. For BRI endpoints, try replacing the BRI endpoint(s) connected to the port. For ASAI or Lucent adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the recommended repair procedures of the manufacturer. Then execute the test port PCSSpp command, and review the results of the Level 1 Status Inquiry test to verify repair. If this test is still failing, proceed to Step 3. 3. Escalate the problem to the next tier.
3	FAIL	<p>Received a status of Level 1 Deactivated; the port is out-of-service.</p> <ol style="list-style-type: none"> 1. Issue the status bri-port PCSSpp command to verify that the service state of the port is out-of-service. If the service state of the port is not out-of-service, escalate the problem to the next tier. Otherwise, proceed to Step 2. 2. If the port has been placed out-of-service via the busyout port PCSSpp command, try releasing the port by executing the release port PCSSpp command. Then issue the test port long PCSSpp command, and review the results of Level 1 Status Inquiry test. If this test is still failing, proceed to Step 3. 3. After executing the test port long PCSSpp command, review the results of all the tests. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing the test port PCSSpp command and by determining that the Level 1 Status test passes. If the test continues to fail for this reason, proceed to Step 4. 4. Escalate the problem to the next tier.

Continued on next page

Table 10-137. TEST #621 Level 1 Status Inquiry — Continued

Error Code	Test Result	Description/ Recommendation
4	FAIL	For the TN2198 only: Received a status of Level 1 Pending Activation, the NT1 has a loss of power indicating a problem with the NT1. <ol style="list-style-type: none"> 1. For the NT1 follow the manufacturers recommended repair procedures. 2. Execute the test port PCSSpp command, and review the results of the Level 1 Status Inquiry test to verify the repair. If the test is still failing proceed to Step 3. 3. Escalate the problem to the next tier.
	PASS	This test indicates that Level 1 is activated, or that software has taken the port out of service.

Electronic Power Feed Inquiry (#622)

This test queries the BRI-LINE circuit pack for the status of the Electronic Power Feed (EPF) supplied to a BRI endpoint or an ASAI or Lucent adjunct. If the EPF is on and no overcurrent condition exists, this test passes. All other states are not normal and indicate a problem with the endpoint or adjunct, the wiring to the endpoint or adjunct, or the BRI-LINE circuit pack. This test is not run on the TN2208 circuit pack or the TN2198 and will always return a pass for a TN2198. The TN2208 has no power feeds.

Table 10-138. TEST #622 Electronic Power Feed Inquiry

Error Code	Test Result	Description/ Recommendation
1005	ABORT	This test is not valid for this port type. Ports on the TN2208 cannot run this test because this board does not have an electronic power feed.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-321

Table 10-138. TEST #622 Electronic Power Feed Inquiry — Continued

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	The BRI-LINE circuit pack reports that it has detected an overcurrent condition and has turned off the EPF. 1. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Check the endpoints and replace one or both sets if the sets are drawing too much current. Execute the test port PCSSpp command and review the results of the EPF Inquiry Test to verify the repair. If this test is still failing, proceed to Step 2. 2. Execute the test port PCSSpp command, and review the results of the Level 1 Status Inquiry Test. If this test is also failing, then follow the repair procedure for the Level 1 Status Inquiry Test. Otherwise, escalate this problem to the next tier.
	PASS	The Electronic Power Feed Inquiry Test reports that the EPF is on.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or the endpoint or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY Communications System Generic 1 and Generic 3i Wiring*, 555-204-111). It does not indicate a problem with the ISDN-BRI circuit pack. This test is useful for verifying the repair of the problem.

Table 10-139. TEST #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate necessary system resources to run test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, review the results of other tests in the Long Test Sequence. Pay particular attention to the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. 3. If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter Test continues to fail, check the wiring to the endpoints or adjunct. If the wiring appears to be fine, escalate the problem.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Receive FIFO Overflow Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO Overflow error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from the Packet Bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port OR if a hardware fault is causing the receive buffers not to be emptied properly by the circuit pack. This test is useful for verifying the repair of the problem.

Table 10-140. TEST #625 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. <ol style="list-style-type: none"> 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the busyout board PCSS and reset board PCSS commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, run the Long Test Sequence and pay particular attention to the Loop Around Tests (#618 and #619). See the repair procedures for the executed test if it fails. Otherwise, go to the next step. 3. Replace the circuit pack.
	PASS	The Receive FIFO Overflow error counter was read correctly and has a value of 0.

Clear Error Counters Test (#270)

This test is not an actual test in the strict sense of the word. There are various error counters associated with each BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. This test clears those counters and triggers the auditing of Terminal Endpoint Identifier (TEI) values and layer 3 reinitialization. This test is used only to send messages to the BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT and, therefore, should neither abort nor fail.

10 Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

10-324

Table 10-141. TEST #270 Clear Error Counters

Error Code	Test Result	Description/ Recommendation
Any	ABORT	This test should never abort.
Any	FAIL	This test should never fail. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The message to clear the error counters of the BRI-Port/ABRI-Port/ATT-PORT/LGATE-PT/ATTE-PT has been sent.

BRI-DAT		test data-module	

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01). The alternate name field contains the extension of the endpoint. This field is used to distinguish between endpoints on the same port.
- 2 The alarm level for ASAI and Lucent adjuncts may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI and Lucent adjuncts in the system.
- 3 Alarming for an ASAI and Lucent adjuncts is disabled if the adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm are logged against the endpoint. Busing out and releasing the ASAI station or ADJLK station will clear the alarm.

CAUTION:

A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction" in addition to the relevant MO documentation.

**WARNING:**

If a significant Packet Bus failure occurs, errors and alarms may not be logged as expected for BRI-SET/BRI-DAT/ASAI-ADJ/ATT-ADJ/LGATE-AJ/ATTE-AJ. Conditions under which this occurs are detailed in the "Maintenance of the Packet Bus" section of Chapter 9, "Packet Bus Fault Isolation and Correction".

The TN2208 ESAI MFB provides DEFINITY with an Ethernet interface to Adjunct-Switch Application Interface (ASAI) and Lucent adjuncts (for example, CONVERSANT[®] Voice System). This circuit pack contains 8 ports of line circuit interface, each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the Lucent ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN2208 MFB circuit pack which is connected to ASAI or Lucent adjuncts. The TN2208 ESAI MFB is handled by switch software as it is an ISDN BRI compatible board and all maintenance actions referring to ASAI and Lucent Adjunct Links in this section apply.

In G3iV1.1-286 and G3iV2-386, two types of ISDN-BRI endpoints may be connected to ISDN-BRI (ISDN Basic Rate Interface Line) TN556 and TN2198 circuit packs: ISDN-BRI station endpoints, ASAI (Adjunct-Switch Application Interface) and Lucent adjuncts (for example CONVERSANT[®] Voice System). These circuit packs contain 12 ports of line circuit interfaces, each of which operates at 192 kilobits per second (kbps) with two B-channels and one D-channel as specified in the Lucent ISDN-BRI specification (PUB 801-802-100). For BRI endpoints, each B-channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B-channels are not used by ASAI or Lucent adjuncts. The D-channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or Lucent adjuncts. Each ISDN-BRI D-channel is connected to the switch processor and the ISDN-BRI port through the PKT-CTRL (Packet Control) and the PKT-BUS (Packet Bus).

ISDN-BRI endpoints come in a number of configurations. All endpoints require the D-channel to convey signaling information to the switch. A voice-only set requires only one B-channel. A voice and data-capable set requires both B-channels (one for voice and one for data). Therefore, each TN556 port can support either two voice-only sets or one voice and data-capable set. Only a single ASAI or Lucent adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 10-9 illustrates the physical connection (solid line) between an ISDN-BRI Circuit Pack and a voice or voice/data set. Each physical connection allows for two B-channels, as stated above, plus one D-channel. Each ISDN-BRI circuit pack can support up to 12 of these PHYSICAL connections to different voice and voice/data sets or ASAI and Lucent adjuncts.

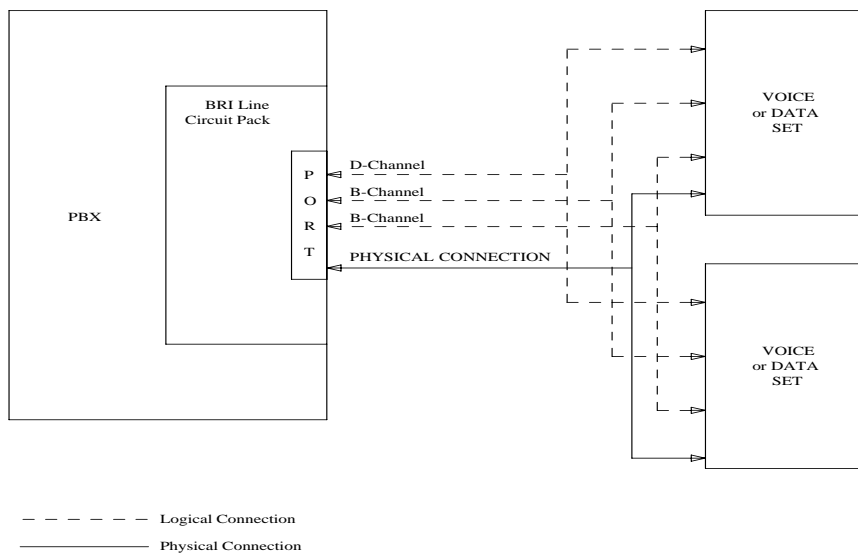

Figure 10-19. ISDN-BRI Set Interactions

This section contains the ISDN-BRI Set, ASAI Adjunct, and Lucent Adjunct Maintenance documentation. Some of the results of maintenance testing of the ISDN-BRI Set or the ASAI and Lucent Adjunct may be affected by the health of the ISDN-BRI circuit pack and Port. These interactions should be kept in mind when investigating the cause of ISDN-BRI Set problems.

Table 10-142. BRI-SET/ASAI-ADJ Error Log Entries — Continued

Error Type	Aux Data	Associated Test	Alarm Level BRI-PORT	Alarm Level ABRI-PORT ATT-PORT LGATE-PORT ATTE-PT	On/ Off Board	Test to Clear Value
3584	0, 1	None				
3585-3839(i)	0	None				
3840-4095(m)(n)	0	None				

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Major alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

- a. Errors of this type indicate violations of the ISDN-BRI signaling protocol; timers associated with certain Layer 3 messages have expired before a required response was received. In the following table, the aux data field indicates which timer has just expired. (For more information, refer to the Lucent ISDN-BRI Specification.)

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)
6	Second T308 (RELease timer)
10	T316 (REStart timer)
12	T309 (Layer 2 Failure timer)
16	TM100 (Management Information Message timer 1)
17	TM200 (Management Information Message timer 2)
102	TASAI (ASAI Routing Timer)

The switch sent a message to the endpoint which did not respond in the allotted time. This can happen occasionally due to failure of the point-to-point signaling link or because of a problem in the BRI endpoint or ASAI adjunct or Lucent adjunct. Execute the **test station extension sh** command and pay particular attention to the results of the BRI Layer 3 Query Test (#629). If this test fails, follow the repair procedure for Test #629.

- b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.
- c. This error occurs when the endpoint does not respond to the service state query message sent to the adjunct or the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or the adjunct.

For BRI endpoints, the Aux Data field for this error contains "0." When it occurs, execute the **test station extension sh** command and pay particular attention to the results of the BRI Layer 3 Query Test (#629). If this test fails, follow the repair procedure for Test #629.

When this error occurs for an ASAI or Lucent adjunct, the Aux Data field indicates the state of the ASAI link or Lucent link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to Layer 3 query
154	13-restarted	Invalid response to Layer 3 query
202	13-established	No response to Layer 3 query
204	13-established	Invalid response to Layer 3 query

(See "Status BRI-Port" in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids" for an explanation of the ASAI link states.)

For ASAI or Lucent adjuncts, the switch automatically queries the adjunct every two minutes (and therefore the Layer 3 Query Test is not executed for ASAI or Lucent adjuncts via a command issued from the G3MT terminal). While alarmed for this error, the switch momentarily (for five seconds) takes the associated port out-of-service every 15 minutes. This action is taken in an attempt to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Lucent adjunct, the service technician should:

1. Execute the **test station extension** command, paying particular attention to any tests which fail, and perform the associated repair procedures for those tests.
 2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
 3. The alarm condition persists and, if the above steps do not resolve the problem, follow normal escalation procedures.
- d. This error and associated WARNING alarm are logged against an ASAI or Lucent endpoint when the adjunct has asked the switch to suspend Maintenance on the ASAI or Lucent endpoint. Busying out and releasing the ASAI station or ADJLK station will clear this alarm.
- e. This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.
- f. This error occurs when the signaling link associated with a BRI endpoint has too much link establishment related traffic. This could occur if the signaling link is bouncing between assigned and established states. Software will suspend activity to this endpoint for 75 minutes when the endpoint is alarmed due to this problem (note that service suspension does not occur if the endpoint is an ASAI or Lucent adjunct). If this problem persists, replace the endpoint. If replacing the endpoint does not fix the problem, follow normal escalation procedures.
- g. This error occurs when the ASAI-ADJ or ATT-ADJ or LGATE-AJ or ATTE-AJ message is not transmitted because the PKT-CTRL (Packet Control Circuit Pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or Lucent adjunct. Attempt to resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- h. This error occurs when the ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or Lucent adjunct. Attempt to resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

- i. This error indicates a problem with Layer 2 over the D-channel between the switch and the endpoint. When this error occurs, an alarm is raised against the station or adjunct. Execute the **test station <extension> short** command and pay particular attention to the results of the BRI XID Test (#628). If this test fails, follow the repair procedure for Test #628.
- j. This error indicates a problem with the B-channel connection between the switch and the endpoint. When this error occurs, a warning alarm is raised against the endpoint. Execute the **test station <extension> long** command, and pay particular attention to the results of the BRI Remote Loop Back Test (#627). If this test fails, follow the repair procedure for Test #627.
- k. This error occurs whenever the point-to-point signaling link to the endpoint goes down (except when it goes down because either the PKT-CTRL or the PKT-BUS has failed or has been busied out by system technician). When this error occurs, an alarm is raised against the endpoint or adjunct. Execute the **test station <extension> short** command and pay particular attention to the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is reestablished to the endpoint or adjunct.
- l. Certain ASAI protocol-specific cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3712, then the ASAI cause code is equal to the error type minus 3712. This code was sent to the adjunct by the switch.

If the error type is less than 3712, then the ASAI cause code is equal to the error type minus 3584. This code was sent to the switch by the adjunct.

A description of the various ASAI cause values is contained in the Table 10-64. This table also contains recommended system technician actions associated with the cause value. Further information can also be found in the Lucent ASAI Specification (288-500-03). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

Table 10-143. ASAI Cause Values

Code	Explanation	Recommendation
	Service or Option Not Available	
0	Unrecognized ASAI Protocol Operation	<p>Requested ASAI protocol operation is not implemented by the switch or adjunct. Aux Data field of Error Log entry contains protocol identifier for unrecognized operation.</p> <ol style="list-style-type: none"> 1. Consult switch and adjunct documentation to determine which set of operations is supported by the switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem. 2. If Step 1 does not resolve the problem, escalate to the next tier.
40	Resources not available	<p>No available internal resources to service switch or adjunct request. System transaction capacity for adjunct or switch is exceeded.</p> <ol style="list-style-type: none"> 1. Re-engineering of adjunct services may be required. If problem persists, escalate problem to the next tier.
63	Service or Option Not Available	<p>Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resources. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct.</p> <ol style="list-style-type: none"> 1. Verify that no overlapping administration of switch resources (e.g., requesting notifications on a single domain by multiple adjuncts or multiple adjuncts attempting to control a single call) exists across all adjuncts connected to the switch. If overlaps exist, then readminister the adjuncts to guarantee that each adjunct is associated with a unique set of switch resources. 2. If Step 1 does not resolve the problem, escalate to the next tier.

Continued on next page

Table 10-143. ASAI Cause Values — *Continued*

Code	Explanation	Recommendation
	Service or Option Not Implemented	
79	Service or Option Not Implemented	Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct. <ol style="list-style-type: none">1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Readministration of the switch-administered capabilities (see Customer Optional Feature Form) or those of the adjunct may be necessary to correct the problem.2. If Step 1 does not provide the set of desired services due to deficient implementation, escalate the problem to the next tier.
	Switch Error Conditions	
87	Internal Switch Audit	There is an inconsistency in switch data records. <ol style="list-style-type: none">1. There is no action needed since the switch has corrected the data inconsistency.2. If a number of these errors continue to occur, then escalate to next tier.

- m. Certain ISDN-BRI cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3968, then the ISDN-BRI cause code is equal to the error type minus 3968. This code was sent to the endpoint by the switch.

If the error type is less than 3968, then the ISDN-BRI cause code is equal to the error type minus 3840. This code was sent to the switch by the endpoint.

A description of the various ISDN-BRI cause values is contained in Table 10-65. This table also contains recommended system technician actions associated with the cause value. Further information can also be found in the Lucent ISDN-BRI Specification (801-802-100). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

- n. Error 3847 indicates that sets on the port do not support level 3 initialization. Consult the Set Service documentation
- o. For the Error 2567 indicates that the version of ASAI is not supported, check version of the software running on the ASAI or Lucent adjunct.
- p. For Error 2568 indicates that the adjunct id is invalid, check the vender id or software running on the Lucent adjunct.

Table 10-144. ISDN-BRI Cause Values

Code	Explanation	Recommendation
1	<p>Channel in Use</p> <p>SWITCH RESOURCES NOT AVAILABLE</p>	<p>Requested channel is in use by another station on the BRI-PORT. (Not applicable for ASAI or Lucent adjuncts.)</p> <p>For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Try to originate a call to or from this port. 2. If the error persists, busy out and release the port. 3. If the problem still persists, replace stations on the port. 4. If the problem still persists, escalate to the next tier.

Continued on next page

Table 10-144. ISDN-BRI Cause Values — Continued

Code	Explanation	Recommendation
34	No circuit or channel available	<p>A resource on the switch is unavailable for a call. For BRI endpoints: This cause value is not logged. For ASAI or Lucent Adjuncts: This condition means that there are no available trunks for an outgoing call request.</p> <ol style="list-style-type: none"> 1. Verify that the adjunct is administered to support the trunk capabilities of the switch. 2. Investigate trunk group status by issuing status trunk commands from the SAT or by requesting a trunk group query or queries from the adjunct. 3. Perform trunk diagnostic procedures outlined in this manual. 4. If step 3 does not resolve the problem, escalate to the next tier.
42	Switch Equipment Congestion	<p>Switch takes control to limit received traffic. For BRI endpoints: This cause value is not logged. For ASAI or Lucent Adjuncts:</p> <ol style="list-style-type: none"> 1. See CallVisor protocol reference manual. 2. If step 1 does not resolve the problem, escalate to the next tier.

Table 10-144. ISDN-BRI Cause Values — *Continued*

Code	Explanation	Recommendation
50	Requested Facility Not Subscribed	<p>Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. For BRI endpoints:</p> <ol style="list-style-type: none"> 1. Verify the switch administration of endpoint using either the display station or display data-module commands. 2. If Step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. 3. If Step 2 does not resolve the problem, escalate to the next tier. <p>For ASAI adjuncts:</p> <ol style="list-style-type: none"> 1. Display the Customer Optional Features Form (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. 2. Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then readminister the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct. 3. If Step 2 does not resolve the problem, escalate to the next tier. <p>For Lucent adjuncts:</p> <ol style="list-style-type: none"> 1. Display the Customer Optional Features Form (administration screen) on the switch to determine if the Lucent adjunct is set enabled on in the switch. 2. If error type 2567 or 2568, verify the Lucent adjunct version, and readminister if needed. 3. If step 2 does not fix the problem, escalate to the next tier of support.
58	Bearer Capability Not Presently Available Service or Option Not Implemented	<p>Requested bearer capability is implemented, but not administered. No B-channel administered. See recommendation 50 above.</p>

Table 10-144. ISDN-BRI Cause Values — Continued

Code	Explanation	Recommendation
65	Bearer Service Not Implemented	Requested service not implemented in switch or endpoint.
69	Requested Facility Not Implemented	Requested service not supported in switch or endpoint. 1. Consult switch and endpoint documentation to determine service support. 2. If Step 1 does not resolve the problem, escalate to the next tier.
ADJUNCT/SWITCH ERROR CONDITIONS		
81	Invalid CRV	An invalid CRV was sent by the adjunct. 1. This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual. 2. If step 1 does not resolve the problem, escalate to the next tier.

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system and deciding which ones to address, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When all circuit pack and port errors have been cleared, and errors still exist against the endpoint, always investigate errors in the order they are presented in the table below. By clearing error codes associated with the *Signaling Link Status Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-145. System Technician-Demanded Tests: BRI-SET

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Signaling Link Status Test (#626)	X	X	ND
BRI XID Test (#628)	X	X	ND
BRI Layer 3 Query (#629)	X (a)	X (a)	ND

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
BRI Remote Loop Back (#627)		X (a)	ND
BRI Set Audits (#630)	X (a)	X (a)	ND
BRI Vendor ID Test (#631)		X (a)	ND
BRI Model/Vintage ID Test (#632)		X (a)	ND

¹ D = Destructive, ND = Non-destructive

Note:

- a. Will execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is “bound” to an endpoint and fails if the link is “not bound.”

The definition of the term “bound” for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of “bound” for each type of endpoint is as follows:

- **BRI endpoints administered for MIM (management information messages) initialization (multipoint):**

⇒ NOTE:

An MIM is a level 3 message that conveys management and maintenance information between a communications system and a BRI terminal.

For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 and the link has been associated with an endpoint, [that is, the endpoint has completed SPID initialization (L3 established)].

- **ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):**

For endpoints of this type, the signaling link is “bound” when the link is connected at Layer 2 (L2 established).

For all endpoint types, a signaling link becomes “unbound” when it is disconnected at Layer 2. For BRI endpoints supporting MIM initialization, a

signaling link may also become “unbound” if a subsequent attempt to perform SPID initialization on a “bound” link fails, (that is, wrong SPID is entered into the endpoint by the user).

Table 10-146. TEST #626 Signaling Link Status Test

Error Code	Test Result	Description/ Recommendation
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. 1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If Step 1 does not resolve the problem, escalate to the next tier.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Table 10-146. TEST #626 Signaling Link Status Test — Continued

Error Code	Test Result	Description/ Recommendation
1187	ABORT	<p>The circuit pack, port or station may have been busied out by a technician.</p> <ol style="list-style-type: none"> 1. Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. 2. If this error type is present for BRI-SET only, then release the station via the release station command. <ol style="list-style-type: none"> a. If this error type is present for BRI-PORT and BRI-SET, then release the port via the release port PCSSpp command and run the test again. b. If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via the release port PCSSpp command and run the test again. If the error is present for BRI-SET only, then release the circuit pack via the release port PPCSS command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via the release board PPCSS command and run the test again. <p style="text-align: center;">⇒ NOTE: When you release the circuit pack, you release all ports associated with it. If certain ports still need to be busied out, use the release port PCSSpp command to busy them out.</p> <ol style="list-style-type: none"> 3. Make sure the terminal is connected. 4. Retry the command at 1-minute intervals a maximum of 5 times. 5. If the test continues to abort, escalate the problem.
2012	ABORT	Internal System Error.
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-146. TEST #626 Signaling Link Status Test — Continued

Error Code	Test Result	Description/ Recommendation
1113	FAIL	<p>The signaling link is not "bound" to the adjunct or endpoint. For BRI endpoints supporting MIM initialization, this error indicates that the endpoint has not been bound to a signaling link (that is, SPID initialization has not been completed). Since the signaling link associated with the endpoint is not identified until SPID initialization completes, this error does not imply that the signaling link is connected or disconnected at Layer 2 nor does it provide the status of TEI assignment for the endpoint. For ASAI adjuncts and BRI endpoints not supporting MIM initialization, this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified via administration, the link is only "unbound" from the endpoint when it is disconnected.</p> <ol style="list-style-type: none">1. Execute the status bri-port PCSSpp command and refer to the associated procedures for this command contained in the BRI-PORT (ISDN-BRI Port) Maintenance documentation.
	PASS	<p>The signaling link is connected at Layer 2 and "bound" to the BRI endpoint or ASAI adjunct.</p>

BRI Remote Loop Back Test (#627)

This test checks the integrity of a circuit switched B-channel connection between the switch and the endpoint.

In this test, the endpoint is put in the "maintenance busy" state to prevent the switch from issuing calls to the endpoint during the test. An application message containing a loop back activate request for the appropriate B-channel is sent to the endpoint. The endpoint responds with a loop back activated response. Maintenance then sends data to the endpoint over the B-channel under test. Since the B-channel is looped back at the endpoint, maintenance should receive the data that it sent. If no data is detected, the test fails. An application message containing a loop back deactivate request is then sent to the endpoint to terminate the remote loop back test. The endpoint responds with an MIM message containing a loop back deactivate response. Maintenance then releases the endpoint so that it is available to terminate calls.

This test is not executed for ASAI adjuncts because adjuncts do not support MIMs upon which this test is based.

Table 10-147. TEST #627 BRI Remote Loop Back

Error Code	Test Result	Description/ Recommendation
1000	ABORT	Could not seize the endpoint or B-channels for test. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	The endpoint's MIMs Supported field is administered to "no." <ol style="list-style-type: none">1. Use the change station extension command to change parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1113	ABORT	The signaling link between the switch and the endpoint is down. <ol style="list-style-type: none">1. Use the test port PCSSpp long command to clear any errors which prevent establishment of the signaling link.2. Examine the results of the Signaling Link Status Test (#626) which is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626.3. If the XID Test #628 continues to abort, escalate the problem.
1139	ABORT	The Packet Bus in the port network is out-of-service. <ol style="list-style-type: none">1. Follow the repair procedures for the Packet Bus.2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. <ol style="list-style-type: none">1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation.2. If Step 1 does not resolve the problem, escalate to the next tier.
1144	ABORT	The PPN Packet Bus is out-of-service. <ol style="list-style-type: none">1. Follow the repair procedures for the Packet Bus in the PPN.2. If the error is present for BRI-SET only, then release the circuit pack via the release port PCSSpp command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via the release board PPCSS command and run the test again. <p> NOTE: When you release the circuit pack, you release all ports associated with it. If certain ports still need to be busied out, use the release port PCSSpp command to busy them out.</p> <ol style="list-style-type: none"> 3. Make sure the terminal is connected. 4. Retry the command at 1-minute intervals a maximum of 5 times.
2012	ABORT	Internal System Error.
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	FAIL	<p>The XID-RESPONSE message was not received from the endpoint.</p> <ol style="list-style-type: none"> 1. Consult the endpoint documentation to determine if the Layer 2 XID and XID-RESPONSE messages are supported. If the documentation reflects no support for these messages, change XID Testing? field to "no" using the change station extension command. 2. If the endpoint supports these Layer 2 messages and the test continues to fail, assume the endpoint is defective and replace it.
	PASS	The switch can successfully pass messages over the D-channel to the BRI endpoint.

BRI Layer 3 Query Test (#629)

This test is used to check the application layer communications between the switch and the endpoint or adjunct.

For BRI endpoints, an application message containing the appropriate endpoint service state is sent by the switch to the endpoint. The endpoint responds with an acknowledgment to the application message.

For ASAI and Lucent adjuncts, this test is not executed from the administration terminal. Rather, a query message is automatically sent by the switch every two minutes. Failure of the switch to receive a response to a query from the adjunct is logged in the Hardware Error Log.

Table 10-149. TEST #629 BRI Layer 3 Query

Error Code	Test Result	Description/ Recommendation
1005	ABORT	The endpoint's MIMs Supported? field is administered to "no." 1. Use the change station extension command to change the parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1113	ABORT	The signaling link between the switch and the endpoint or adjunct is down. 1. Use the test port PCSSpp long command to clear any errors which prevent establishment of the signaling link. 2. Examine the results of Test #626, which is executed with the command. If this test aborts or fails, follow the repair procedure for the Signaling Link Status Test. 3. Escalate problem if BRI Layer 3 Query Test continues to abort.
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. 1. Consult the repair procedure for PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. After completing Step 1, execute the test port long PCSSpp command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

2069	ABORT	<p>The endpoint has returned an error response to the switch sent application message.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-149. TEST #629 BRI Layer 3 Query — Continued

Error Code	Test Result	Description/ Recommendation
2000	FAIL	No response is received from the endpoint or the adjunct. For BRI endpoints: <ol style="list-style-type: none">1. Consult the endpoint documentation to determine if ISDN-BRI Management and Maintenance Procedures are supported. If not supported, use the change station extension command to change the "MIMs Supported?" field to "no." Use the busyout station extension and release station extension commands to busyout and release the endpoint to resolve any endpoint alarms resulting from failure of this test.2. If the endpoint supports these procedures and the test continues to fail, assume the endpoint is defective and replace it.
	PASS	The endpoint has successfully responded to the switch's application message.

BRI Set Audits Test (#630)

This is a series of two tests which are classified as audits. The switch sends messages to the BRI endpoint to perform the following tests:

- Ringer Audit - This audit ensures that both the switch and the endpoint agree as to the current state of the endpoint's ringer.
- Lamps Audit - This audit ensures that both the switch and the endpoint agree as to the current state of the endpoint's lamps.
- Call Activity Audit - This audit ensures that the state of calls is consistent between the switch and the endpoint.

This test is not executed for ASAI or Lucent adjunct because adjuncts do not employ ringers or lamps, or establish calls on the B-channels associated with the BRI interface.

Table 10-150. TEST #630 BRI Set Audits

Error Code	Test Result	Description/ Recommendation
1113	ABORT	The signaling link between the switch and the endpoint is down. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
2012	ABORT	Internal System Error.
2100	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

SPID Facility Test

This test is used to verify the wiring and operation of the signaling link between the switch and a endpoint or adjunct on a BRI interface. **This test is not executed from the administration terminal, but rather is executed by using a BRI test set equipped with a display.** The test set may replace the BRI set, ASAI or Lucent adjunct under test by plugging it into the same jack or by bridging it onto the wiring at some point between the switch and the endpoint (or adjunct), thereby creating a pseudo-BRI multipoint configuration.

When plugged into the port in this manner, the test set establishes a signaling link connection with the switch and attempts to complete SPID initialization by using the Service SPID administered for the system (see the System Maintenance Administration Form). If the test set displays the correct

administered port address for the endpoint or adjunct under test, the test passes (see Service SPID Display which follows). If after one minute nothing is displayed on the test set, the test fails.

Table 10-151. SPID Facility Test

Test Result	Description/ Recommendation
FAIL	No response is received from the endpoint. 1. Check the physical wiring between the switch and the endpoint or adjunct.
FAIL	Display does not match administered port address for the endpoint or adjunct. 1. Change station administration for endpoint or adjunct to match displayed port address.
PASS	Display matches administered port address for the endpoint or adjunct. For BRI endpoints: 1. Verify that the SPID values administered in the switch and the endpoint are consistent. 2. If the SPID values are correct, replace the endpoint. 3. If test continues to fail, escalate the problem. For ASAI adjuncts: 1. Verify that the TEI values administered in the switch and the adjunct are consistent. 2. If the TEI values are correct, consult the recommended repair procedures of the manufacturer for the adjunct.

The abbreviations used in (Service SPID Display) have the following meanings:

- P port network (1,2, ...)
- C Carrier (A,B,C, ...)
- SS Slot (01, 02, ...)
- pp port (01-12)
- ext extension one and two (one through 99999)
- SPID service order profile identifier

CABINET (Cabinet Sensors)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CABINET	MAJOR	test environment P	Cabinet Sensors
CABINET	MINOR ²	test environment P	Cabinet Sensors

- 1 Where P is an appropriate port network number determined via the Port field from the Alarm or Error Log.
- 2 If a minor alarm occurs for a variable speed fan, the fan should be checked for a dirty filter. If the filter is not dirty, the fan should be replaced.

**NOTE:**

CABINET is valid only in a multicarrier cabinet system. For information concerning single-carrier cabinet systems, refer to the DC-POWER (Single-Carrier Cabinet Power) Maintenance documentation.

Each multicarrier cabinet is equipped either with six non-variable speed fans or with six variable speed fans.

Non-Variable Speed (Standard) Fan Option. A non-variable speed (standard) fan is indicated by one of the following Product Codes: "ED67077 G1," "ED67077 G2," or "ED67077 G3." Multicarrier cabinets with non-variable speed fans contain a fan speed control unit known as the AHD1 circuit pack. This circuit pack is designed to keep the temperature within the cabinet below 65⁰ C (149⁰ F). Air is drawn in by the three fans located in the front of the cabinet. The air is channeled upwards through a filter, then through carriers A, B, and C and out the top of the cabinet. Air is drawn in by the three fans located in the back of the cabinet as well. The air is channeled down through a filter, then through carriers D and E and out the bottom of the cabinet. The AHD1 circuit pack monitors five of the six temperature sensors located throughout the multicarrier cabinet, and it uses the output of these sensors to adjust fan speed and to report air flow problems. The Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack, a PPN for a High or Critical Reliability system, and the EPN Maintenance circuit pack in an EPN multicarrier cabinet system directly monitor the sixth sensor (S1) to report temperature problems. The Cabinet Sensors maintenance object represents the air flow and temperature problems reported by the AHD1 circuit pack and by the Maintenance/Tape Processor, the Duplication Interface circuit pack, or the EPN Maintenance circuit pack in the multicarrier cabinet systems.

The fans and the AHD1 circuit pack obtain their power from the -48 volt DC power supply of the 631 DB DC power unit in the A carrier. In a PPN cabinet for a High or Critical Reliability system, the 631 DB DC power unit in the B carrier can also provide power to the fans. The power goes from the power unit(s) to the current limiter card (982LS), over a wiring harness from the A carrier to the back of the fan unit, through the AHD1 circuit pack, and then to the fans. The front fans

are wired in parallel with a rear fan. The repair scenarios that follow rely on the technician's ability to distinguish between high fan speed and low fan speed. The only way to distinguish between the fan speeds is by the sound of the fans. When operating at high speed, the fans make a higher pitched sound than when they run at low speed. The technician probably knows from prior experience what the fans sound like at low speed as well as at high speed.

Figure 10-20 shows a multicarrier cabinet system and the location of the temperature sensors S1 through S4 (there are actually two S3 sensors and two S4 sensors) as well as the location of the fans, the AHD1 circuit pack, and the filters. The figure also shows other environment-related components of a multicarrier cabinet system and can be ignored for this section on Cabinet Sensors.

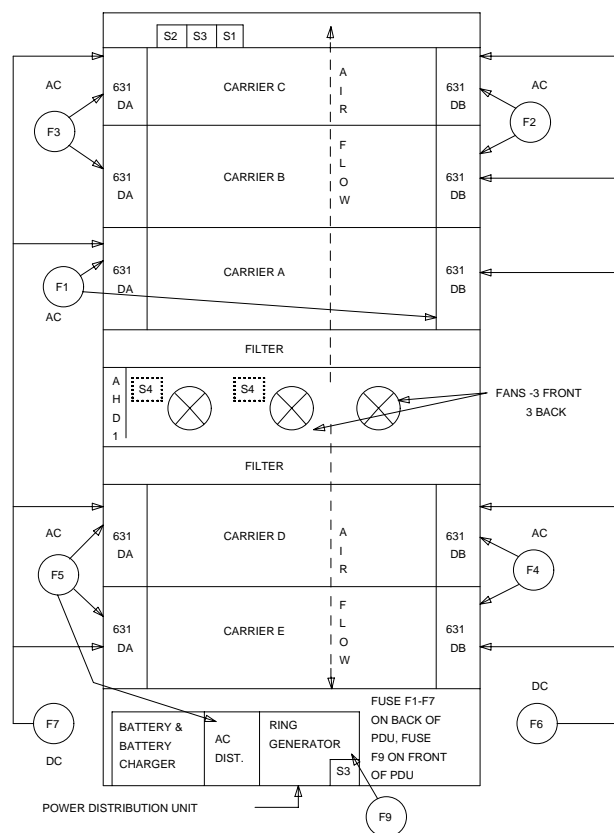

Figure 10-20. Multicarrier Cabinet Environment Components (CABINET)
 [Non-Variable Speed Fan Option]

Sensor S1 informs the Maintenance/Tape Processor, the Duplication Interface circuit pack, or the EPN Maintenance circuit pack when the temperature at the top of the cabinet reaches 65⁰ C (149⁰ F). Sensor S2 is not monitored by any circuit pack. However, when the temperature at the top of the cabinet reaches 70⁰ C (158⁰ F), this sensor causes the Power Distribution Unit to shut down power to the entire cabinet. At this point, Emergency Transfer is invoked, and no other system functions are provided.

The S3 and S4 sensors constantly report the temperature at the air exhaust in the cabinet (top and bottom S3 sensors) and at the air intake (S4 sensors). The AHD1 circuit pack uses this information to determine fan speed and air flow alarm state. If there is at least a 15⁰ C (27⁰ F) air temperature difference between the air exhaust and air intake, **and** if the air exhaust temperature is greater than 50⁰ C (122⁰ F), all the fans are turned up to high speed. If this condition exists, the AHD1 circuit pack reports an air flow problem which results in a Minor alarm against the Cabinet Sensors.

Variable Speed Fan Option. A variable speed fan is indicated by the Product Code "ED67077 Gx," where x is 4 or a number greater than 4. A variable speed fan contains Thermal Speed Control and an alarm circuit. As a result, the AHD1 circuit pack is not required in this type of fan.

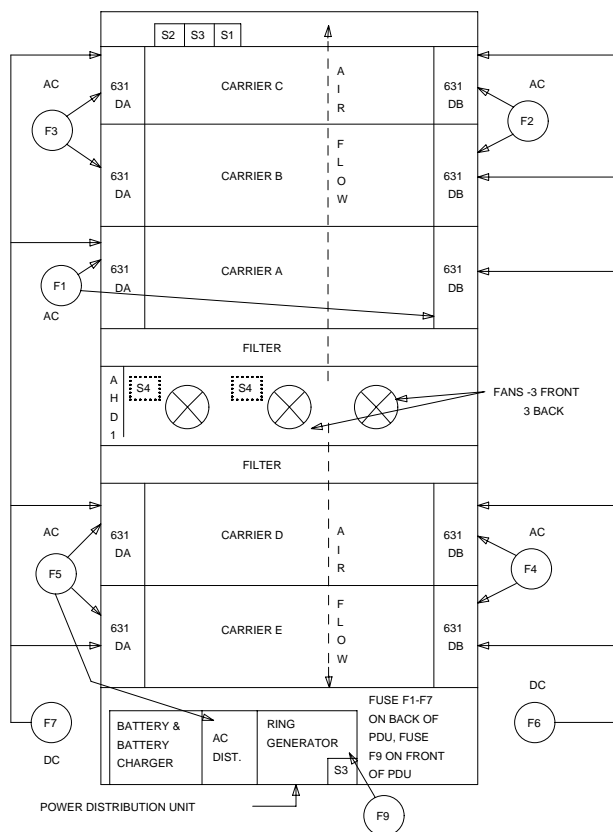

A variable speed fan has two connectors: a two pin connector for the -48 volt input power for backward compatibility, and the five pin Molex connector for speed control and alarm circuitry. The -48 volt power circuitry is isolated from the speed control and the alarm circuitry.

An alarm lead from all six variable speed fans is tied to a single lead leading to the processor circuit pack. Three fans on the front of the system are connected to an S3 sensor, which monitors the exhaust air temperature above carrier position "C." Three fans on the back of the system are connected to another S3 sensor, which monitors the exhaust air in the power distribution unit. The speed of the variable speed fans is determined by the temperature detected by the S3 sensors. Thus, the fans' speed changes continuously according to the temperature of the exhaust air. If the fan speed drops below the preset limit, or if the fan fails, the fan alarm circuit reports an air flow problem, which results in a minor alarm.

A multicarrier cabinet containing variable speed fans is presented in [Figure 10-21](#). Note that the two S4 sensors that are included with non-variable speed fans are not required with variable speed fans.

 **NOTE:**

The new variable speed fans are backward compatible to the carriers for the non-variable speed fans. However, the carriers for the variable speed fans are not backward compatible to cabinets configured for the carriers for the non-variable speed fans. Finally, the carriers for the non-variable speed fans are not forward compatible to cabinets configured for the carriers for variable speed fans.

**Figure 10-21. Multicarrier Cabinet Environment Components (CABINET)
 [Variable Speed Fan Option]**

Replacement Procedures for AHD1 Fan Speed Controller Circuit Packs and Fans

AHD1 Fan Speed Controller Circuit Pack Replacement Procedure

NOTE:

The procedures in this section pertain only to non-variable speed (standard) fans.

1. Refer to Chapter 5, "Routine Maintenance Procedures", for details on removing power from the system.
2. Remove the fan assembly cover by pulling the cover outward.
3. Loosen and remove the retaining screw nearest the power plug on the front fan located to the extreme left.
4. Disconnect the power plug from the fan.
5. Loosen and remove the other retaining screw on the fan.
6. Remove the fan from the fan assembly.

CAUTION:

DO NOT TOUCH! Resistors on the circuit pack are hot.

7. Lift the latch on the AHD1 fan speed controller circuit pack.
8. Using the latch as a handle, pull the circuit pack up and out of its holder.
9. Insert a replacement AHD1 circuit pack, and push down on the latch until the latch snaps in place.
10. Position the fan, and reconnect the fan power plug.
11. Insert and tighten the retaining screws.
12. Replace the fan assembly cover.
13. Refer to Chapter 5, "Routine Maintenance Procedures", for details on restoring power to the switch.

Fan Replacement Procedure

NOTE:

The procedures in this section pertain to both non-variable speed (standard) fans and variable speed fans.

First, determine which fans are defective:

NOTE:

The following instructions are for servicing a Medium Cabinet. For a Small Cabinet (only two fans in the rear), follow Step 2A below, but start from the rear of the cabinet.

1. If any fan is **not** rotating, a more detailed inspection is required to determine why the fan has stopped operating. The fact that a fan is not spinning is not always proof that it is damaged. Since each front fan is electrically in parallel with a rear fan, an internal short circuit in a front fan prevents power from reaching the rear fan (and vice versa).

Remove the fan assembly cover by pulling the cover outward. Remove the power connector from each inoperative front fan.

2. The following must be done to determine if the front fan or the rear fan has failed:

- a. Test the front fan:

Measure the input impedance between the (+) and (-) input terminals of the front fan with an ohmmeter. **IMPORTANT: Attach the “common” lead of the ohmmeter to the fan’s (-) input terminal and the “ohms” or (+) lead of the ohmmeter to the fan’s (+) input terminal.**

Follow the guidelines in the table below:

Input Impedance	Fan Analysis	Action	Next Step
2.0M < ohms < 20M	Good	None	Go to Step 2B
ohms < 2.0M	Short Circuit	Replace	Go to Step 3
ohms > 20M	Open Circuit	Replace	Go to Step 3

- b. Test the “paired” rear fan:

From the front of the cabinet, use a voltmeter to measure the DC voltage across the two female contact pins in the connector housing of the fan wire harness removed from the inoperative front fan in Step 1. (This voltage is the same voltage seen across the input terminals of the paired fan in the rear of the assembly.)

Follow the guidelines in the table below:

Input Impedance	Fan Analysis	Action	Next Step
VDC > 25V	Good	(AHD1 or Front Fan failed)	
VDC < 25V	Short Circuit	Replace	Go to Step 3

3. To replace a fan located at the front of the switch cabinet, remove the fan assembly cover by pulling the cover outward. To replace a fan located at the rear of the switch cabinet, use a No. 10 slot screwdriver or 5/16-inch (8mm) wrench and remove the panel covering the fan assembly.
4. Loosen and remove the retaining screw nearest the power plug on the defective fan.

DANGER:

48-volt power is present on the fan plug.

5. Disconnect the power plug from the defective fan.
6. Loosen and remove the other retaining screw on the fan.
7. Remove the fan from the fan assembly.
8. Position the replacement fan and reconnect the fan power plug.

9. Insert and tighten the retaining screws.
10. Replace the fan assembly cover or panel.

Hardware Error Log Entries and Test to Clear Values

Cabinet Sensors Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment P sh r 1
1	Any	Cabinet Temperature Query Test (#122)	MINOR	ON	test environment P sh r 3
257	Any	Cabinet Temperature Query Test (#122)	MAJOR	ON	test environment P sh r 3

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-152. System Technician-Demanded Tests: CABINET

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78) (b)	X	X	ND
Power Unit Query Test (carrier E) (#127) (c)	X	X	ND
Power Unit Query Test (carrier D) (#127) (c)	X	X	ND
Power Unit Query Test (carrier A) (#127) (c)	X	X	ND

Table 10-152. System Technician-Demanded Tests: CABINET — Continued

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

¹ D = Destructive, ND = Non-destructive

Notes:

- a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.
- b. Refer to AC-POWER (AC-Power) Maintenance documentation for a description of this test.
- c. Refer to CARR-POW (Carrier Port Power Unit for AC- and DC-Powered Systems) Maintenance documentation for a description of this test.
- d. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.
- e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.
- f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test. This test shows up in the test sequence only if there is a TN768 Tone-Clock circuit pack in the port network being tested.

Cabinet Temperature Query Test [for Non-Variable Speed Fans] (#122)

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN for the status of the cabinet sensors in the cabinet that contains non-variable speed fans.

⇒ NOTE:

The descriptions for Error Codes 1 and 2 (FAIL) in the following table are reversed for Generic 1 systems that use a TN731B maintenance circuit pack. That is, Error Code 1 indicates an “over temperature” problem while Error Code 2 indicates an “air flow” problem. If you are servicing a Generic 1 system, be sure to follow the proper service strategy.

**Table 10-153. TEST #122 Cabinet Temperature Query Test
 [Non-Variable Speed Fans]**

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to ABORT with Error Code 2000, check for system powering problems with the A carrier (PPN or EPN). Look for and resolve all AC-POWER and CARR-POW alarms in a multicarrier cabinet system or DC-POWER alarms in a single-carrier cabinet system. Then, repeat the test. 3. If the test continues to ABORT with a Error Code 2000, check for and resolve all DUPINT (Duplication Interface) errors in a Duplicated Option PPN, PR-MAINT (Maintenance/Tape Processor) errors in a standard PPN, or MAINT (EPN Maintenance circuit pack) errors in an EPN. Then, repeat the test. 4. If the test continues to ABORT with a Error Code 2000, escalate the problem.
2029	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

**Table 10-153. TEST #122 Cabinet Temperature Query Test
 [Non-Variable Speed Fans] — Continued**

Error Code	Test Result	Description/ Recommendation
1	FAIL (cont'd.)	<p>6. At this point, there should be nothing impeding the air flow, and the fans should be running at high speed. Check the temperatures for the 15⁰ C/50⁰ C criteria.</p> <ol style="list-style-type: none"> a. If the 15⁰ C/50⁰ C criteria exists, a temperature problem exists, and the fans (at high speed) should cool down the cabinet. Wait five minutes and rerun the test. If the test still fails, the ambient room temperature is probably too high, and the room should be cooled. b. If the 15⁰ C/50⁰ C criteria does not exist, the AHD1 circuit pack, the fans, or the S3 or S4 sensors are defective. Replace these items one at a time (in the order listed). Rerun the test between each replacement. Failures can occur on the Maintenance/Tape Processor, the Duplication Interface, and the EPN Maintenance circuit pack that are not detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If this does not clear the problem, follow normal escalation procedures.
2	FAIL	<p>The PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack has reported a temperature problem because the S1 sensor has detected a temperature of at least 65⁰ C (149⁰ F). The entire cabinet is in danger of being powered down if the temperature reaches 70⁰ C (158⁰ F).</p> <ol style="list-style-type: none"> 1. If none of the fans are running: <ol style="list-style-type: none"> a. Look for and resolve all alarms against the CARR-POW (Carrier Port Power Unit). b. Verify that 48 volt DC is available to the fan units. Check the fan unit wiring harness connector. Verify that there is 48 volt DC between pins (3, 9, 11 and 2, 8, 10). <ul style="list-style-type: none"> ■ If there is 48 volt DC at the connector, there should be power to the fans. If the fans are not running, replace the AHD1. If the fans still do not run, follow normal escalation procedures. ■ If there is not 48 volt DC at the connector, the current limiter card (982LS) is probably defective. Replace the current limiter card. If the fans still do not run, escalate the problem. 2. If only a few of the fans are not running, replace the defective fans. 3. If all the fans can be started, wait five minutes, and rerun the test. If the test fails again, proceed to Step

Continued on next page

Table 10-153. TEST #122 Cabinet Temperature Query Test
[Non-Variable Speed Fans] — Continued

Error Code	Test Result	Description/ Recommendation
2	FAIL (cont'd.)	4. Check the temperature at the top of the cabinet. If the temperature is at least 65 ⁰ C (149 ⁰ F), the ambient room temperature is too high, and the fans cannot cool the system. Unless the room temperature is reduced, the system is going to shut down soon. If the temperature is less than 65 ⁰ C, then: 5. The PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may be incorrectly reporting this condition. a. First, look for and resolve all errors on these MOs, then rerun the test. b. If this test fails again, go to Step 6. 6. The sensor S1 may be incorrectly reporting the temperature at the top of the cabinet. Replace sensor S1, and rerun the test. If the test still fails, escalate the problem.
3	FAIL	The AHD1 circuit pack has reported both air flow and temperature problems. Resolve the airflow error first, then, correct the temperature error as described previously.
	PASS	The AHD1 circuit pack has not reported any temperature or air flow problems. The temperatures at the air exhaust at the top of the cabinet and the air intake at the bottom of the cabinet can be measured and the results compared against the criteria described previously. If a problem has been reported, troubleshoot this problem by using the procedures for the "FAIL" cases described previously.

CAP-MEM (Memory Card Capacity)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CAP-MEM	MINOR/ WARNING ¹	test card-mem long	Memory Card Capacity

- 1 Downgrading the MINOR alarm (**set option**) generates the WARNING alarm.

Memory Card Capacity tracks the percentage of translation storage space the memory card uses. When the memory card fills 98% of its translation space, the switch generates an alarm to inform users that they may require a larger system flash card.

Error Log Entries and Test to Clear Values

Table 10-154. Memory Card Capacity Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	112	Memory Card Capacity Test (#1014)	MINOR/ WARNING (b)	OFF	test card-mem long

Notes:

- a. The memory card translation storage space is at least 98% full.
- b. This alarm has been downgraded (**set option**).

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
12-Volt Power Supply Test (#701) (a)	X	X	ND
Memory Card Insertion Test (#695) (b)	X	X	ND
Memory Card Format and Read Test (#696) (b)	X	X	ND
Memory Card Match Test (#697) (b)	X	X	ND
Memory Card Write-Protected Test (#698) (b)	X	X	ND
Memory Card Directory Recovery Test (#699) (b)	X	X	ND
Memory Card Translation Data Integrity Test (#694) (b)		X	ND
Memory Card Erase/Write/Read Test (#693) (b)		X	ND
Memory Card Capacity Test (#1014)		X	ND

¹ D = Destructive; ND = Nondestructive

Notes:

- a. Refer to 12V-PWR (12-Volt Power Supply) Maintenance documentation for a description of this test.
- b. Refer to CARD-MEM (Memory Card) Maintenance documentation for a description of this test.

Memory Card Capacity Test (#1014)

This nondestructive test verifies that the memory card is using less than 98% of its translation storage space.

This test runs

- during periodic and schedule maintenance
- on demand (**test card-mem long, save translation**).

Table 10-155. TEST #1014 Memory Card Capacity Test

Error Code	Test Result	Description/ Recommendation
112	ABORT	Memory Card Translation storage at least 98% full. 1. Inform the user of possible need to upgrade to larger flash card. 2. Replace the memory card with a larger one, or downgrade the alarm to WARNING (set option). 3. Rerun the test.
2012 2106 2114	ABORT	Internal System Error 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100	ABORT	Could not locate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times
2110	ABORT	Memory card not present. 1. Insert formatted memory card into TN794 or TN777B circuit pack slot. 2. Retry the command at 1-minute intervals, up to 5 times.
	PASS	The Memory Card Translation storage is less than 98% full.

CARD-MEM (Memory Card)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CARD-MEM	MAJOR ¹		Memory Card
CARD-MEM	MINOR	test card-mem long	Memory Card
CARD-MEM	WARNING	test card-mem sh	Memory Card

- 1 The "MAJOR" alarm occurs only at power-up time or on a Reset System 3, 4, or 5 when the switch cannot load all translations from the memory card.

A memory card contains a set of flash EPROM memory devices. The memory card stores data that can remain nonvolatile, even when the power is off. The memory card is on the TN777B Netcon and TN794 NetPkt circuit pack to save

- Translations
- Announcements
- Core dumps
 - Saves maintenance hardware error logs
 - LMM applies update file to in-core system software.

The memory card does not contain a copy of the system software.

The recommended size of a memory card for each configuration is described in the following table.

Memory Card Size	Usage	File Names
1 Megabyte	Without Announcements	translation
4 Megabyte (Standard)	With Announcements	translation announcements
10 Megabyte	With Announcements	translation announcements
10 Megabyte	Maintenance	translation announcements core_dump
10 Megabyte	System Upgrade	system_software
10 Megabyte	DEFINITY Wireless Business System, or Test #1014 error on 4 Megabyte card	

A memory card has a write-protect switch along its edge. The switch enables or disables write-protection.

If the 12-Volt power supply unit does not supply 12-Volts, all erase and write operations fail. Refer to 12V-PWR Maintenance documentation.

Software erase and write operations on a memory card take longer as the card usage increases. Replace memory cards that software cannot erase or write to.

Resolving memory card alarms

NOTE:

To avoid corrupting files, only remove a memory card when the yellow “Card-in-use” LED is not glowing.

Follow this list to resolve an alarm on a memory card:

1. Ensure that the “card-in-use” amber LED is out.
2. Remove the memory card from the Processor circuit pack slot.
3. Insert a new, formatted memory card firmly into Processor circuit pack slot.
4. Verify new memory card (**test card-mem**).
5. If the alarm persists, replace the circuit pack.
6. Insert new, formatted memory card firmly into the new Processor circuit pack slot.
7. Verify new circuit pack and memory card (**test network-control [long]**).
8. If the alarm resolves, store current system translations and announcements (if applicable) to the memory card (**save translation** and **save announcements**, respectively).

Error Log Entries and Test to Clear Values

Table 10-156. Memory Card Error Log Entries

Table 10-156. Memory Card Error Log Entries — Continued

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3841(i)	Any	Save Translation	MINOR	OFF	save translation
3843(j)	Any	Save Translation	MINOR	OFF	save translation

1 Run the Short Test sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

- a. **Error Type 1:** System detects no memory card in the slot of the TN794 NetPkt or TN777B Netcon circuit pack. If memory card is in place, it may have a bad physical connection.
- b. **Error Type 257:** System software cannot recognize memory card because the memory card is not formatted or is corrupted. Replace memory card.
- c. **Error Type 513:** Not enough memory to support system operations, or memory card is a system-upgrade memory card, which cannot save translations.

If the memory card:	Then the switch:
Is a system-upgrade memory card,	Raises an off-board WARNING.

Aux Data:

- 101 System-upgrade memory card.
- 102 Uses announcement feature, without available announcement file.
- 103 System-upgrade memory card, and uses announcement feature without available announcement file.
- 116 Memory card capacity does not match system configuration.
- 118 Uses announcement feature without available announcement file, and memory card capacity does not match system configuration.
- 132 System translation reaches 98% capacity.
- 134 Uses announcement feature without available announcement file, and system translation reaches 98% capacity.
- 148 Memory card capacity does not match system configuration, and system translation reaches 98% capacity.

150 Uses announcement feature without available announcement file, memory card capacity does not match system configuration, and system translation reaches 98% capacity.

- d. **Error Type 769:** Write-protect switch in the “protected” position.
 - 4. Ensure that the “card-in-use” amber LED is not glowing.
 - 5. Remove the memory card from the Processor circuit pack slot.
 - 6. Push write-protect switch into “not protected” position.
 - 7. Insert memory card firmly into Processor circuit pack slot.
- e. **Error Type 1025:** Maintenance cycle detects broken directory in memory card.

If the maintenance cycle:	Then the switch:
Detects a broken directory,	Raises an off-board MINOR alarm.

- 1. Ensure that the “card-in-use” amber LED is not glowing.
- 2. Remove the memory card from the Processor circuit pack slot.
- 3. Insert new memory card firmly into Processor circuit pack slot.
- 4. Verify new memory card (**test card-mem**).

Aux Data:

- 104 Memory card directories are corrupt and irrecoverable.
- 105 Cannot write “0” into memory card before an erase operation.
- 106 Cannot erase memory card.
- 107 Cannot write data into a memory card after an erasure.
- 108 Cannot turn on 12-Volt power supply for directory recovery.

- f. **Error Type 1281:** The memory card can no longer hold the written data, due to corrupt translations file.
 - 1. Restore translations (**save translation**).
 - 2. Clear the alarm (**test card-mem long**).
 - 3. If problem persists, replace the memory card.
- g. **Error Type 1537:** The Memory Card Erase/Write/Read Test failed.
 - 1. Verify memory card is present and that write-protect switch is off (**status card-mem**).
 - 2. Verify the 12-Volt power supply is functional (**test card-mem**).
 - 3. Verify Memory Card Erase/Write/Read Test result (**test card-mem long**).

4. If problem persists, replace the memory card.
5. Resolve the alarm (**test card-mem long**).

Aux Data

Same as Note e above.

- h. **Error Type 3329:** Switch cannot load translations.

In a standard system, the alarm invokes Emergency Transfer. Follow the repair procedure for a standard system that appears below.

 **NOTE:**

If there are other memory card errors or alarms, resolve them before trying to resolve this alarm.

1. Resolve all other memory card alarms.
2. Reset the system (**reset system 3**).
3. Verify the memory card (**status card-mem**).
4. If problem persists, replace the memory card.
5. Reset the system (**reset system 3**).

- i. **Error Type 3841:** Could not save translations.

Aux Data:

- | | |
|----|--|
| 1 | Memory card directory file failed checksum test. |
| 3 | Too many commands running. |
| 4 | Command aborted. |
| 5 | Command collided with a current command. |
| 6 | Idle software controller. |
| 7 | Memory card has been erased. |
| 8 | Memory card has only one good directory. |
| 9 | All directories are corrupted, and memory card needs reformatting. |
| 10 | Hard patch file is full. |
| 11 | Cannot write to memory card due to hardware fault. |
| 12 | Parameters were out of range due to software fault. |
| 13 | Command aborted. |
| 14 | Illegal magic number. |
| 15 | Trapped driver (when reading the memory card). |
| 16 | Memory card is absent. |

- 17 Could not find second directory in the memory card.
- 18 Memory card file not available.
- 19 Memory card does not match the system usage.
- 20 Memory card too small for system usage
- 21 Could not recover broken directory.
- 22 Memory card is system upgrade card.
- 23 Request illegal write.
- 24 Generic software failure.
- 25 Driver timed out.
- 26 Cannot write "0" to the memory card.
- 27 Cannot erase memory card.
- 28 Memory card is write-protected.
- 29 Cannot turn on 12-Volt power supply.

If the "save translation" operation:	Then the switch:
Fails,	Raises an off-board MINOR alarm.
Saves into memory,	Resolves off-board MINOR alarm.

- j. **Error Type 3843:** Cannot save translations due to other hardware failures.
 1. Verify Memory Card Erase/Write/Read Test result (**test card-mem long**).
 2. Resolve all other memory card alarms, if any.
 3. When Memory Card Erase/Write/Read Test passes, resolve the error (**save translation**).

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
12-Volt Power Supply Test (#701) (a)	X	X		ND
Memory Card Insertion Test (#695)	X	X		ND
Memory Card Format and Read Test (#696)	X	X		ND

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND ¹
Memory Card Match Test (#697)	X	X		ND
Memory Card Write-Protected Test (#698)	X	X		ND
Memory Card Directory Recovery Test (#699)	X	X		ND
Memory Card Translation Data Integrity Test (#694)		X		ND
Memory Card Erase/Write/Read Test (#693)		X		ND

1 D = Destructive; ND = Nondestructive

Note:

- a. Refer to 12V-PWR (12-Volt Power Supply) Maintenance documentation for a description of this test.

Memory Card Erase/Write/Read Test (#693)

This nondestructive test verifies the erase, write, and read operations. The test also verifies translation file.

This test runs

- during test sequence if **save translation** and **save announcements** operations fail
- on demand (**test card-mem long**).

The test and relevant applications (such as **save translation** and **save announcements**) cannot run at the same time.

Table 10-157. TEST #693 Memory Card Erase/Write/Read Test

Error Code	Test Result	Description/ Recommendation
1192	ABORT	Applications are accessing the memory card. 1. Wait 10 minutes for the applications to complete. 2. Retry the command at 1-minute intervals, up to 5 times.
2012 2106 2114	ABORT	Internal system error. 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times.

Continued on next page

Table 10-157. TEST #693 Memory Card Erase/Write/Read Test — Continued

Error Code	Test Result	Description/ Recommendation
2110	ABORT	Memory card not present.
2111	ABORT	Switch does not recognize the memory card. 1. Insert a formatted memory card into the slot at the TN794 NetPkt or TN777B Netcon circuit pack. 2. Retry the command at 1-minute intervals, up to 5 times.
2112	ABORT	Memory card is a system-upgrade memory card. 1. Replace the inserted memory card with a user's memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
2113	ABORT	Memory card has only one directory file. 1. Verify the Memory Card Directory Recovery Test (#699) result (test card-mem). 2. If the problem persists, replace the memory card. 3. Retry the command at 1-minute intervals, up to 5 times.
2115	ABORT	Write-protect switch in "protected" position. 1. Remove the memory card from the Processor circuit pack slot. 2. Push write-protect switch into "not protected" position. 3. Insert memory card firmly into Processor circuit pack slot. 4. Retry the command at 1-minute intervals, up to 5 times.
2117	ABORT	Translation file not on memory card. 1. Verify memory card saves translations (save translation). 2. Retry the command at 1-minute intervals, up to 5 times.
104	FAIL	Corrupt and irrecoverable directories.
105	FAIL	Cannot write "0" to the memory card.
106	FAIL	Cannot erase memory card.
107	FAIL	Cannot write data into memory card after erasing. 1. Replace the memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
108	FAIL	Cannot turn on the 12-Volt power supply. 1. Verify 12-Volt Power Supply Test (#701) result (test card-mem). 2. If Test #701 fails, replace TN794 NetPkt or TN777B Netcon circuit pack. 3. Retry the command a 1-minute intervals, up to 5 times.

Memory Card Translation Data Integrity Test (#694)

This nondestructive test verifies the integrity of the translation file stored in the memory card through comparing checksum values. If the calculated checksum value and the recorded checksum value are different, the translation file is corrupt.

Table 10-158. TEST #694 Memory Card Translation Data Integrity Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal system error 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times.
2110 2111	ABORT ABORT	Memory card not present. Switch does not recognize the memory card. 1. Insert a formatted memory card into the slot at the TN794 NetPkt or TN777B Netcon circuit pack. 2. Retry the command at 1-minute intervals, up to 5 times.
2112	ABORT	Memory card is a system-upgrade memory card. 1. Replace the inserted memory card with a user's memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
Any	FAIL	A checksum error in translation. 1. Verify the memory card can save translations (save translation). 2. Retry the command at 1-minute intervals, up to 5 times. 3. If the problem persists, replace the memory card.
	PASS	No checksum error is found in the translation file.

Memory Card Insertion Test (#695)

This nondestructive test verifies

- whether a memory card is in the memory card slot of the TN794 NetPkt or TN777BNetcon circuit pack
- whether the system can detect the memory card.

Table 10-159. TEST #695 Memory Card Insertion Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal system error 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times.
	FAIL	Memory card is not present or has a bad connection. 1. Verify memory card is present or has good connection. 2. Insert memory card firmly into slot. 3. Verify memory card (test card-mem). 4. If problem persists, replace the memory card. 5. Verify memory card (test card-mem). 6. If problem persists, replace the TN794 NetPkt or TN777B Netcon circuit pack.
	PASS	Memory card is present, and the system detects it.

Memory Card Format and Read Test (#696)

This nondestructive test reads and verifies the integrity of the memory card directory file.

Table 10-160. TEST #696 Memory Card Format and Read Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal system error 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times.

Continued on next page

Table 10-160. TEST #696 Memory Card Format and Read Test — Continued

Error Code	Test Result	Description/ Recommendation
2110	ABORT	Memory card not present. 1. Insert a formatted memory card into the slot at the TN794 NetPkt or TN777B Netcon circuit pack. 2. Retry the command at 1-minute intervals, up to 5 times.
2113	ABORT	Memory card has only one directory file. 1. Verify the Memory Card Directory Recovery Test (#699) result (test card-mem). 2. If the problem persists, replace the memory card. 3. Retry the command at 1-minute intervals, up to 5 times.
	FAIL	System does not recognize memory card, unformatted memory card, or corrupt memory card directories. 1. Replace the memory card with a new formatted memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
	PASS	System recognizes the memory card, and can read the memory card directories.

Memory Card Match Test (#697)

This nondestructive test verifies the memory card is consistent with the system configuration. The test helps answer the following questions:

If the memory card:	Then the maintenance cycle:
Is a system upgrade memory card,	Raises a MINOR alarm.
Matches the system configuration capacity,	Raises a MINOR alarm.
Contains an announcement file for systems with announcement circuit pack,	Raises a MINOR alarm.
Reaches 98% of its reserved storage space,	Raises a MINOR alarm.

If maintenance raises a WARNING alarm for these reasons, replace the memory card.

Table 10-161. TEST #697 Memory Card Match Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal system error 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times.
2110 2111	ABORT ABORT	Memory card not present. Switch does not recognize the memory card. 1. Insert a formatted memory card into the slot at the TN794 NetPkt or TN777B Netcon circuit pack. 2. Retry the command at 1-minute intervals, up to 5 times.
101	FAIL	Memory card is a system-upgrade memory card.
102	FAIL	Memory card does not contain an Announcements file (for systems configured with the Announcement feature).
103	FAIL	System upgrade memory card, and uses announcement feature without available announcement file.
116	FAIL	Memory card capacity does not match system configuration capacity.
118	FAIL	Uses announcement feature without available announcement file, and memory card does not match system configuration.
132	FAIL	System translation reaches 98% of capacity.
134	FAIL	Uses announcement feature without announcement file in memory card, and system translation reaches a 98% capacity.
148	FAIL	Memory card capacity does not match the system configuration, and system translation reaches 98% capacity.
150	FAIL	Uses announcement feature without announcement file in memory card, memory card capacity does not match the system configuration, and system translation reaches 98% capacity. 1. Replace the memory card with a 10 MB memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
	PASS	Memory card matches the system configuration, and has enough space for saving translations and announcements (if applicable).

Memory Card Write-Protection Test (#698)

This nondestructive test verifies whether the memory card write-protection switch is on. Write-protection does not allow erasing from nor writing to the memory card when the write-protected switch is on.

Table 10-162. TEST #698 Memory Card Write-Protected Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal system error <ol style="list-style-type: none">1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals, up to 5 times.
2110 2111	ABORT ABORT	Memory card not present. Switch does not recognize the memory card. <ol style="list-style-type: none">1. Insert a formatted memory card into the slot at the TN794 NetPkt or TN777B Netcon circuit pack.2. Retry the command at 1-minute intervals, up to 5 times.
	FAIL	The Write-Protect switch of the inserted memory card is set to the protect position. <ol style="list-style-type: none">1. Remove the memory card.2. Move the write-protect switch to the "not-protected" position.3. Re-insert the memory card into the slot.4. Retry the command at 1-minute intervals, up to 5 times.
	PASS	The inserted memory card is not write-protected.

Memory Card Directory Recovery Test (#699)

All memory cards (except system software upgrade memory cards) have two copies of both directory files and translation files. This ensures the memory card has at least one good translation file in at any time, especially during the "save translation" operation. If maintenance detects that one of a pair of files is missing, maintenance can build the file.

This nondestructive test

- Verifies the integrity of active and backup directory files in a memory card

- Requests directory file rebuild, if necessary.

If the memory card:	Then the test:
Shows both directory pairs to be sane,	Passes.
Is a system-upgrade memory card,	Aborts.
Has broken or re-buildable directory pairs,	Fails and raises Error Type 1025.

Table 10-163. TEST #699 Memory Card Directory Recovery Test

Error Code	Test Result	Description/ Recommendation
1192	ABORT	Applications are accessing the memory card. 1. Wait 10 minutes for the applications to complete. 2. Retry the command at 1-minute intervals, up to 5 times.
2012 2106 2114	ABORT	Internal system error 1. Retry the command at 1-minute intervals, up to 5 times.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals, up to 5 times.
2110 2111	ABORT ABORT	Memory card not present. Switch does not recognize the memory card. 1. Insert a formatted memory card into the slot at the TN794 NetPkt or TN777B Netcon circuit pack. 2. Retry the command at 1-minute intervals, up to 5 times.
2112	ABORT	Memory card is a system-upgrade memory card. 1. Replace the inserted memory card with a user's memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
2115	ABORT	The write-protect switch is set to the protect position. 1. Remove the memory card. 2. Move the write-protect switch to the "not-protected" position. 3. Re-insert the memory card into the slot. 4. Retry the command at 1-minute intervals, up to 5 times.

Continued on next page

Table 10-163. TEST #699 Memory Card Directory Recovery Test — Continued

Error Code	Test Result	Description/ Recommendation
104	FAIL	Corrupt and irrecoverable directories.
105	FAIL	Cannot write "0" to the memory card.
106	FAIL	Cannot erase memory card.
107	FAIL	Cannot write data into memory card after erasing. <ol style="list-style-type: none"> 1. Replace the memory card. 2. Retry the command at 1-minute intervals, up to 5 times.
108	FAIL	Cannot turn on the 12-Volt power supply. <ol style="list-style-type: none"> 1. Verify 12-Volt Power Supply Test (#701) result (test card-mem). 2. If Test #701 fails, replace TN794 NetPkt or TN777B Netcon circuit pack. 3. Retry the command a 1-minute intervals, up to 5 times.
	PASS	Memory card directory files are sane.

CARR-POW (Carrier Port Power Unit) for AC-Powered Systems

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CARR-POW	MAJOR	recycle carrier PC	Carrier Port Power Unit

1 Recycle the carrier indicated by the PORT field in the Alarm Log.

DEFINITY Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

⇒ NOTE:

For environment maintenance, the aspects of a PPN configuration for a High or Critical Reliability system or of an EPN cabinet configuration are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate MO section(s).

- For a single-carrier cabinet system, refer to the “DC-POWER” Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: “AC-POWER”, “CUST-ALM (Customer-Provided Alarming Device)”, or “POWER (Battery & Battery Charger) for AC-Powered Systems”.
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: “AC-POWER (AC Power) for DC-Powered Systems”, “CUST-ALM (Customer-Provided Alarming Device)”, or “POWER (Battery & Battery Charger) for DC-Powered Systems”.

Every carrier in the system must be supplied with +5 volt, -48 volt, and -5 volt DC power for the various circuit packs to operate properly. This power is supplied to the carriers as follows: AC from a wall outlet comes into the PDU, which distributes the power via a set of fuses (F1 to F7) to the power units. Each carrier in the system is equipped with two power units: the 631 DA AC power unit and the 631 DB AC power unit, which together supply the required voltages to the carrier. Figure 10-12 illustrates the position of the power unit and the power distribution unit (PDU) and shows which power unit each fuse controls (Figure 10-12 also shows other Environment maintenance-related items that can be ignored for this section on Carrier Port Power Unit). Figure 10-13 illustrates the position of the power unit and the PDU and shows which power unit each fuse controls in a small cabinet (from a System 75 R1V3 upgrade). Figure 10-14

10 Maintenance Object Repair Procedures

CARR-POW (Carrier Port Power Unit) for AC-Powered Systems

10-388

shows the position of the fuses on the PDU and describes how to replace a fuse. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins. For more information, refer to the "Troubleshooting Backplane Voltage Problems" section found in Chapter 5, "Routine Maintenance Procedures".

The power unit has two LEDs: if the yellow LED is lit it means the power unit is operating as normal; if the red LED is lit it means the power unit has a fault; and if neither is lit it LED means no external power is being supplied. The CARR-POW (Carrier Port Power Unit) MO represents the pair of power units that power each carrier in a multicarrier cabinet system. If a problem is reported by hardware for a power unit on a port carrier, the system can recycle the pair of power units in a port carrier; however, if the problem is reported on a control carrier, the system cannot recycle the pair of power units in a control carrier. In a standard multicarrier cabinet (PPN or EPN) carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a High or Critical Reliability system multicarrier cabinet (PPN or EPN), carriers A and B are the control carriers, and carriers C, D, and E are the port carriers. However, carrier B can be recycled only if the Active Expansion Interface Link and Active Tone-Clock circuit pack are in the A carrier.

Loss of the 631 DB Carrier Port DC Power Unit in the active control carrier (the A carrier for a standard system and either the A or B carrier for a High or Critical Reliability system) causes loss of the administration terminal. In a High or Critical Reliability system, the Active SPE should switch to the Standby SPE if there is a CARR-POW alarm.

Recycling a carrier turns off the pair of power units, and turns them back on two seconds later.

WARNING:

Recycling carriers disrupts service for all circuit packs on the carrier.

The DEFINITY Generic 1 can also support neon message waiting lamps on analog telephones. If this is required, then the carrier(s) that contains the TN769 Analog Neon circuit packs must also be supplied with 165 volt to power the neon lights. The 165 volt can only be supplied by a TN752 or a TN755B power unit circuit pack.

The following table lists all power unit and power-related circuit packs for the system and indicates the voltages they can supply. Figure 10-12 through Figure 10-17 show a schematic of each power unit type. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the

backplane pins. Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104.

Table 10-164. DEFINITY power supplies

Power Supply	Output voltages				Cabinet Position
	+5	-48V	-5V	165V

Power Unit Replacement Procedures

If the power unit to be replaced is in a control carrier of a PPN system, refer to [“Replacing power supplies and fans”](#) in [Chapter 5, “Routine Maintenance Procedures”](#) before replacing the power unit.

1. Set the power switch to OFF, and unplug the power cord.
2. Move the locking slide on the power unit to its leftmost position and unlatch the locking lever.
3. Remove the power unit from the carrier.

10 Maintenance Object Repair Procedures

CARR-POW (Carrier Port Power Unit) for AC-Powered Systems

10-396

4. Before installing the replacement power unit in the carrier, turn the power unit on its side and operate rocker switches 1 through 4 on the dip switch as follows:

Switch	631AR Position	631BR Position
1	open	open
2	closed	closed
3	open	open
4	closed	open

 **NOTE:**

In the open position, the rocker is down on the side opposite the number. In the closed position, the rocker is down on the side adjacent to the number.

5. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
6. Insert the power unit into the carrier until some resistance is felt.
7. Lift the locking lever upward until it latches.
8. Move the locking lever slide on the power unit to the extreme right position.
9. Connect the power cord and set the power switch to ON.

Replacing a 631DA or 631DB AC Power Unit

If the power unit to be replaced is in a control carrier of a PPN system, refer to "Removing Power" and "Restoring Power" in Chapter 5, "Routine Maintenance Procedures" before replacing the power unit. To replace the power unit, follow the procedure below:

1. Unplug the power cord.
2. Move the locking slide on the power unit to the extreme left position and unlatch the locking lever.
3. Remove the power unit from the carrier.
4. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
5. Insert the power unit into the carrier until some resistance is felt.
6. Lift the locking lever upward until it latches.
7. Move the locking lever slide on the power unit to the extreme right position.
8. Connect the power cord and set the power switch to ON.

Replacing a TN736 or TN752 Power Unit Circuit Pack

If the TN736 or TN752 power unit circuit pack is in a control carrier of a PPN system, then refer to the [“Handling Control Circuit Packs”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#). Replacing either power unit interrupts the -5 volt supply to the carrier. This causes all the analog circuit packs in the carrier to fail their Loop Around Tests and may cause failures in circuit packs in the control complex. After the power unit has been replaced, look for alarms against these maintenance objects. If ANL-LINE alarms exist, refer to Test #47 (Loop Around and Conference Test) in ANL-LINE Maintenance documentation. For CO-TRK alarms, refer to Test #33 (Loop Around and Conference Test) in CO-TRK Maintenance documentation.

Hardware Error Log Entries and Test to Clear Values

Carrier Port Power Unit Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment P sh r 1
1(a)(b)	0 or 1	Power Unit Query Test (#127)	MAJOR	ON	test environment P r 2

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. Where P is an appropriate port network number taken for the PORT field of the Error Log.
- b. Run the Power Unit Query Test (#127) first using the **test environment P r 2** command. Then, if a carrier must be recycled to clear the CARR-POW alarm, use the **recycle carrier PC** command to run the Power Unit Recycle Test (#126). The Power Unit Recycle Test (#126) is not included in either the long or Short Test Sequences.

WARNING:

The Power Unit Recycle Test (#126) is destructive. For more information, refer to the description of this test.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78) (b)	X	X	ND
Power Unit Query Test (carrier E) (#127)	X	X	ND
Power Unit Query Test (carrier D) (#127)	X	X	ND
Power Unit Query Test (carrier A) (#127)	X	X	ND
Power Unit Query Test (carrier B) (#127)	X	X	ND
Power Unit Query Test (carrier C) (#127)	X	X	ND
Emergency Transfer Query Test (#124) (c)	X	X	ND
Cabinet Temperature Query Test (#122) (d)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

¹ D = Destructive; ND = Nondestructive

Notes:

- a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.
- b. Refer to AC-POWER (AC Power) Maintenance documentation for a description of this test.
- c. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.
- d. Refer to CABINET (Cabinet Sensors) Maintenance documentation for a description of this test.
- e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.
- f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test. This test only shows up in the test sequence if there is a TN768 Tone-Clock circuit pack in the port network being tested.

Power Unit Recycle Test (#126)

This test is destructive.

This test is destructive because it requires all circuit packs in the recycled carrier to be removed and inserted. These actions cause all calls originating or terminating on circuit packs in this carrier to be dropped. The pair of power units in the specified carrier is recycled. Both power units in the carrier are turned off for two seconds and then back on again. After the power units have been turned back on, the test queries the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of pair of power units in the specified carrier. If both power units are on and functioning, then the test passes. If both power units are not on and functioning, the test fails, and BOTH power units are turned off.

Table 10-165. TEST #126 Power Unit Recycle Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
1129	ABORT	Only occurs when recycling carrier 2B. Indicates that the Active Tone-Clock for the EPN is in carrier 2B. 1. Issue the set tone-clock 2A command. 2. Rerun the test.
1130	ABORT	Only occurs when recycling carrier 2B. Indicates that the Active Expansion Interface Link for the EPN is in carrier 2B. 1. Issue the set expansion-link A01 command. 2. Rerun the test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2029	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-165. TEST #126 Power Unit Recycle Test — Continued

Error Code	Test Result	Description/ Recommendation
1 (Carrier E) 2 (Carrier D) 4 (Carrier A) 8 (Carrier B) 16 (Carrier C)	FAIL	There is a problem with one or both Power Unit(s) on the recycled carrier. <ol style="list-style-type: none"> 1. Since the Power Unit Recycle Test failed, both Power Units in the recycled carrier should have been powered off by the system software. Both power units should be showing a red status LED, instead of a green one. Since the Power Unit Query Test is a subset of the Power Unit Recycle Test, the Power Unit Query Test (#127) should also fail. Run the Power Unit Query Test by using the test environment P command where P is the appropriate port network number. 2. If the test fails, follow the repair procedures described for Test #127. If problem persists, follow normal escalation procedures.
	PASS	Both power units in the recycled carrier were found to be healthy by the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system after the power units were powered down and back up. If the status LEDs on both power units are not showing green, then the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the power units. Look for and resolve any alarms on these MOs.

Power Unit Query Test (#127)

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of pair of power units in the specified carrier. If both power units are on and functioning, then the test passes. If both are not on and functioning, it fails.

Table 10-166. TEST #127 Power Unit Query Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at one minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to ABORT with error code 2000, check for system powering problems with the A carrier (PPN or EPN). Look for and resolve all AC-POWER and CARR-POW alarms in a multicarrier cabinet system or DC-POWER alarms in a single-carrier cabinet system. Then, repeat the test. 3. If the test continues to ABORT with a 2000 error code, check for and resolve all DUPINT (Duplication Interface) errors in a Duplicated Option PPN, PR-MAINT (Maintenance/Tape Processor) errors in a standard PPN, or MAINT (EPN Maintenance circuit pack) errors in an EPN. Then, repeat the test. 4. If the test continues to ABORT with a 2000 error code, escalate the problem.
2029	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-166. TEST #127 Power Unit Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	<p>There is a problem with one or both power units on the tested carrier.</p> <ol style="list-style-type: none"> For each power unit that has all status LEDs OFF, check the AC input to the power unit at the power unit outlet (see Figure 10-12 and Figure 10-13). If there is no AC, then check the appropriate fuses (see Figure 10-14) for the affected power unit. If the fuses are blown out, replace the fuses (see). If the fuses blow out again or AC does not show up at the power unit outlet, then there is probably a power wiring problem in the cabinet. Follow normal escalation procedures. At this point AC should be present at the power unit outlet. If the carrier being tested is the 1A or 2A carrier or the 1B carrier in a High or Critical Reliability system, refer to "Troubleshooting Control Carrier Power Units" in Chapter 5, "Routine Maintenance Procedures". Otherwise, use the recycle carrier PC command (where PC is the appropriate port network and carrier) in an attempt to bring back the power units for this carrier. <p>If the test passes, the trouble is cleared. If the test does not pass, one power unit, or both, in the tested carrier is defective.</p> <p>If only one power unit is defective, the status LEDs on the healthy power unit light green for a moment. When the recycle test determines that both power units are defective, the software turns off power to both the good and defective power units. This causes the status LED(s) on the good power unit to light red.</p> Unplug both power units, and wait about one minute to allow the power units to cool down. Plug in the power units. If either power unit is operating properly (that is, the status LEDs show green), then replace the defective power unit(s). See "Power Unit Replacement Procedures" in this section.

Continued on next page

Table 10-166. TEST #127 Power Unit Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL <i>(cont'd.)</i>	4. If the replaced power unit still does not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier may be causing an electrical load which is preventing the power unit from operating properly. Unseat all the circuit packs in the carrier and reissue the recycle carrier command. <ul style="list-style-type: none"> a. If the recycle passes, then the power units are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, replace the defective circuit pack. If the status LED still shows red, remove the Amphenol connector on the back of the slot containing this circuit pack and reissue the recycle carrier command. If the status LED shows green, the problem is with one of the telephones or the wiring to one of the telephones on this slot. If the status LED still shows red, escalate the problem. b. If either power unit still shows a red status LED, check for bent pins and cable placement in the affected carrier. There are failures that can occur on the Maintenance/Tape Processor, Duplication Interface, and EPN Maintenance circuit pack that are not detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If no other problems can be found, escalate the problem.
	PASS	Both power units in the tested carrier were found to be healthy by the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system. If the status LEDs on both power units are not showing green, the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the power units. Look for and resolve any alarms on these MOs.

CARR-POW (Carrier Port Power Unit) for DC-Powered Systems

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CARR-POW	MAJOR	recycle carrier PC	Carrier Port Power Unit

¹ Recycle the carrier indicated by the Port field in the Alarm Log.

Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

⇒ NOTE:

For environment maintenance, the PPN or EPN cabinet configuration aspects for a High or Critical Reliability system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate MO section(s).

- For a single-carrier cabinet system, refer to the “DC-POWER (Single-Carrier Cabinet Power)” Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: “AC-POWER (AC Power) for AC-Powered Systems”, “CUST-ALM (Customer-Provided Alarming Device)”, or “POWER (Battery & Battery Charger) for AC-Powered Systems”.
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: “AC-POWER (AC Power) for DC-Powered Systems”, “CUST-ALM (Customer-Provided Alarming Device)”, or “POWER (Battery & Battery Charger) for DC-Powered Systems”.

Every carrier in the system must be supplied with +5 volt, -48 volt, and -5 volt DC power for the various circuit packs to operate properly. A multicarrier system can be supplied by an external AC power source or an external DC power source.

In a DC-powered system, power is supplied to the carriers as follows: DC power from an external device comes into Power Distribution Units (PDU J58890CF and PDU J58890CF-1), which distribute the power via circuit breakers (CB1-CB12 for PDU J58890CF, CB1-CB6 for J58890Cf-1) to the carrier power units. Each carrier in the system is equipped with two power units, the 644A and the 645B, which together supply the required voltages to the carrier. Figure 10-17 illustrates the position of the carrier power units and PDU J58890CF and shows which power unit each circuit breaker controls (Figure 10-17 also shows other Environment

10 Maintenance Object Repair Procedures

CARR-POW (Carrier Port Power Unit) for DC-Powered Systems

10-405

maintenance-related items that can be ignored for this section on Carrier Port Power Unit). Figure 10-18 shows the position of the circuit breakers on the PDU J58890CF. Figure 10-19 illustrates the position of the carrier power units and PDU J58890CF-1 and shows which power unit each circuit breaker controls (Figure 10-19 also shows other Environment maintenance-related items that can be ignored for this section on Carrier Port Power Unit). Figure 10-20 shows the position of the circuit breakers on the PDU J58890CF-1. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins. Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104. The CARR-POW (Carrier Port Power Unit) MO represents the pair of power units for each carrier in a multicarrier cabinet system. If a problem is reported by hardware for a power unit on a port carrier, the system can recycle the pair of power units in a port carrier; however, if the problem is reported on a control carrier, the system cannot recycle the pair of power units in a control carrier. In a standard multicarrier cabinet (PPN or EPN), carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a High or Critical Reliability system multicarrier cabinet (PPN or EPN), carriers A and B are the control carriers, and carriers C, D, and E are the port carriers. However, carrier B in the EPN can be recycled only if the Active Expansion Interface Link and Active Tone-Clock circuit pack are in the A carrier.

The carrier port power unit has one LED: the yellow LED on means operating as normal and the LED off means no external power is being supplied or that the power unit has a fault.

Loss of the 645B Carrier Port Power Unit in the active control carrier (the A carrier for a standard system and either the A or B carrier for a High or Critical Reliability system) causes loss of the administration terminal. In a High or Critical Reliability system, the Active SPE should switch to the Standby SPE if there is a CARR-POW alarm.

Recycling a carrier turns off the pair of carrier power units and turns them back on two seconds later.

WARNING:

Recycling carriers disrupts service for all circuit packs on the carrier.

Generic 1 can also support neon message waiting lamps on analog telephones. If this is required, then the carrier(s) that contains the TN769 Analog Neon circuit packs must also be supplied with 165 volt DC power to power the neon lights. The 165 volt DC power can only be supplied by a TN752 or a TN755B power unit circuit pack. The following table lists the power units and power-related circuit packs that can be used in a DC-powered system and indicates the voltages they can supply. Figure 10-21 and Figure 10-22 show a schematic of the 644A and 645B power supplies, respectively. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins.

Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104.

Power Supply	+5V	-48V	-5V	165V	Cabinet Position
644A	yes	no	no	no	Left Side
645B	no	yes	yes	no	Right Side
TN736	no	no	yes	no	-
TN752	no	no	yes	yes	-
TN755B	no	no	no	yes	-

Figure 10-32. 644A Port Carrier Power Unit for DC-Powered Systems

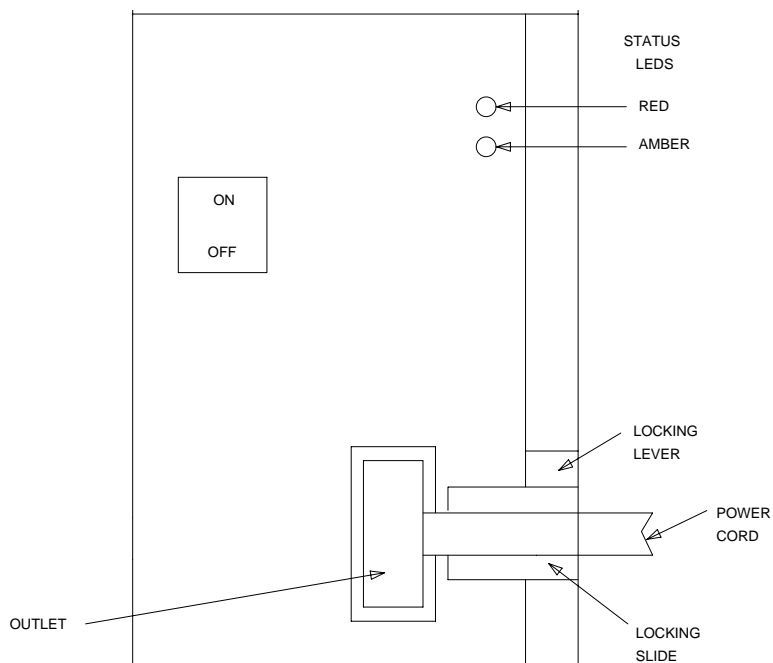

Figure 10-33. 645B Port Carrier Power Unit for DC-Powered Systems

Port Carrier Power Unit Replacement Procedures

The procedures for replacing a 644A or 645B carrier DC power unit are given below.

If the port carrier power unit to be replaced is in a control carrier of a PPN system, refer to the “Removing Power” and “Restoring Power” sections in Chapter 5, “Routine Maintenance Procedures” before replacing the port carrier power unit. To replace the port carrier power unit, follow the procedure below:

1. If this is a 645B power unit, set the power switch to OFF.
2. Unplug the power cord.
3. Move the locking slide on the power unit to the extreme left position, and unlatch the locking lever.
4. Remove the power unit from the carrier.
5. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
6. Insert the power unit into the carrier until some resistance is felt.

7. Lift the locking lever upward until it latches.
8. Move the locking lever slide on the power unit to the extreme right position.
9. Connect the power cord.
10. If this is a 645B power unit, set the power switch to ON.

Hardware Error Log Entries and Test to Clear Values

Carrier Port Power Unit Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test environment P sh r 1
1(a)(b)	0 or 1	Power Unit Query Test (#127)	MAJOR	ON	test environment P r 2

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. Where P is an appropriate port network number taken for the Port field of the Error Log.
- b. Run the Power Unit Query Test (#127) first using the **test environment P r 2** command. Then, if a carrier must be recycled to clear the CARR-POW alarm, use the **recycle carrier PC** command to run the Power Unit Recycle Test (#126). The Power Unit Recycle Test (#126) is not included in either the long or Short Test Sequences.

WARNING:

The Power Unit Recycle Test (#126) is destructive. For more information, refer to the description of this test.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND¹
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78) (b)	X	X	ND
Power Unit Query Test (carrier E) (#127)	X	X	ND
Power Unit Query Test (carrier D) (#127)	X	X	ND
Power Unit Query Test (carrier A) (#127)	X	X	ND
Power Unit Query Test (carrier B) (#127)	X	X	ND
Power Unit Query Test (carrier C) (#127)	X	X	ND
Emergency Transfer Query Test (#124) (c)	X	X	ND
Cabinet Temperature Query Test (#122) (d)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

¹ D = Destructive; ND = Nondestructive

Notes:

- a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.
- b. Refer to AC-POWER (AC Power) Maintenance documentation for a description of this test.
- c. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.
- d. Refer to CABINET (Cabinet Sensors) Maintenance documentation for a description of this test.
- e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.
- f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test.

⇒ NOTE:

This test only shows up in the test sequence if there is a TN768 Tone-Clock circuit pack in the port network being tested.

Power Unit Recycle Test (#126)

This test is destructive.

This test is destructive because it requires all circuit packs in the recycled carrier to be removed and inserted. These actions cause all calls originating or terminating on circuit packs in this carrier to be dropped. The pair of port carrier power units in the specified carrier is recycled. Both port carrier power units in the carrier are turned off for two seconds and then back on. After the port carrier power units have been turned back on, the test queries the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of the pair of port carrier power units in the specified carrier. If both port carrier power units are on and functioning, then the test passes. If both port carrier power units are not on and functioning, the test fails, and BOTH port carrier power units are turned off.

Table 10-167. TEST #126 Power Unit Recycle Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1129	ABORT	Only occurs when recycling carrier 2B. Indicates that the Active Tone-Clock for the EPN is in carrier 2B. 1. Issue the set tone-clock 2A command. 2. Rerun the test.
1130	ABORT	Only occurs when recycling carrier 2B. Indicates that the Active Expansion Interface Link for the EPN is in carrier 2B. 1. Issue the set expansion-link A01 command. 2. Rerun the test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2029	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-167. TEST #126 Power Unit Recycle Test — Continued

Error Code	Test Result	Description/ Recommendation
1 (Carrier E) 2 (Carrier D) 4 (Carrier A) 8 (Carrier B) 16 (Carrier C)	FAIL	There is a problem with one or both port carrier power units on the recycled carrier. <ol style="list-style-type: none"> 1. Since the Power Unit Recycle Test failed, both port carrier power supplies in the recycled carrier should have been powered off by the system software. Both port carrier power units should be showing a red status LED, instead of a green one. Since the Power Unit Query Test is a subset of the Power Unit Recycle Test, the Power Unit Query Test (#127) should also fail. Run the Power Unit Query Test by using the test environment P command where P is the appropriate port network number. 2. If the test fails, follow the repair procedures described for Test #127. If the problem persists, follow normal escalation procedures.
	PASS	Both port carrier power units in the recycled carrier were found to be healthy by the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system after the port carrier power units were powered-down and powered up again. If the status LEDs on both port carrier power units are not showing green, then the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the port carrier power units. Look for and resolve any alarms on these MOs.

Power Unit Query Test (#127)

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of the pair of port carrier power units in the specified carrier. If both port carrier units are on and functioning, the test passes. If both are not on and functioning, the test fails.

Table 10-168. TEST #127 Power Unit Query Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available.
2000	ABORT	Response to the test request was not received within the allowable time period.
2029	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	There is a problem with one or both port carrier power units on the tested carrier. 1. For each port carrier power unit that has all status LEDs OFF, check the DC input to the port carrier power unit at the port carrier power unit outlet (see Figures 11-19 through 11-22). If there is no DC, then check the appropriate circuit breakers for the affected port carrier power unit. If the circuit breaker has tripped (that is, it is in the down position), reset the circuit breaker. If the circuit breaker trips again or DC is not present at the port carrier power unit outlet, there is probably a power wiring problem in the cabinet. Follow normal escalation procedures. 2. At this point, DC should be present at the port carrier power supply outlet. If the carrier being tested is the 1A or 2A carrier, or the 1B carrier in a High or Critical Reliability system, refer to "Troubleshooting Control Carrier Power Units" Units" in Chapter 5, "Routine Maintenance Procedures". Otherwise, use the recycle carrier PC command (where PC is the appropriate port network and carrier) in an attempt to bring back the power units for this carrier. If the test passes, the trouble is cleared. If the test does not pass, one port carrier power unit, or both, in the tested carrier is defective. If only one port carrier power unit is defective, the status LEDs on the healthy port carrier power unit light green for a moment. When the recycle test determines that both port carrier power units are defective, the software turns off power to both the good and defective port carrier power units. This causes the status LED(s) on the good port carrier power unit to light red.

Table 10-168. TEST #127 Power Unit Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL <i>(cont'd.)</i>	<ol style="list-style-type: none"> 3. Unplug both port carrier power units, and wait about 1-minute to allow the port carrier power units to cool down. Plug in the port carrier power units. If either port carrier power unit is operating properly (that is, the status LEDs show green), then replace the defective port carrier power unit(s). See "Port Carrier Power Unit Replacement Procedures" in this section. 4. If the replaced port carrier power unit(s) still does (do) not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier could be causing an electrical load which is preventing the port carrier power unit from operating properly. Unseat all the circuit packs in the carrier, and reissue the recycle carrier command. <ol style="list-style-type: none"> a. If the recycle passes, then the port carrier power units are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, replace the defective circuit pack. If the status LED still shows red, remove the Amphenol connector on the back of the slot containing this circuit pack and reissue the recycle carrier command. If the status LED shows green, the problem is with one of the telephones or the wiring to one of the telephones on this slot. If the status LED still shows red, escalate the problem. b. If either port carrier power unit still shows a red status LED, check for bent pins and cable placement in the affected carrier. There are failures that can occur on the Maintenance/Tape Processor, Duplication Interface, and EPN Maintenance circuit pack that are not detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If no other problems can be found, escalate the problem.
	PASS	Both port carrier power units in the tested carrier were found to be healthy by the Maintenance/Tape Processor in a PPN for a High or Critical Reliability system, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system. If the status LEDs on both port carrier power units are not showing green, the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the port carrier power units. Look for and resolve any alarms on these MOs.

CLAN-BD (Control LAN Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CLAN-BD	MINOR	test board UUCSS long	Control LAN Circuit Pack
CLAN-BD	WARNING	test board UUCSS short	Control LAN Circuit Pack

- 1 UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).

Control LAN Circuit Pack

The TN799 Control LAN (CLAN) packet port circuit pack provides TCP/IP connection to adjuncts applications such as CMS, Intuity, and DCS Networking. The CLAN circuit pack has 1 10baseT Ethernet connection and up to 16 DS0 physical interfaces for PPP connections. Two integrated modems provide remote PPP connectivity over analog facilities. Putting multiple CLAN circuit packs into a system gives additional TCP/IP capacity. In addition to the TCP/IP functionality, CLAN extends the ISDN capabilities for csi models by providing Packet bus access.

A remote socket control link (RSCL) links the CLAN and the SPE to pass call control and other management information. Since one link serves all the ports on the circuit pack, maintenance of the RSCL is part of the CLAN circuit pack maintenance.

Control LAN Congestion Controls

The switch activates congestion controls on CLAN when it detects buffers exceeding the threshold. The switch releases the congestion controls when the CLAN reports that its buffer level has returned to normal levels.

If congestion:	Then the switch:
Persists for a 14-minute interval,	Raises MINOR alarm.
Exhausts buffers,	Raises MINOR alarm.
Ceases for 12 minutes,	Retires MINOR alarm.

Error Log Entries and Test to Clear Values

Table 10-169. CLAN-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value

Table 10-169. CLAN-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3842 (s)					
3844 (t)	Any				
3999 (p)	Any	None			

Notes:

- a. **Error Type 1:** Circuit pack stopped functioning or is not physically present.
 - 1. Verify that the circuit pack is present.
 - 2. If circuit pack is present, reset the circuit pack (**reset board UUCSS**).
 - 3. If the error persists, replace the circuit pack.
- b. **Error Type 18:** The CLAN circuit pack busied out.
- c. **Error Type 217:** applies to 3 circuit packs:

Circuit pack	Description
Maintenance/Test	More than one Maintenance/Test circuit pack in the port network
Tone Detector Call Classifier	More than 10 circuit packs in the system. 1. Remove the circuit pack(s) against which the error is logged.

- d. **Error Type 257:** Transient communication problem between switch and circuit pack; does not affect service and can be ignored.
 - 1. Ignore this error.

Repetitive failures of the Control Channel Loop Test indicate circuit pack hardware failure.
- e. **Error Type 513:** Circuit pack detected and reported hardware failure.
 - 1. Reset the circuit pack (**reset board UUCSS**).

Aux Data:

- 4352 External RAM error
- 4353 Internal RAM error
- 4355 ROM Checksum error
- 4356 Angel Message Corruption error
- 4357 Instruction set error

- f. **Error Type 769:** Logic error. By itself this error may be ignored, but it may report other error types.
- g. **Error Type 1291-1296:** Critical hardware or firmware error.

If the switch detects:	Then the switch:
1 error,	Resets circuit pack.
3 errors in 15 minutes,	Raises MINOR alarm.

Error Type descriptions are as follows:

- 1292 Internal hardware component failed
- 1293 Insane on-board auxiliary processor

1. Attempt to clear the alarm (**reset board UUCSS**).
 2. If alarm persists, replace circuit pack.
- h. **Error Type 1537:** Switch removed hyperactive circuit pack that reported threshold number of errors.
 1. Attempt to clear the alarm (**reset board UUCSS**).
 2. If the error recurs within 15 minutes, replace the circuit pack.
 - i. **Error Type 1793-1795:** Informational frame errors.

If the switch:	Then it:
Receives errors at defined rate.	Raises MINOR alarm on circuit pack.

Error Type descriptions are as follows:

- 1794 Packet bus transmit buffers has overflowed.

1. Attempt to clear the alarm (**reset board UUCSS**).
 2. If the error recurs within 15 minutes, replace the circuit pack.
- j. **Error Type 2049:** Packet Interface Test (#598) failed.
 1. Attempt to clear the alarm (**test board UUCSS I r 3**).

2. If alarm does not clear, reset the circuit pack (**reset board UUCSS**).
 3. If circuit pack resets, execute Packet Interface Test (#598) several times.
 4. If Packet Interface Test (#598) continues to fail, replace the circuit pack.
- k. **Error Type 2305-2306:** Error in received frame from packet bus.

Error Type:	Description
2305	Received invalid LAPD frame.
2306	Detected parity error on received frame.

Most likely cause—packet bus problem.

Other cause—circuit pack fault.

Invalid LAPD frame errors occur when the frame

- contains a bad Cyclic Redundancy Check (CRC),
 - is greater than the maximum length,
 - violates the link level protocol.
1. Retry the command (**test board UUCSS**) and see if the condition clears.
 2. If condition persists, execute PPE/LANBIC Receive Parity Error Counter Test (# 597) and determine if the condition clears.
 3. If condition persists, execute Packet Interface Test (# 598) to verify circuit pack integrity.
 4. If Packet Interface Test (# 598) fails, consult repair procedure for the packet bus.
- l. **Error Type 2561-2668:** System software received an indication that the socket was closed due to an error. Errors are reported as log only. Errors logged here are for the sockets that had *no* processor channels associated with them, for example, sockets to read SNMP data. The counter base is offset by the application type of the application associated with this socket that is down. The Aux Data field of the log entry contains this application's number, for example, a SNMP application would have its application number in the Aux Data field.
- m. **Error Type 2817-2819:** Congestion Query Test (#600) failed.

Below, Error Types correspond to descriptions.

- | | |
|------|------------------------------------|
| 2817 | All buffers exhausted. |
| 2819 | Utilized buffers exceed threshold. |

If:	Then:
Active buffers exceed threshold,	CLAN enters congested state.

1. Refer to Congestion Query Test (# 600) for Abort and Fail Error Codes.
- n. **Error Type 3073:** Remote Socket Control Link (RSCL) or Link Status Test (#1279) failed. This failure may be due to the
- circuit pack
 - packet bus
 - packet interface circuit pack .

If:	Then:
RSCL disconnects at link level	Link fails
Link cannot be reconnected quickly	Switch raises MINOR alarm

- o. **Error Type 3330:** Critical failure in Packet Bus interface.

Below, Error Types correspond to descriptions.

- | | |
|------|-------------------------------------|
| 1292 | Internal hardware component failed |
| 1293 | Insane on-board auxiliary processor |

If the switch detects:	Then it:
1 error,	Resets circuit pack.
2 errors in 15 minutes,	Raises MINOR alarm.

1. Attempt to clear the alarm (**reset board UUCSS**).
 2. If alarm persists, replace circuit pack.
- p. **Error Type 3586 and 3999:** Switch removed hyperactive circuit pack that reported threshold number of errors. One or more of the following symptoms may be present:
- Circuit pack port tests return NO BOARD.
 - List configuration command shows circuit pack and ports are installed properly

If Error Type 3999:	And traffic volume is:	Then:
Does not accompany Error Type 3586,	Heavy	Circuit pack is in service, but sent at least half hyperactive threshold. With heavy traffic, this is normal.
Does not accompany Error Type 3586,	Light	Circuit pack is in service, but sent at least half hyperactive threshold. With light traffic, this error indicates problem with circuit pack or its links.
Accompanies Error Type 3586,	Either Light or Heavy	Switch removed hyperactive circuit pack.

1. Busyout (**busyout board UUCSS**) and release (**release board UUCSS**) circuit pack
2. Allow 30 minutes for condition to clear itself.
3. To re-establish circuit pack into service manually, busyout (**busyout board UUCSS**), reset (**reset board UUCSS**), and release (**release board UUCSS**) the circuit pack.
4. If error recurs within 15 minutes, replace the circuit pack.
5. If the same error occurs on a different circuit pack, follow normal escalation procedures.

q. **Error Type 3840:** Bad control channel message from switch.

Aux Data:

- 4096 Bad major heading
- 4097 Bad port number
- 4098 Bad data
- 4099 Bad sub-qualifier
- 4100 State inconsistency
- 4101 Bad logical link
- 4102 Bad application identifier

r. **Error Type 3841-3843:** errors do not affect service.

Below, Error Types correspond to descriptions.

- 3841 Internal firmware error.
- 3843 Bad translation RAM. Call uses another translation location.

These errors do not affect service, however, they may cause reports of other errors that do affect service.

If Error Type 3843 begins to affect service, it escalates to Error Type 1296.

- s. **Error Type 3842:** Packet interface receive buffers overflowed.

If this error occurs frequently, the overflow may be congesting the circuit pack.

- 1. Refer to Receive FIFO Overflow Error Counter Test (#596).

- t. **Error Type 3844:** LAPD frame contains LAPD Protocol Error.

By themselves, these errors do not affect service.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate errors in the order they appear in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Control Channel Loop-Around Test #52	X	X	ND
Invalid LAPD Frame Error Counter Test #597		X	ND
PPE/LANBIC Receive Parity Error Counter Test #595		X	ND
Receive FIFO Overflow Error Counter Test #596		X	ND
Packet Interface Test #598	X	X	ND
Congestion Query Test #600	X	X	ND
PPP Link Status Inquiry Test #1279	X	X	ND

¹ D = Destructive; ND = Nondestructive

Circuit Pack Restart Test (#252)

This test is destructive.

Use this test (not part of either short or long demand test sequence) to reset the circuit pack only if there are PPCPU errors. The circuit pack resets through the SAKI Sanity Test (#53).

Control Channel Loop-Around Test (#52)

This non-destructive test fails if the circuit pack does not return to a sane state after being reset. This test queries the circuit pack for its code and vintage, and verifies its records.

Table 10-170. TEST #52 Control Channel Loop-Around Test

Error Code	Test Result	Description/ Recommendation
None 2100	ABORT	Could not allocate the necessary system resources to run test. 1. Retry the command at 1-minute intervals, up to 5 times.
	FAIL	The circuit pack failed to return the code or vintage. 1. Retry command at 1-minute intervals, up to 5 times. 2. a. If the test continues to fail with a Port circuit pack, reseal the circuit pack; otherwise, b. If the test continues to fail on SPE Processor Complex circuit packs, refer to <i>Replacing SPE Circuit Packs</i> in Chapter 5 (Responding to Alarms and Errors) to remove and reinsert the circuit pack.
	PASS	Test successful.

Circuit Pack Restart Test (#252)

This test is destructive.

Execute this test (not part of either short or long demand test sequence) to reset the circuit pack, only if there are PPCPU errors. This test fails if the circuit pack does not return to a sane state after being reset. The circuit pack resets through the SAKI Sanity Test (#53).

Table 10-171. Test #252 Circuit Pack Restart Test

Error Code	Test Result	Description/ Recommendation
None	ABORT	Could not allocate the necessary system resources to run test. 1. Retry the command at 1-minute intervals, up to 5 times.
1015	ABORT	Port is not out-of-service. 1. Busyout the circuit pack (busyout board UUCSS). 2. Retry the command at 1-minute intervals, up to 5 times.
2100	ABORT	Could not allocate the necessary system resources to run test. 1. Retry the command at 1-minute intervals, up to 5 times.

Table 10-171. Test #252 Circuit Pack Restart Test — Continued

Error Code	Test Result	Description/ Recommendation
1, 2	FAIL	The circuit pack failed to reset. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, pull out and reseal the circuit pack. 3. If the problem persists, replace the circuit pack.
	PASS	The circuit pack initialized correctly.

PPE/LANBIC Receive Parity Error Counter Test (#595)

This test is non-destructive. When the CLAN circuit pack detects a parity error with a received frame, it increments the PPE/LANBIC Receive Parity error counter. This test reads and clears the counter, and may verify repair of problem.

Errors may indicate a problem with

- a circuit pack
- a packet bus
- another circuit pack on the bus

Table 10-172. TEST #595 PPE/LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If the problem persists, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run test.
2500	ABORT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times.

Continued on next page

Table 10-172. TEST #595 PPE/LANBIC Receive Parity Error Counter Test — Continued

Error Code	Test Result	Description/ Recommendation
1-10	FAIL	Circuit pack detects parity errors. The Error Code indicates the value of the on-board error counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times. 2. If the test continues to fail, execute the Packet Interface Test (#598) (test board UUCSS). 3. If Packet Interface Test (#598) fails, see Packet Bus repair procedures.
	PASS	Circuit pack detects no errors.

Receive FIFO Overflow Error Counter Test (#596)

This test is non-destructive. When the CLAN circuit pack detects packet bus buffer overflow, it increments the error on the FIFO Overflow error counter. This test reads and clears the counter.

If errors are:	Then they may be due to:
Occasional	Statistical buffer sizing
Persistent	Circuit pack congestion that requires redistribution of traffic load

Table 10-173. TEST #596 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If the problem persists, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run test.
2500	ABORT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times.

Continued on next page

Table 10-173. TEST #596 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description/ Recommendation
1-10	FAIL	Circuit pack detects overflow errors. The error code indicates the value of the on-board error counter. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals, up to 5 times.2. If the test continues to fail, execute the Packet Interface Test (#598) (test board UUCSS).3. If Packet Interface Test (#598) fails, refer to Packet Bus repair procedures.
	PASS	Circuit pack detects no errors.

Invalid LAPD Frame Error Counter Test (#597)

This test is non-destructive.

CLAN detects invalid frames when it receives

- a frame with a CRC error
- an unrecognizable frame
- a recognizable frame in an unexpected state

When the CLAN circuit pack detects an invalid LAPD frame, it increments the Invalid LAPD Frame error counter. This test reads and clears the counter, and verifies the repair of the problem.

Errors may indicate a

- circuit pack problem
- packet bus problem
- problem with another circuit pack on the bus

Table 10-174. TEST #597 Invalid LAPD Frame Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If the test fails again, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2500	ABORT	Internal system error. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times.
1-10	FAIL	The circuit pack detects LAPD frame errors. The error code indicates the value of the on-board error counter. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals, up to 5 times. 2. If the test continues to fail, execute the Packet Interface Test (#598) (test board UUCSS long). 3. If Packet Interface Test (#598) fails, refer to Packet Bus repair procedures.
	PASS	Circuit pack detects no errors.

Packet Interface Test (#598)

This non-destructive test checks the packet bus interface circuitry on the CLAN circuit pack. Test failure indicates faulty circuit pack.

Table 10-175. TEST #598 Packet Interface Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. <ol style="list-style-type: none"> 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If the test fails again, replace the circuit pack.

Continued on next page

Table 10-175. TEST #598 Packet Interface Test — Continued

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Could not allocate the necessary system resources to run test.
2100	ABORT	Internal system error. 1. Retry the command at 1-minute intervals, up to 5 times.
	FAIL	Circuit pack has detected a failure of the Packet Interface Test (#598). 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If the test continues to fail, replace the circuit pack.
	PASS	The Packet Interface Test (#598) passed.

Congestion Query Test (#600)

This non-destructive test queries the number of used buffers to determine if the CLAN circuit pack is congested.

If:	Then:
Used buffers are, or are nearly, exhausted,	The test fails
The test fails,	The switch redirects outgoing calls to another available CLAN, and denies new incoming calls

Normal call handling resumes when the CLAN circuit pack has recovered from congestion.

Table 10-176. TEST #600 Congestion Query Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Did not receive circuit pack test response within the allowable time period. 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If the test fails again, replace the circuit pack.

Table 10-176. TEST #600 Congestion Query Test — Continued

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Could not allocate the necessary system resources to run test.
2100	ABORT	Internal system error. 1. Retry the command at 1-minute intervals, up to 5 times.
1	FAIL	The buffer level is nearly exhausted.
2	FAIL	The CLAN is congested, and no buffers are available. 1. Retry command at 1-minute intervals, up to 5 times. 2. If command continues to fail, examine the CLAN port measurements to determine which ports are heavily utilized and the processor occupancy of the circuit pack. <i>Low processor occupancy</i> when CLAN congested indicates circuit pack failure. 1. If the problem persists, reset the circuit pack (reset board UUCSS). 2. If congestion recurs, replace the circuit pack. <i>High processor occupancy</i> indicates the CLAN is congested due to traffic load. 1. Busyout the circuit pack (busyout board UUCSS) to relieve congestion selectively. 2. Consider replacing affected CLAN ports with new ports.
3	FAIL	The CLAN circuit pack is operating normally and is not congested.
	PASS	Hardware setting and attached cable type match CLAN circuit pack administration.

Link Status Test (#601)

This non-destructive test sends a test frame over the signaling link to determine whether the CLAN call control signaling link is connected.

Table 10-177. TEST #601 Link Status Test

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Could not allocate the necessary system resources to run this test.
2100	ABORT	Internal system error. 1. Retry command at 1-minute intervals, up to 5 times.
2	FAIL	The RSCL control link disconnected. 1. Retry command at 1-minute intervals, up to 5 times. 2. If the test continues to fail, execute the Packet Interface Test (#598) to determine if the problem is due to the circuit pack. 3. If the Packet Interface Test (#598) fails, refer to Packet Interface Test repair procedures. 4. If the Packet Interface Test (#598) fails, refer to Packet Control Circuit Pack and Packet Bus repair procedures.
3	FAIL	Received no response to RSCL control link test frame. 1. Retry command at 1-minute intervals, up to 5 times. 2. If the problem persists, reset the circuit pack (reset board UUCSS). 3. If test continues to fail, replace the circuit pack.
	PASS	RSCL control link connected.

CLSFY-BD (Call Classifier Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CLSFY-BD	MIN	test board PCSS sh	Call Classifier Circuit Pack
CLSFY-BD	WRN	test board PCSS sh	Call Classifier Circuit Pack

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also Call Classifier Port (CLSFY-PT) Maintenance documentation for related port information.

CLSFY-PT (Call Classifier Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CLSFY-PT(a)	MAJOR	test port PCSSpp sh	Call Classifier Port Maintenance
CLSFY-PT	MINOR	test port PCSSpp sh	Call Classifier Port Maintenance
CLSFY-PT	WARNING	release port PCSSpp	Call Classifier Port Maintenance

¹ Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (e.g., A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (e.g., 01, 02, ..., etc.); and pp is the 2-digit port number (e.g., 01).

The TN744 Call Classifier (CLSFY-BD) circuit pack is a service circuit pack that enables usage of the Outbound Call Management (OCM) and the Inbound Call Management (ICM) features. On a G3iV2-386 system, the TN744 also enables usage of R2-MFC signaling for incoming and outgoing feature operation. There are eight ports (CLSFY-PTs) on the Call Classifier circuit pack. Each port can handle call classification, touch-tone reception, or, for G3iV2-386 systems, MFC tone generation and detection or touch-tone reception.

The CLSFY-PT maintenance feature defines a set of tests to ensure that the Call Classifier circuit pack ports are capable of detecting tones for call classification, and detecting and generating necessary tones for correct MFC feature operation.

Hardware Error Log Entries and Test to Clear Values

Table 10-178. Call Classifier Port (CLSFY-PT) Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1	any	Tone Detector Audit/Update Test (#43)	MAJOR/ MINOR (a)	ON	test port PCSSpp r 2
18		Port has been busied out by system technician	WARNING	OFF	release port PCSSpp
257 (b)	17666	Test (#43)	MAJOR/ MINOR(a)	ON	test port PCSSpp r 3
513 (c)	any	Tone Detection Verification Test (#42)	MAJOR/ MINOR (a)	ON	test port PCSSpp r 3

Notes:

- a. There are two possible alarm levels for this error type: major alarm and minor alarm. A major alarm is raised if the total number of call classifier ports currently in-service is less than or equal to 1/2 of the administered threshold number. Otherwise, a minor alarm is raised. In either case, run the short test sequence against the port and follow the error code procedures for the individual tests.

The threshold number of call classifier ports for service is administered using the **change system-parameters maintenance** command. For details, refer to Chapter 5, "Routine Maintenance Procedures".

- b. The call classifier port lost its translation. Testing the call classifier port is sufficient to reload its translation. If testing the call classifier port does not clear the error, then the call classifier circuit pack containing the defective call classifier port should be replaced.
- c. This error indicates the call classifier port is having problems detecting system tones (DTMF, etc.) or detecting and generating necessary R2-MFC tones. This error should accompany some percentage of failed calls. If this error type is persistently logged, then the call classifier circuit pack containing the defective call classifier port should be replaced.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *Tone Detection Verification Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
Tone Detection Verification Test (#42)	X	X	ND
Tone Detection Audit/Update Test (#43)	X	X	ND

¹ D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks out each port in both the touch-tone receiver mode and in the R2-MFC tone detection/generation mode. During the first half of the test, the touch-tone receiver mode is tested. In the second half of the test, each port is put into the R2-MFC mode. During this portion of the test, each port's ability to accurately detect and generate all forward and backward MFC tones is verified.

Table 10-179. TEST #42 Tone Detection Verification Test

Error Code	Test Result	Description/ Recommendation
none	ABORT	The system was not able to allocate all the resources needed for this test OR there was an Internal System Error.
1	ABORT	The system could not allocate all the resources needed to test the tones.
1001	ABORT	The system was unable to put the Call Classifier port in the appropriate mode to test it.
1002	ABORT	<p>The system could not allocate time slots for the test connection. This situation could occur when the system is heavily loaded. If the system is not heavily loaded, then test the TDM-BUS via the test tdm [1 2] command. Refer to the TDM-BUS (TDM Bus) Maintenance documentation for details.</p> <ol style="list-style-type: none"> 1. Retry the command at one minute intervals a maximum of 5 times.
1003	ABORT	<p>The system could not allocate a Tone-Clock circuit pack for the test connection. This situation could occur when the system is heavily loaded or if a Tone-Clock circuit pack is not present in the port network when this test is executed.</p> <ol style="list-style-type: none"> 1. Verify the existence of a Tone-Clock circuit pack in the same port network. 2. If a Tone-Clock circuit pack is missing, install one in the same port network. 3. Allow approximately one minute for the Tone-Clock circuit pack maintenance to run on the newly inserted Tone-Clock circuit pack. 4. Retry the command at one minute intervals a maximum of 5 times.
2006	ABORT	<p>This abort code indicates that the active Tone-Clock circuit pack might not be functioning properly. If there is more than one Tone Detector circuit pack in the system, then the problem can be either with the Tone-Clock circuit pack or the Tone Detector circuit pack. This could also be caused by the companding mode administered for the system not matching that of the Tone Detector circuit pack [G3iV2-386].</p> <ol style="list-style-type: none"> 1. [G3iV2-386] Make sure that the companding mode of the system matches that of the Tone Detector (TN748 for Mu-law systems and TN420 for A-law systems). 2. Test the active Tone-Clock circuit pack in the port network. This test is being executed via the test tone-clock qualifier system technician command. ("qualifier" is the carrier of the active Tone-Clock circuit pack to be tested. Valid qualifiers are: a, b, 1a, 1b, 2a, and 2b.) Refer to the TONE-BD (Tone-Clock Circuit Pack) Maintenance documentation for details. 3. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-179. TEST #42 Tone Detection Verification Test — Continued

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1-3	FAIL	DTMF digits were not detected correctly. This may or may not impact reception of R2-MFC calls. 1. Run the short test sequence via the test port PCSSpp sh r 1 command. 2. If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore system performance to normal, replace the Call Classifier circuit pack containing the defective CLSFY-PT (Call Classifier Port).
101-122	FAIL	Forward or Backward MFC signals were not correctly generated or detected. This impacts reception of incoming MFC calls. 1. Run the short test sequence via the test port PCSSpp sh r 1 command. 2. If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore system performance to normal, replace the Call Classifier circuit pack containing the defective CLSFY-PT (Call Classifier Port).
	PASS	Tone Detection Verification is successful. The Call Classifier Port (CLSFY-PT) is able to detect/generate all necessary tones.

Tone Detector Audit/Update Test (#43)

A sanity audit is performed on the CLSFY-PT (Call Classifier Port).

Table 10-180. Tone Detector Audit/Update Test (#43)

Error Code	Test Result	Description/ Recommendation
none	ABORT	The system was not able to allocate all the resources needed for this test. 1. Wait 1-minute, and repeat the command a maximum of 5 times.

Continued on next page

Table 10-180. Tone Detector Audit/Update Test (#43) — Continued

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Hardware audit failed. 1. Run the short test sequence via the test port PCSSpp sh r 1 command. 2. If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore system performance to normal, replace the CLSFY-BD (Call Classifier circuit pack) containing the defective CLSFY-PT (Call Classifier Port).
	PASS	The (CLSFY-PT) Call Classifier Port has passed the sanity inquiry.

CO-BD (Central Office Trunk Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CO-BD	MIN	test board PCSS sh	Central Office Trunk Circuit Pack
CO-BD	WRN	test board PCSS sh	Central Office Trunk Circuit Pack

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also CO-TRK (CO Trunk) Maintenance documentation for related trunk information.

CO-DS1 (DS1 CO Trunk)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
CO-DS1	MAJOR ¹	test trunk <grp/mbr> l	DS1CO Trunk
CO-DS1	MINOR	test trunk <grp/mbr> l	DS1CO Trunk
CO-DS1	WARNING	test trunk <grp/mbr>	DS1CO Trunk

- 1 A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

A DS1CO (central office) trunk provides a communications channel between the system and a central office switch through either a 1.544 Mbps or a 2.048 Mbps [G3iV2-386] DS1 link. A 24 channel DS1 link consists of 24 digital DS1CO trunks. A 32 channel DS1 link [G3iV2-386] consists of 30 digital DS1CO trunks. A DS1CO trunk can be used for both voice and data communication.

The DS1CO Trunk Maintenance provides a strategy in the system to maintain a CO trunk via a port on the DS1 Interface circuit pack. The TN767 and TN464 [G3iV2-386] DS1 Interface circuit packs support the low level CO trunk signaling interfaces, ground-start and loop-start. This strategy covers the in-line errors log, initialization tests, periodic tests, system technician-demanded tests, and alarm resolution and escalation.

Three trunk service states are specified in the DS1CO trunk maintenance. They are: *out-of-service* in which the trunk is in a deactivated state and cannot be used for either incoming or outgoing calls; *in-service* in which the trunk is in an activated state and can be used for both incoming and outgoing calls; *disconnect* (ready-for-service) in which the trunk is in an activated state but can only be used for an incoming call. If the DS1 Interface circuit pack is out-of-service, then all trunks on the DS1 Interface circuit pack are also in the out-of-service state, and a Warning alarm is raised for each trunk.

Hardware Error Log Entries and Test to Clear Values

Table 10-181. DS1 CO Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 ¹	0	Any	Any	Any	test trunk <grp>/<mbr>
1 (a)	57408				

Table 10-181. DS1 CO Trunk Error Log Entries — Continued

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	57487				
15 (b)	Any	Port Audit and Update Test (#36)			
18 (c)	0	busyout trunk <grp>/<mbr>	WARNING	OFF	release trunk <grp>/<mbr>
130 (d)		None	WARNING	ON	test trunk <grp>/<mbr>
257 (e)	57392	DS1 CO Dial Tone Seizure Test (#314)	MIN/MAJ ²	OFF	
513 (f)	57393	DS1 CO Dial Tone Seizure Test (#314)	MIN/MAJ ²	OFF	
769 (g)	57484				
1025		DS1CO Dial Tone Seizure Test (#314)	WARNING	OFF	test trunk <grp>/<mbr>
1281		Conference Circuit Test (#7)	MAJ/MIN/WRN ³	ON	test trunk <grp>/<mbr> r 4
1537		NPE Crosstalk Test (#6)	MAJ/MIN/WRN ³	ON	test trunk <grp>/<mbr> r 3
1793 (h)				ON	test board PCSS I
2562(i))	16665				
2817(j)	52992				
3840 (k)		Port Audit and Update Test (#36)			

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 This alarm will only be raised when the System-Parameter Country form has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.
- 3 Minor alarms on this maintenance object (MO) may be downgraded to Warning alarms based on the values used in the **set options** command. If the Minor alarm is not downgraded by the **set options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this group are alarmed.

Notes:

- a. Error Type 1—Aux Data 57408—No tip ground is detected on an outgoing call.

Aux Data 57487—PBX could not get “loop close” signal (TN767).

The DS1 Interface circuit pack detected a hardware fault. These errors cause the Dial Tone Test (#314) to run and are only considered a problem if the Dial Tone Test fails (in which case Error Type 1025 also shows up). In this case, the trunk may be put in ready-for-service state (shown as “disconnected” by status command), which allows only incoming calls. Run the Dial Tone Test (#314) and follow its outlined procedures.

- b. Error Type 15—This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).
- c. Error Type 18—System Technician has busied-out the trunk to the out-of-service state. No calls can be made on this trunk except the Facility Access Test Call. For details on this feature, refer to “Facility Test Calls” section in Chapter 5, “Routine Maintenance Procedures”.
- d. Error Type 130—This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- e. Error Type 257—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type: 57392—no external release on PBX disconnect [E030]. Escalate the problem.
- f. Error Type 513—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type: 57393—belated external release on PBX disconnect [E031]. Escalate the problem.
- g. Error Type 769—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type:—57484, fault is detected on tip/ring [E08C]. Escalate the error.
- h. Error Type 1793—DS1 Interface circuit pack is out-of-service. Look for DS1-BD errors in the Hardware Error Log. Refer to the DS1-BD (DS1 Trunk Circuit Pack) Maintenance documentation for details.
- i. Error Type 2562—Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.
- j. Error Type 2817—Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a two-way trunk from both the near-end and the far-end. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure Test (#314) and follow those procedures.
- k. Error Type 3840—Port Audit and Update Test (#36) failed due to an internal system error. Enter the **status trunk** command to verify the status of the trunk. If the trunk is out-of-service, then enter the **release trunk** command to put it back into in-service. Retry the test command. If the test continues to abort, then escalate the problem.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

For example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk Test (#6)		X	ND
Conference Circuit Test (#7)		X	ND
DS1CO Trunk Seizure Test (#314)	X	X	ND
Port Audit and Update Test (#36)	X	X	ND

¹ D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) resides on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-182. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-182. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/ Recommendation
1000	ABORT	<p>System resources required to run this test were not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1001	ABORT	<p>System resources required for this test are not available.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to the TDM-BUS (TDM Bus) Maintenance documentation to diagnose any active TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some tone detectors may be out-of-service.</p> <ol style="list-style-type: none"> 1. Look for TTR-LEV errors in the Error Log. If present, refer to TTR-LEV (TTR Level) Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to TONE-PT (Tone Generator) Maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
1004	ABORT	<p>The port was seized by a user for a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.

Table 10-182. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/ Recommendation
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2053	ABORT	At least one of the following errors was found on the DS1 circuit pack: loss of signal (1281), blue alarm (1793), red alarm (2049), yellow alarm (2305), or hyperactivity (1537). 1. Look for the above error types in the Hardware Error Log and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.
	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk, or external wiring.

Table 10-182. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see note below).</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted. <p>⇒ NOTE: Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the list config command but the 'Vintage' field reports that there is no board (when there really is a board), then the busyout board and the release busy board commands will not work (even though the reset board command will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p>

Conference Circuit Test (#7)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

Table 10-183. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	The test was aborted. System resources required to run this test were not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1002	ABORT	The test was aborted. The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. Refer to the TDM-BUS (TDM bus) maintenance documentation to diagnose any active TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic and the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some of the tone detectors may be out of service. Issue the list measurements tone-receiver command to display basic information about the system's tone receivers. 1. Look for TTR-LEV errors in the error log. If present, refer to the TTR-LEV maintenance documentation. 2. Look for TONE-PT errors in the error log. If present, refer to the TONE-PT maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals for a maximum of 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use the status station or status trunk command to determine when the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, and the port is not in use, escalate the problem.

Table 10-183. TEST #7 Conference Circuit Test — Continued

Error Code	Test Result	Description/ Recommendation
1018	ABORT	The test was disabled via translation. You may want to determine why the test has been disabled before you enable it. <ol style="list-style-type: none"> 1. Verify that the 'Maintenance Test' field on the 'Trunk Administration' screen is set to 'n.' To enable the test, change the trunk administration and enter 'y' into the 'Maintenance Test' field. 2. Repeat the test.
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. <ol style="list-style-type: none"> 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
2053	ABORT	At least one of the following errors was found on the DS1 circuit pack: loss of signal (1281), blue alarm (1793), red alarm (2049), yellow alarm (2305), or hyperactivity (1537). <ol style="list-style-type: none"> 1. Look for the above error types in the Hardware Error Log and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.

Continued on next page

Table 10-183. TEST #7 Conference Circuit Test — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	<ol style="list-style-type: none"> 1. Enter the list configuration board PCSS command. If the circuit pack is a TN767B vintage 8 or 9, replace the circuit pack with a TN767C V3 or later. The error log may have error type 1281 entries. 2. Test all administered trunks on the board. If one fails, this could be an off-board problem (such as an incoming seizure or an off-hook port seizure during the test). Retest the board. 3. If all of the ports fail, check the CARR-POW (see Note below). 4. If several ports fail, check the error log for TONE-BD or TONE-PT errors. If there are such errors, take the appropriate action. When the TONE errors have cleared, rerun the test. 5. If the retry passes and troubles have been reported, coordinate isolation with the CO. Make sure that the switch, the CO, and any NTCE equipment (the CSUs) have the correct administration. 6. Replace the circuit pack. <p>⇒ NOTE: If the conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance Documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance Documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack.</p>
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

Continued on next page

Table 10-183. TEST #7 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board).</p> <p>This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see note below).</p> <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. <p>This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> <p>⇒ NOTE: Hyperactivity causes some special problems with the sequence suggested above. The software will put the hyperactive board back in service after the hyperactivity clears.</p>

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the DS1 Interface circuit pack to assure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk kept in the DS1 Interface circuit pack and in the switch software.

Table 10-184. TEST #36 Port Audit and Update Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	The test was aborted because system resources required to run this test were not available. The port may be busy with a valid call. Issue the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	FAIL	Test failed due to internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent. If the trunk is busied out, the test does not run, but returns to PASS. To verify that the trunk is in-service: 1. Enter status trunk command to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to Step 2. 2. Enter release-trunk command to put trunk back into in-service. 3. Retry the test command.

Table 10-184. TEST #36 Port Audit and Update Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	<p>The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see note below).</p> <ol style="list-style-type: none">1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found.2. If the board was found to be correctly inserted in step 1, issue the busyout board command.3. Issue the reset board command.4. Issue the release busy board command.5. Issue the test board long command. <p>This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> <p>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the list config command but the 'Vintage' field reports that there is no board (when there really is a board), then the busyout board and the release busy board commands will not work (even though the reset board command will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p>

DS1 CO Dial Tone Seizure Test (#314)

DS1CO Dial Tone Seizure Test checks the trunk's signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a "seizure" message to the DS1 Interface circuit pack and expects an "active" reply from the DS1 interface circuit pack. If the "active" message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a "reorder" message back to maintenance software, then the test fails.

The test **CANNOT** be run on a trunk if one of the following cases is true:

- a. The trunk direction is administered as an incoming only trunk.
- b. The trunk has been seized by a normal trunk call.
- c. The trunk is administered with maintenance test disabled.

Table 10-185. TEST #314 DS1CO Dial Tone Seizure Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	The test was aborted because system resources required to run this test were not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1004	ABORT	The test was aborted because the port was seized by a user for a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1005	ABORT	Test failed due to incompatible configuration administered in trunk group form. 1. Verify the following fields on the trunk group administration screen: Is trunk direction incoming only? Is trunk the port 24 of the DS1 Interface circuit pack while common control channel signaling is specified? Is trunk group type the automatic CO (for example, FX)? 2. If the trunk has been administered using the above information, then this test should abort.
1018	ABORT	The test is disabled via translation. You may want to determine why the test has been disabled before you enable it. 1. Verify that the 'Maintenance Test' field on the 'Trunk Group' form is set to 'n'. To enable the test, issue the change trunk-group x command (x equals the number of the trunk group to be tested). Then, change the entry in the 'Maintenance Test' field on the form to 'y'. 2. Repeat the test.

Continued on next page

Table 10-185. TEST #314 DS1CO Dial Tone Seizure Test — Continued

Error Code	Test Result	Description/ Recommendation
1020	ABORT	The DS1 Interface circuit pack is out-of-service. 1. Look for DS1-BD errors in the Hardware Error Log. If present, refer to DS1-BD (DS1 Trunk Circuit Pack) Maintenance documentation. 2. Retry the command.
1040	ABORT	The test was aborted because this port may be an access endpoint. 1. Verify that this port is an access endpoint by issuing the display port command. 2. If the port has been administered as an access endpoint, then this is a normal abort.
2000	ABORT	Response to the test request was not received within the allowable time period.
2012	ABORT	The test was aborted due to an internal system error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	The trunk cannot be seized for an outgoing call. This could cause in-line failures to be reported against the trunk (no answer would report error type 257 with auxiliary data 57487 in the error log). 1. Verify that the Trunk Type field on the trunk administration screen form matches the trunk type administered on far end switch. 2. Look for DS1-BD/UDS1-BD errors in Hardware Error Log. If present, refer to the appropriate DS1-BD/UDS1-BD (DS1/UDS1 Trunk Circuit Pack) Maintenance documentation. 3. Retry the test at 1-minute intervals for a maximum of 5 times.
2000	FAIL	Response to the seizure message was not received within the allowable time period. 1. Enter the list configuration board PCSS command. If the circuit pack is a TN767B vintage 8 or 9, a failure of test 314 causes a subsequent failure of test 7 due to a firmware bug. Eventually, the board and all of its ports will be taken out of service and extraneous on-board alarms will be generated. Replace the circuit pack with a TN767C V3 or later. 2. Verify that the 'Trunk Type' field on the 'Trunk Administration' screen matches the trunk type administered on far-end switch. 3. Look for DS1-BD or UDS1-BD errors in the hardware error log. If present, refer to the DS1-BD (DS1 trunk circuit pack) maintenance documentation or to the UDS1-BD (UDS1 trunk circuit pack) maintenance documentation. 4. Retry the test at 1-minute intervals for a maximum of 5 times.

Table 10-185. TEST #314 DS1CO Dial Tone Seizure Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2053	FAIL	At least one of the following errors was found on the DS1 circuit pack: loss of signal (1281), blue alarm (1793), red alarm (2049), yellow alarm (2305), or hyperactivity (1537). <ol style="list-style-type: none"> 1. Look for these error types in the hardware error log and then follow the procedures given in the maintenance documentation that is appropriate for the error type that was found.
	PASS	The trunk can be seized for an outgoing call.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see Note below). <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Use the list config command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board long command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted. <p>⇒ NOTE: Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the list config command but the 'Vintage' field reports that there is no board (when there really is a board), then the busyout board and the release busy board commands will not work (even though the reset board command will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p>

CO-TRK (CO Trunk)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run ¹	Full Name of MO
CO-TRK	MAJOR ²	test port PCSSpp l	CO Trunk
CO-TRK	MINOR	test port PCSSpp l	CO Trunk
CO-TRK	WARNING	test port PCSSpp l	CO Trunk

- 1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); c is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.).
- 2 A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

⇒ NOTE:

If ATMS testing is enabled, check the error log for ATMS Errors #3840 and #3841. If the error log indicates that measurements exceeded acceptable thresholds, and if no other trouble is found with the **test trunk** command, run the ATMS test call with the **test analog-testcall port PCSSpp full** command.

Central Office (CO) trunks are 2-wire analog lines to the CO which support both incoming and outgoing calls. A CO trunk circuit pack provides an interface between the 2-wire analog line from the CO and the system's (4-wire) Time Division Multiplex (TDM) Bus. The CO Trunk circuit packs include:

- TN747B (United States), 8 port loop start or ground start CO, foreign exchange (FX), or Wide Area Telecommunications (WATS) trunks.
- TN438B (Australia), 8 port loop start.
- TN447 (United Kingdom), 8 port ground start.
- TN465 (multiple countries), 8 port loop start.
- TN2138 (Italy), 8 port loop start.
- TN2147 (multiple countries), 8 port loop start and United Kingdom Earth Calling or Loop Calling Guarded Clearing.

LOOP START AND UK LOOP CALLING GUARDED CLEARING OPERATION

Idle State - Tip _ ground, Ring = CO Battery

A. Outgoing Call

1. PBX Off-Hook (Seize Message): Closes the Tip-Ring Loop
 - a. CO Response: DC loop current + Dial tone

2. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
 - a. CO Response: CO goes to idle state (see Note)

B. Incoming Call

1. CO Applies Ringing Voltage
 - a. PBX Response: Detect ringing current
2. PBX Off-Hook (Answer Message): Close loop
 - a. CO Response: Trip ringing, provide loop current
3. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
 - a. CO Response: CO goes to idle state (see Note)

NOTE:

Except for the Netherlands Loop Start and UK Loop Calling Guarded Clearing trunks, CO does not normally provide an On-Hook (Disconnect) signal.

GROUND START AND UK EARTH CALLING OPERATION

Idle state - Tip _ open, Ring = CO Battery

A. Outgoing Call

1. PBX Off-Hook (Seize Message): Places ground on Ring
 - a. CO Response: Places ground on Tip
 - b. PBX Response: close the loop
 - c. CO Response: provide loop current
 - d. PBX response: dial out digits
2. PBX On-Hook first (Drop Message): Open the Tip-Ring Loop, no loop current
 - a. CO Response: Open circuit on Tip
3. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current.
 - a. PBX Response: Open Tip-Ring loop

B. Incoming Call

1. CO Off-Hook (Seizure): CO applies ground on Tip, CO applies ringing voltage
 - a. PBX Response: Detect ringing, ring destination
2. PBX Off-Hook (Answer Message): Close loop
 - a. CO Response: Trip ringing, provide loop current

3. PBX On-Hook first (Drop Message): Open the Tip-Ring Loop, no loop current
 - a. CO Response: Open circuit on Tip
4. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current

Hardware Error Log Entries and Test to Clear Values

Table 10-186. CO Trunk Error Log Entries

Continued on next page

Table 10-186. CO Trunk Error Log Entries — Continued

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
2817 (d)	57484	Dial Tone Test (#0)	MAJ/MIN/ WRN ²	OFF	test port PCSS l r 1
3073 (d)	57376	None			
3329 (d)	57408	None			
3329 (d)	57484	Dial Tone Test (#0)	MAJ/MIN/ WRN ²	OFF	test port PCSS l r 1
3585 (d)	57424	None			
3840 (f)	8000	Analog Transmission (#844-848)		OFF	
3841 (f)		Analog Transmission (#844-848)	MINOR	OFF	test analog testcall UUCSS pp r 2

- 1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- 2 Minor alarms on this MO may be downgraded to warning alarms based on the values used in the **set options** command. If the Minor alarm is not downgraded by the **set-options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this trunk group are alarmed.

Notes:

- a. These are in-line errors that have no specific test associated with them. Refer to Table 10-93 for an explanation and appropriate action.
- b. This is a software audit error that does not indicate any hardware malfunction. Run the Short Test Sequence and investigate associated errors (if any).
- c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- d. Aux data 57345 -- Single polarity ringing current
 Aux data 57376 -- No loop current on incoming call
 Aux data 57408 -- No tip ground detected on outgoing call
 Aux data 57424 -- No loop current on outgoing call
 Aux data 57484 -- No dial tone on outgoing call

These errors cause the Dial Tone Test (#0) to run and are only considered a problem if the Dial Tone Test fails (in which case Error Type 1537 also shows up). In this case, the trunk may be put in "Ready-for-Service" state

(shown as “disconnected” by status command), which allows only incoming calls. Run the Dial Tone Test (#0) and follow its outlined procedures.

If error count associated with this error type is very high (that is, 255) and if Alarm Status on the Hardware Error Report is “n” (not alarmed), then the existence of this error type indicates that, despite the fact that many in-line error messages have been received, all Call Seizure Tests have passed. Problems at the CO may cause this condition rather than problems with the PBX.

- e. These errors are logged for all versions of the CO-TRK/CO-BD. However, no MINOR alarms are generated for Central Office Trunks [TN747B] with vintages V8 or greater. Any failures received by this test are still logged as Error type 1025/1281 as additional information for the system technician person.

The system technician person should check for the use of MFT/Range extenders. If there are extenders present, and there are no other complaints or maintenance errors against this trunk, then there is a good chance that Test #3 failed due to excessive loop current and may be ignored.

- f. Test calls made by the Automatic Transmission Measurement System (ATMS) returned measurements that were outside the acceptable limits. Use the **list testcall detail** command to examine specific transmission parameters that are out of spec, and investigate the trunk for that kind of noise. If the noise is acceptable, the limits administered on the “change trunk” screen should be changed.

Table 10-187. CO Trunk Errors with NO Tests

Error Type	Aux Data	Description and System Action	System Technician Action
1	57347	Port error. Ringing without ground. This error is detected on an incoming call on a ground-start CO trunk. The CO trunk circuit pack has not detected a Tip ground before ringing current is detected. This may indicate that the ground detector is not working. However, the call is accepted.	See Note 1 at end of table.

Continued on next page

Table 10-187. CO Trunk Errors with NO Tests — Continued

Error Type	Aux Data	Description and System Action	System Technician Action
257	50176	Battery reversal detected. This is usually caused by the CO (often seen with step-by-step and cross-bar offices in connection with outgoing calls). This is detected if the direction of the loop current changes from normal to reverse for at least 40 msec. Could occur if the trunk was just installed and for some reason the Tip and Ring wires were reversed at the PBX. If battery reversals occur during dialing, wrong numbers may result. The CO should be asked to remove the battery reversal option.	Refer problem to CO.
513	57364	Ground detector stuck active. After several occurrences, an on-board minor alarm is generated.	Run short test. If test aborts with Error Code 1000, disconnect Tip and Ring and repeat short test. If test still aborts, replace circuit pack. If test passes, refer problem to CO. If any other error code is received, pursue that problem.
769	57392	CO not releasing after call is dropped from PBX end (off-board alarm after several occurrences), or the loop is not open after a disconnect (on-board alarm after several occurrences).	For off-board alarm, refer problem to CO. For on-board alarm, the circuit pack has an on-board problem (for example, stuck relay) and should be replaced.
2561	57345	Single polarity ringing current. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) Another cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the dial tone test also fails. The last cause could be that certain types of noise are present on the CO line during the silent period of ringing.	Check for other errors first and then see Note 4 at end of table.

Continued on next page

Table 10-187. CO Trunk Errors with NO Tests — Continued

Error Type	Aux Data	Description and System Action	System Technician Action
2817	57360	Ground but no ringing. This error occurs on an incoming call on a ground-start trunk. If ringing is not detected within 5 seconds of the Tip being grounded, the call is still accepted. If the CO is of the No. 5ESS switch type, ringing delays of more than 5 seconds during heavy traffic are fairly common.	Check for other errors.
2817	57393	On the TN465, the loop is opening too slowly after a disconnect. This error indicates an on-board problem, although the trunk may be functional. On the TN2138, CO released the trunk at least 4 minutes after the PBX dropped the call. This error code is log-only and causes no other testing to occur. No alarm is generated.	Check for other errors.
3073	57376	No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the dial tone test and all outgoing calls should also fail.	Check for other errors.
3329	57408	Trunk error. No Tip ground detected on outgoing call. This error occurs when an attempt is made to seize a ground-start CO trunk for an outgoing call and Tip ground is not detected or the caller hangs up before Tip ground is detected.	See Notes 1 and 2 at end of table.
3585	57424	No loop current on outgoing call. This error occurs on attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected.	See Note 3 at end of table.

Notes:

1. At the administration terminal, busyout the affected port, and run a Long Test Sequence. Observe the test results. If any tests fail, refer to the description of the tests and the associated error codes. Release the port. If users continue to report troubles, check for other errors and make test calls to determine whether the problem should be escalated or referred to the CO.

2. At the administration terminal, busyout the affected port, and run a Long Test Sequence. If Dial Tone Test #0 passes, ignore this error. Release the port.
3. At the administration terminal, busyout the affected port, and run a Long Test Sequence. If CO Demand Diagnostic Test #3 passes and this error keeps occurring, refer problems to CO. Release the port.
4. If the error count associated with this error type is very high (that is, 255) and all tests pass, then either the reverse current detector is defective or the CO line is noisy. If the CO line is suspected, Tip and Ring observations should be made. If the line is determined to be noisy, the problem should be referred to the CO. If the reverse current detector is defective, ignore this error.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

For example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND ¹
NPE Crosstalk Test (#6)		X	ND
Dial Tone Test (#0)		X	ND
CO Demand Diagnostic Test (#3) (a)	X	X	ND
Loop Around and Conference Test (#33)		X	ND
Audit Update Test (#36) Analog Transmission Test (#844-848) (b)	X (c)	X (c)	ND

1 D = Destructive; ND = Nondestructive

Notes:

- a. A demand test of Diagnostic Test (#3) always returns a PASS indication for CO-TRK/CO-BD [TN747B] version 8 or greater. However, any errors produced as a result of this test are logged and produce no alarms.

If errors logged by Test #3 are the only complaints against this trunk, then the system technician person should check if MFT/Range Extenders are being used. If extenders are present, then there is a good chance that there is excessive loop current, which causes Test #3 to log errors.

However, all else being normal, these errors should not affect the customer.

- b. Refer to TIE-TRK (Tie Trunk) Maintenance documentation for a description of this test.
- c. ATMS test are not part of either sequence. They are run either on demand with the **test analog-testcall** command or via the ATMS schedule.

Dial Tone Test (#0)

This test attempts to seize a port and checks for the return of a dial tone.

Table 10-188. TEST #0 Dial Tone Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the command display port PCSSpp to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required to run this test were not available. This could be due to a failure to seize the port. 1. Retry the command at 1 minute intervals for a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) Maintenance documentation to diagnose any active TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-188. TEST #0 Dial Tone Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	<p>The port was seized by a user for a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none">1. If the port status is idle, retry the command at 1 minute intervals for a maximum of 5 times.
1005	ABORT	<p>Trunk has been administered as incoming-only; dial tone can only be obtained on outgoing trunks. This is a normal condition.</p>
1018	ABORT	<p>Test has been disabled via administration.</p> <ol style="list-style-type: none">1. Verify that the "Maintenance Tests?" field on the Trunk Group Form is set to "n". To enable the test, issue the change trunk-group x command where "x" equals the number of the trunk group to be tested. Then change the entry in the "Maintenance Tests?" field on the form to "y."
2000	ABORT	<p>Response to the test was not received within the allowable time period.</p> <ol style="list-style-type: none">1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-188. TEST #0 Dial Tone Test — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	<p>Trunk was seized, but dial tone could not be detected.</p> <ol style="list-style-type: none"> 1. Test all administered outgoing ports on the board. Failure of 1 indicates a problem toward the CO. 2. If all fail, see note below. 3. Check for errors on the TONE-BD or TONE-PT. Clear any errors found, and repeat the test. 4. If the error has still not cleared, refer the problem to the CO. 5. If no service problems exist on the port, continue to use the port until the circuit pack can be replaced (as a last resort). Perform a trunk test call to see if the trunk is operable. <p>⇒ NOTE: If the dial tone test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation.</p>
2002	FAIL	<p>Seizure portion of test failed due to hardware problem. Fault is usually caused by a disconnected trunk.</p> <ol style="list-style-type: none"> 1. If the CO Demand Diagnostic Test (#3) also failed, display the Hardware Error Log. If the CO Demand Diagnostic Test failed because it could not detect ground (indicated by Error Type 1281 in the Hardware Error Log) AND Error Type 3329 or 3585 appears in the Hardware Error Log (with the same last occurred time as Error Type 1281 and 1537), replace the circuit pack. 2. Check trunk wiring to ensure good connection; repeat test if wiring correction made. 3. Locate another identical CO trunk and swap its wiring with one under test. Repeat test on both trunks and determine if problem follows trunk or remains at original port. If problem follows trunk, refer problem to CO. If problem remains at port, replace circuit pack and repeat test. 4. If replacing circuit pack does not clear failure, escalate the problem.

Table 10-188. TEST #0 Dial Tone Test — Continued

Error Code	Test Result	Description/ Recommendation
1009	PASS	Detected tone was not pure dial tone. [G1, G3iV1.1-286] No action required.
	PASS	Trunk was seized, and dial tone was detected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). <ol style="list-style-type: none">1. Check to ensure that the board translations are correct. Translate the board, if necessary.2. Issue the busyout board command.3. Issue the reset board command.4. Issue the release busy board command.5. Issue the test board command. This should re-establish the linkage between the internal ID and the port.

CO Demand Diagnostic Test (#3)

For ground start trunks only, port circuit pack relays are operated and checks are made to see if the port can detect and apply ground on the Tip lead. This test also verifies that there is no external ground on the Ring lead. In the absence of other failures, the circuit pack should be replaced only if this test fails with the CO line disconnected.

For the TN2147 World Class Central Office circuit pack, this test also checks the on-board programmable transmission circuitry that allows the circuit pack to support the transmission characteristics of several countries.

Table 10-189. TEST #3 CO Demand Diagnostic Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate system resources to run this test. <ol style="list-style-type: none">1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 10-189. TEST #3 CO Demand Diagnostic Test — Continued

Error Code	Test Result	Description/ Recommendation
1000	ABORT	<p>System resources required to run this test are not available. The port may be busy with a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	<p>The port was seized by a user for a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. If the port status is idle, retry the command at 1 minute intervals for a maximum of 5 times.
1005	ABORT	<p>Test inapplicable to present configuration. This is a normal condition.</p>
1018	ABORT	<p>Test has been disabled via administration.</p> <ol style="list-style-type: none"> 1. Verify that the "Maintenance Tests?" field on the Trunk Group Form is set to "n". To enable the test, issue the change trunk-group x command where "x" equals the number of the trunk group to be tested. Then change the entry in the "Maintenance Tests?" field on the form to "y."
2000	ABORT	<p>Response to the request was not received within the allowable time period.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-189. TEST #3 CO Demand Diagnostic Test — Continued

Error Code	Test Result	Description/ Recommendation
	FAIL	<p>Failure to detect ground or faulty ground detected on Ring lead. Display the hardware errors for this trunk, to determine if the fault was on- or-off board. Look for Error Type 1025 or 1281 (if both appear in the Hardware Error Log, pick the most recent error). Error Type 1025 indicates a faulty ground detected on Ring lead (an off-board fault) and Error Type 1281 indicates failure to detect (internally generated) ground (an on-board fault). Faulty ground detected on Ring lead (Error Type 1025):</p> <p> NOTE: On TN747B vintage 8 and greater circuit packs, an incoming seizure during this test may cause it to fail with an off-board fault.</p> <ol style="list-style-type: none"> 1. Repeat test. If test passes, ignore the original failure. If test aborts, follow the recommended procedures. 2. Repeat test with CO line removed. 3. If test fails, replace the circuit pack. 4. If test passes, refer problem to CO. <p>Failure to detect ground (Error Type 1281):</p> <ol style="list-style-type: none"> 1. Run the long test sequence. If the CO Demand Diagnostic Test fails, the Dial Tone Test (#0) fails with Error Code 2002, AND Error Type 3329 or 3585 appears in the Hardware Error Log (with the same last occurred time as Error Type 1281 and 1537), replace the circuit pack. 2. Repeat test with CO line removed. 3. If test fails, replace the circuit pack. 4. If test passes, the CO may be drawing too much current. Refer problem to CO.
57481	FAIL	<p>On-board test of programmable transmission circuitry failed.</p> <ol style="list-style-type: none"> 1. Replace the circuit pack.
	PASS	<p>This test verifies that the port is able to apply ground for outgoing calls and detect ground for incoming calls; however, it does not provide information on whether a CO line is actually connected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.</p>

Table 10-189. TEST #3 CO Demand Diagnostic Test — Continued

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). <ol style="list-style-type: none"> 1. Check to ensure that the board translations are correct. Translate the board, if necessary. 2. Issue the busyout board command. 3. Issue the reset board command. 4. Issue the release busy board command. 5. Issue the test board command. This should re-establish the linkage between the internal ID and the port.

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one way and noisy connections may be observed. This test is usually only part of a port's long test sequence and takes approximately 20 to 30 seconds to complete.

Table 10-190. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 10-190. TEST #6 NPE Crosstalk Test — Continued

Error Code	Test Result	Description/ Recommendation
1000	ABORT	<p>The port was seized by a user for a valid call. Use the display port PCSSpp command to determine the trunk group/member number of the port. Use the status trunk command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"> 1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the Error Log table for a description of this error and required actions). The port may be locked up. Check the CO wiring, check for excessive loop current, and check the trunk translations. (If the trunk is translated incorrectly, this test will abort.) 2. If the port status is idle, busyout and release the trunk, and then retry the command at 1 minute intervals for a maximum of 5 times. 3. If the test still aborts, replace the circuit pack.
1001	ABORT	<p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"> 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	<p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM-Bus) Maintenance documentation to diagnose any active TDM-BUS errors.</p> <ol style="list-style-type: none"> 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	<p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some tone detectors may be out-of-service.</p> <ol style="list-style-type: none"> 1. Look for TTR-LEV errors in the Error Log. If present, refer to TTR-LEV Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to TONE-PT Maintenance documentation. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.
